The making of Batch 27 begins at Ganesh Chemicals Corporation. Jethalal Chaturbhuj Soni is its sole proprietor and he manufactures and supplies what is called 'chalu glycerine'. The 'chalu' glycerine is glycerine for industrial purposes. It is usually classified into two grades, one of which is for the manufacture of writing ink, stamp pad ink, typewriter ink and the other which is used in the textile industry. Neither of the two grades is however fit for human consumption as both contain diethylene glycol.

Soni's *modus operandi* was simple. He brought large drums from hawkers or reused drums in which he received raw material. He painted these 250 kg drums in red and on the lids he stencilled 'Glycerine Not For Medicinal Use'. This was not out of any altruistic reason but to obtain exemption under schedule K of the Drug Act.

A BSc in chemistry from Gujarat university, Soni admitted that his glycerine was not up to ISI standards but was a substitute glycerine. He admitted his product was the result of his own formula and could not be found in any recognised

textbook or Merck Index. In terms of market price, it was 50 per cent cheaper than Industrial White (IW) glycerine.

Now glycerine is a dual purpose item. IP glycerine is produced in terms of the standards prescribed by the Indian pharmacopoeia. For IW glycerine no standards are laid unless a firm claims an ISI mark.

Soni's product was not glycerine. It was a mix of sorbitol and diethylene glycol with a touch of glycerine. Soni "admitted that unless he called his product glycerine, he would not get the same price as he would get merely from the sale of sorbitol or ethyl glycol". He also added that "he never indicated either by any document or on the drum of his product that it was a substitute for glycerine". Nor did he identify the commodity though he was required to do so under the Weights and Measures Act but pleaded "ignorance of the rules framed under the act". Soni also insisted that all his customers knew what his product really was.

Mahender Doshi of H M Chemicals purchased this product from Soni and supplied it to Kailash and Company. Doshi however disclaimed all responsibility by stating he never took responsibility for "the glycerine sold by him" and that "purchasers bought from him at their own risk". But Doshi knew that the product was adulterated. The market price for glycerine was close to Rs 50 per kg and Doshi knew that the glycerine he was purchasing from Soni was a substandard item. Doshi failed to warn his customers that it could not be used for medicinal purposes and in that sense was selling a misbranded drug.

We now come to the role of Alpana Pharma and its patron Ramanlal Karwa. Karwa was an M Pharm from Nagpur University. A student of the 1975 batch, he was fortunate to have as his colleagues several FDA officers. He started a series of manufacturing concerns and one of these was a repacking firm called Alpana Pharma. He appointed Om Prakash Ladda, a cousin of his wife Nirmala, as head. But Alpana Pharma was "a creation and a creature of Karwa". It was established at Nanded, a backward area to avail itself of government concessions.

In March 1984, Alpana Pharma applied for a repacking licence for 212 drugs. In three days the drug inspectors had inspected the unit's premises, and four days later the FDA had recommended a grant of licence to Alpana Pharma, an efficiency that the Commission found 'breathtaking'. Now all one required was a resident chemist and an in-house laboratory.

Om Prakash Ladda in his statement before the Commission admitted that Alpana Pharma had not the slightest intention of setting up a quality control laboratory or to appoint a qualified chemist. He admitted that "such an undertaking was given not because he wanted to honour it but because the FDA required it". By December 1985, he had bought some equipment but with these only two of the sixteen tests for glycerine could be performed. In fact these two – the colour and the description test – did not require any equipment at all. The Commission's evaluation of Ladda is devastating.

> To start with, he admits that before he started his repacking operation, he did not draw any sample from the two drums received by him, nor did he send any sample from these two drums for analysis. Negligence. Though according to him, the repacking from these two drums was done under his personal supervision, he admitted that he did not examine the actual contents of the drums before commencing the repacking process. Negligence. The excuse given by him that it was not possible to do so while the glycerine was actually in the drum, is too absurd to countenance. He stated that when he was repacking this glycerine it was colourless and did not smell of burnt sugar. This is false because the Government Analyst's report reveals that the glycerine was pale yellow in colour. This shows that O P Ladda had not bothered even to see what his casual labourers were repacking. He admitted that between the time that the glycerine was repacked and the sample sent to the Government Analyst, it did not change colour because glycerine does not change colour. He also agreed that pure glycerine is odourless whereas the report of the Government Analyst showed that the sample smelt of burnt sugar, that chemical odour would not generally be of burnt sugar and that he has never come across a single instance where glycerine used for medical purposes smelt of burnt sugar. These admissions are further pointers that the repacking was not done under O P Ladda's supervision, his protestation in his evidence to the contrary notwithstanding. If only O P Ladda had taken the elementary precaution of seeing what was being repacked instead of leaving the operation to his casual labourers, he would have realised that what was being repacked smelt of burnt sugar and even lacked the colour of glycerine. This should have put him on his guard. Thus even this elementary care and precaution O P Ladda did not care to take. Negligence.... Thus it was only on January 29, 1986 after the J J Hospital tragedy, it dawned on O P Ladda that what he had repacked was not for medicinal use. Even so, and though indisputably his Batch No 24 also contained diethylene glycol, he did not take any step to inform any of his purchasers about this.

But it was not only a case of negligence. O P Ladda was a conniving unscrupulous man. He realised that he needed certificates which showed that his samples had been tested. So Ladda sent samples for analysis which did not have any relation to the one which he was ultimately going to purchase. By this jugglery, he was always one step ahead and did not have to wait for the analytical report, as an advanced sample was sent for analysis of a batch yet to be received or purchased for (p 163).

Realising the sequence of events, this nexus of four firms decided to absolve themselves of their liability by framing another firm. They entered into a conspiracy to forge invoices and other documents to show that the drum was obtained from Edgar Hanley and Company. They claimed that the two 250 kg drums were actually stored in that Company's warehouse, a ruse that fortunately failed to work.

The Commission noted that all the four firms were responsible. Doshi, Kasat and Ladda knew that the concoction was adulterated but the evidence did not establish that they knew it was diethylene glycol. They were merchants in adulteration and merchants of death but the Commission reluctantly held that they behaved "without intention of causing death".

There was a last irony. Under the Indian penal code the punishment for such grave crime is only two years imprisonment, but spotting a ray of hope the Commission noted that the penalty for manufacturing, sale and distribution of drugs in contravention of Chapter V is five years extendable to life. It recommended that Soni, Kasat, Doshi and Ladda be prosecuted under the second statute.

The Commission then investigated the laboratory in question.

Chem Med was one of those lovely structures out of a macabre *Alice in Wonderland*. Established in 1961, it had 300 regular clients and a 1,000 casual clients. The glorious history of Chem Med makes fascinating reading. It prepared about 1500 failure reports every year. Under the rules these reports had to be submitted to the FDA. However Chem Med avoided this through a simple ruse. It reclassified these as reports on 'experimental samples' because such reports were not required by the FDA. As a result only 5 to 10 per cent of the samples analysed were declared as substandard. Interestingly no record of substandard samples was maintained.

Chem Med received its samples from Alpana Pharma and commenced work on

November 8, 1985. The work was done by Rekha Pai, a trainee who admitted that she 'would not have been able to do her analysis work on her own'. Glycerine to qualify for the IP grade requires sixteen tests and Chem Med certified that Batch No 27 had cleared all (pp 173-75).

The Commission notes that not only did the FDA's initial reports challenge this but that Chem Med's general record persuaded one in this direction. The latter indicated three possibilities: (a) that the tests were not carried out; (b) that if conducted, they were not carried out properly; (c) that in any event in order to avoid displeasing the client standard quality reports were typed out and sent to Alpana Pharma. But either way one thing is clear. Chem Med's reports 212/213 on Alpana Pharma's Batch 27 were 'false and bogus'.

Chem Med were masters at this game. As Lentin observed "Chem Med is proud possessor of a previous history of manipulating reports and with the benevolence of FDA virtually getting away with it". In a rare burst of candour Chem Med's managing partner Sipahimalani disclosed the secret of keeping FDA officials "happy and purring with contentment". He described it as an 'exercise in spreading happiness and contentment among FDA officials'.

The Commission held that in fact "any upright FDA officer immediately on receiving Chem Med's reports and protocols ... would have vigorously proceeded against Chem Med including listing it as co-accused". None of this was done thanks to high ranking FDA officials, "two powerful officers who bestowed their benevolence on an erring analytical laboratory", but 'surely not for love'.

The Commission's investigations of the laboratory reveals the only person who felt guilt during the entire proceedings. Rekha Pai was a student trainee chemist who discovered that she had 'analysed' Batch 27 while working at Chem Med. She left the 'employment of Chem Med after she read in the newspapers about the J J Hospital deaths as a result of glycerol certified by Chem Med... Being a very emotional person she was extremely upset when she read this and gave up her chosen profession as a trainee chemist and has since then not taken up this profession". Rekha Pai became a receptionist at Hinduja Hospital. But even Pai fobs off her responsibility on to a senior chemist. Unfortunately she blamed one who was not even present on the day of analysis. But in the entire report she stands as the one person who admitted to a sense of remorse and guilt.

Struggling with these reports one also senses that everyday modern technology – in medicine, transport, housing – is seen as outside the ethical framework. It is not the old idea of the immediate visibility of cause and effect. There is somehow a sense that a wrong chemical result, or a substandard drug are things floating in air. There is no notion of responsibility attached to them. These individuals may be horrified by one murder but a statistical trend is seen as abstract. Adulteration of a drug is seen neither as a technological or moral failure. It seems to float unconnected, disembedded, without ganglions of responsibility.

This is why there is an almost complete absence of horror among the witnesses, or even guilt. They read death as if it were a mistake in traffic signals. The right word, the right signal can erase the crime. Moral responsibility in an impersonal sense does not seem to exist. You have no rituals for it. Morality is for friends, classmates, neighbours, ancestors. They are ritually tied into a concrete frame. A consumer, a potential patient, are remote categories, unless the consumer or patient is a friend or neighbour.

In fact there is a sense of anomic about these domains. The reader feels he is traversing a no-man's land or a fragment of absurd drama. By this time he realises that not one of the people investigated accept guilt, feel grief. What one encounters is evasion, erasure, indifference, amnesia. There is a sense that one is traversing spaces where no one cares. It raises two sets of difficult questions. Is there something about these spaces that makes them amoral? Has modernity, especially through the creation of bureaucracies, altered the moral universe?

There is a quiet sense of evil which increases as one enters the FDA. It is here that *The Lentin Report* creates both a sense of despair and dread. There is a process of dehumanisation that leaves Lentin helpless. It is as if a framework of ethical relationships has collapsed especially in the bureaucratic domain. What is worse rules and procedures are turned into facile meccano sets for manipulation.

Lentin's motto is like Richard Hoggarts' famous appeal, 'only connect'. For Lentin it is precisely this politics of community that is missing. This report is not only an invitation to be angry but to wonder why we fail to be concerned with other people in the everydayness of bureaucratic life. Here caring is not concrete. It is not X and Y. It could be any member of the alphabet. How do we create caring in this more abstract sense? How do we face up to the amoralism of the bureaucracy?

Years ago Edward Banfield wrote a book on *The Moral Basis of a Backward Society*.[4] In that he coined the term 'amoral familism' which became almost as famous as Oscar Lewis' 'culture of poverty'. Both these concepts however got implicated in the developmentalist discourse with its arrogance, its racism. But there is a core of fruitfulness and truth we might rescue. Banfield who made his studies on Sicily asked himself the question, why do people respond to public spaces in a certain way. He noticed that family spaces were sacrosanct, morally coded but anything beyond is a no-man's land. You keep your house clean but throw garbage across the wall. You donate blood for friend and kin but not to a stranger. Similarly with corruption. You use the bureaucracy to help kith and kin and manipulate the rest of the world. The question one must ask is whether corruption is a part of bureaucratic amoralism, that decrees that any one in instrumental, rational legal space is or can be 'targeted'. One senses this more as one enters the FDA.

VI

The FDA is the controlling agency of an industry with an annual turnover of 2,000 crores. It is vested with the power "to ensure public health and safety by properly regulating the manufacture, sale and distribution of drugs and preventing the manufacture, sale and distribution of substandard, spurious and mis-branded drugs".

The FDA is a gargantuan labyrinth. In Maharashtra itself there were 3,500 licence units and another 4,000 loan licence manufacturers. The latter manufacture drugs in the premises of licensed owners using also their staff. Merely 10 per cent of these units had in-house testing facilities. But loopholes were affably easy as manufacturers were given licences on the written assurance that they would have in-house testing facilities within two months. Inspection of drugs was a herculean task. For instance in the 10,000 sq km in Nanded area where Alpana Pharma was located, one inspector had to look after 306 drug selling units and sixteen manufacturing units.

The Commission considers the FDA at two levels, firstly as an organisation. In terms of a system of rules and regulations, the Commission found little that was wrong with it. Once one of the finest organisations in Asia, it has been subverted to serve the interests of the politician and industry. It is in examining this that the Commission encounters the question of evil in a blatant way and wading through this section one

discovers something disturbing. It is what one might call a Tolstoyean twist to the problem. Tolstoy begins one of his greatest book stating. "Happy families are all alike, unhappy ones are different each in their own way". In The Lentin Report, honest people look alike but dishonest ones are each corrupt in their own way. One feels that goodness follows rules period. It is corruption that seems continuously inventive, even reflective as it plays around with the nature of organisations.

How does one describe the personnel of the FDA? The characters that appear in the story Dolas, Kochar, Bhirud, Kulkarni are each a separate layer, a series of distinct masks, each one more corrupt than the other, all culminating in the evil genius of Jt Commissioner S J Dolas. Let us begin with Kochar. One must see each character as a repertoire of strategies.

Kochar is the diverter.

Assistant Commissioner Kochar of the Intelligence branch knew almost immediately that the prime source of supply was Ganesh Chemicals. While Ganesh Chemicals itself had no clout with FDA, it obtained an advantage because Kochar was determined to save Giridhar Kasat. Instead of taking positive steps to further the investigation, the intelligence officer ordered an investigation into Bakewell India. He simultaneously filed a defective complaint against Alpana Pharma suppressing the fact that it was Ganesh Chemicals that was the prime supplier. In his need to save Kasat, Kochar made a false statement inculpating Bakewell India as prime supplier knowing full that Bakewell's glycerine which came from Italy was not the killer glycerine of Batch 27. Kochar even tried to blame the containers indirectly on the ground that they were made of plastic. Kochar as intelligence officer was "the eyes and ears of the FDA", but he used his skills to suppress investigation and thwart it. The Commission found that Kochar was a past master at this art.

Then there is Tolia.

Tolia is *the tout.*

Associated with two companies – Tolson Drug Laboratories and Atul Pharmaceuticals, he was a habitual loiterer in the FDA. Earlier he used to pack zinc oxide without a licence but the FDA still loved him. In fact when proceedings were launched against him he got Dr Baliram Hiray, the health minister to reverse proceedings and the latter even stated before the Commission that it was done 'to serve public interest". Dr Sane who was the Commissioner of FDA was persuaded to take a lenient view. *Interestingly after Sane's retirement, Tolia provided him with office facilities. Sane started 'a consultancy business in the name of GMP Consultants, GMP standing with unintended irony for Good Management* Practice. He had his office in Tolia's office premises at TV industrial estate. GMP Consultants was merely a facade for Sane's activities as a liaison man with FDA where several of his erstwhile comrade in arms are'. Sane was a weak commissioner who obliged health ministers. He obliged minister Sarnayak by not prosecuting Sakarchand Shah for producing spurious Sulphadiazine tablets and also for with drawing charges against those adulterating groundnut oil.

Then there is Kulkarni, *the facilitator.*

As Joint Commissioner of the FDA, Kulkarni filed charges against Dolas for inefficiency, misconduct, negligence, and insubordination. On the basis of his report, an inquiry were framed. During the course of the inquiry Kulkarni retracted all his charges and Dolas was acquitted. For his achievement Kulkarni was transferred from Nagpur to Bombay as 'a just reward'.

On January 10, 1985, Emcure Pharmaceuticals made an application for additional products. The speed with which the application was processed was intriguing. The application reached the FDA office at Pune on January 14, 1985, the FDA inspected the premises on January 28, *1985, and on the same day the joi commissioner gave his recommendatio On January 29 the papers reached Bomba and N D Kulkarni processed the pape on the same day. Incidentally he retire* two days later and is now serving a consultant to Emcure Pharmaceuticals One could also add that during his caree Kulkarni also helped facilitate the dropping of charges against Cyma Pharma fo marketing substandard drugs, Hem Pharm for producing substandard chloramphenicol tablets, especially as its proprieto "a family friend of the FDA" provided free medical treatment to its officers.

The one meets *the certifier* Bhirud.

S D Bhirud was the first Joint Commissioner and Licensing authority of the FDA. He was the one who gave his imprimatur to all the machinations of Kochar, Dolas and Kulkarni. The Commission deemed that "Bhirud was a total misfit'. He took absolutely no interest in investigating the deaths at J J Hospital. He would blindly sign reports to the government which were tailor-made by Dolas. Bhirud was equally supine to the machinations of Kochar. The Commission noted that 'Bhirud was mortally afraid of Dolas and obediently signed those reports presented to him".

The periodic table of corruption can go on. Lentin classifies them zealously but one name dominates all becoming as the

Commission itself admits, the thread that ties together the narrative, Dolas.

For Lentin evil can not stand exposure; evil is something underground, damp, dark, tropic. Evil has to be confronted objectively and in public. He states "Secrecy breeds suspicion and suspicion breeds contempt". Yet Dolas is one person who threatens to evade Lentin. Behind the judge's apparent disgust is a sense that he has encountered a new species, that Dickens and Shakespeare might need Dostoevsky for a deeper understanding.

Lentin's literary metaphors from the world of Dickens and Shakespeare holds only at the first level. There is a realism, a moral resonance to his language. But Falstaff and Shylock mislead in the world of Kochar and Dolas. The theatres of the medieval world and those of the modern bureaucratic domain are different. Falstaff's attitude to his victim or Shylock's sense of resentment, even revenge, represents a passion of a different sort from the clerks of the FDA.

Dolas seems a blend of Machiavelli and Dale Carnegie, an instiller of fear, meticulous as a miniature. For Dolas, the FDA is only incidentally about medicine. He could easily have been in electricity, transport, real estate. All he needs are the skein of rules and procedures to weave his own special labyrinth. It is almost as if Dolas rewrote the computer programme of FDA to create as Lentin dubs it a world "where good was evil and top was down". Dolas is not a sadist driven by pathology, ideology or passion. All that motivates him is money and power. If he could have sold the funeral commodities to the 14 he would have done so and probably adulterated them also. There is no satiety to it. No target level. Not even a redundancy because each act of manipulation attains a different level.

Lentin considers Dolas' efforts at 'transfers and promotion'. Dolas is a manipulator, a survivor. Out of his 28 years service, he managed to serve 20 in Bombay and four in nearby Thane. His close proximity to power ensured his survival in Bombay. He always knew the right person to approach. He persuaded the Gandhian, Bhaskar Rao Chalukya to put in a word for him with the minister when a departmental enquiry was in progress. Of course he forgot to tell him that the charge was corruption. He approached Shalinitai Patil when her husband was Chief Minister. Dolas was relentless. He superseded four other officers to become joint commissioner. The joint commissioner is the only statutory licensing authority for the entire state. It was solely up to him to grant or refuse licences. It was he who approved of technical staff, layout etc.

During Dolas' term 852 drugs were found to be substandard and the Commission discovers that practically none of them had been prosecuted. It was Dolas who subverted the investigations into the deaths at J J Hospital. In fact in protecting Chem Med, Dolas even states before the Commission that "14 deaths was not really a serious business". Lentin pursues him relentlessly till he retracts the statement. Dolas could blithely claim he had no personal interests in the industry despite his daughter working for a well-known drug company. When Kulkarni filed charges against him for inefficiency, insubordination, indifference Dolas persuades him to retract it and rewards him with a choice transfer. When the forces of law virtually catch with him, Bhai Sawant, the minister transfers him from the department of drugs to food. In actual terms all it meant was moving from one room to another in the same building, "from one bedroom to another" where he could still keep an eye on his fieldom.

The Commission's final comments on Dolas, that 'officer of neuter conscience' are both fascinating and damning.

> Slight of build, soft of speech, initially unperturbed, S M Dolas radiated old-world courtesy; None of this however could disguise the deviation of his mind or his absurd and fanciful pretensions to rectitude. He believed not in force but in subtlety; and he believed he was subtle. That was his mistake. His conduct was as negligible towards the efficient and honest discharge of his duties as his tortuous mind was as Shylockian in its capacity for intrigue. Dolas wielded absolute power in the FDA. Absolute power corrupts absolutely and there is nothing by way of Dolas' activities in the FDA to doubt the authenticity of that axiom. With him in virtual control and Bhirud as his assiduous sycophant and compliant today, the whole order of the FDA corresponded with the rapacious capacity of its members and resulted in the ridiculous difference between their supposed aims and their actual achievements. To Dolas can be attributed the corruption of power reinforced by disdain of consequence, conceived in political patronage and his infinite capacity to use others for the fulfilment of his objectives. It is unfortunate for Bhirud and the FDA and the public at large, that he should have surrendered himself so totally to the disastrous influence of Jt Commr Dolas. If I conclude that in Dolas' moulding hands, Bhirud was a moral coward, Bhirud has only himself to blame for that deliberate revelation. Dolas left the witness-box a deflated man, of cringing manners, indifferent to truth as he was to his duties. It is difficult to see how a man so utterly lacking could even have been thought of to hold charge a post as sensitive as Licensing Authority even for short span of time and with a limited possibility of choice.

VII

Corruption to thrive needs the official imprimatur. The FDA was corrupt but it was a corruption sanctioned and sustained by a series of health ministers. In fact the best way to understand this officialdom of corruption is not to list out the sins of ministers but to understand what happens when an honest man enters the system. Fighting corruption is not easy. How does one reform the FDA?

Probably the one upright man in the upper echelons of FDA was Venkatachalam. He was brought from the IPS to the FDA. His target was Dolas and all he stood for. He said of Dolas that 'his subordinates were afraid of him and that his seniors were in his pocket'. The situation that Venkatachalam faced is described with rare candour in an interrogation before the Commission. Sipahimalani, owner of Chem Med was asked

Ques: Is it correct that in your kind of business you cannot afford to antagonise the FDA officers?

Ans: Yes, I would say that is correct.

Ques. Cancellation of licence or with awal of approval would be a closure of your business?

Ans. Yes

Ques: Is it therefore always better if the FDA officers are kept pleased?

Ans: Generally speaking, yes. One of the ways in keeping them pleased is not to challenge their order

Ques: Are there any other ways of keeping them pleased?

Ans: Yes. Generally speaking if you give them presents or something like that or be a very good host by inviting them to dinners or parties.

Ques: Is the discretion of the FDA officers in granting or revoking licences titled by the hospitality extended to them and the presents given to them?

Ans: That would depend upon the officer concerned.

Ques: By presents do you mean presents in cash or kind?

Ans: In cash and in kind.

Ques: Therefore the more munificent the present, the greater would be their goodwill?

Ans: That would be the general tendency (p 180).

The Commission noted that "This general tendency applies to all analytical laboratories, manufacturers and repackers who are dependent for the licences on the FDA. This answer applies to whosoever has to deal with FDA and other authorities in general".

What Venkatachalam began was a cleaning of the augean stables. He found over 900 applications for licences pending and set a time limit for their disposal. This was resented by FDA officers "for the longer the licences were kept pending, the greater would be the anxiety of manufacturers to strike a bargain with the officers. With one stroke Venkatachalam took away their pickings". Next he drove away the touts and power-brokers including Tolia from the FDA premises. This was resented even more by the officers for as the Commission noted that 'they would be thwarted in their misdeeds without the medium of the worthy gentleman through whom they could establish a monetary dialogue with unscrupulous manufacturers and licence holders'. Venkatachalam added insult to injury by launching prosecutions and reopening files which had been declared closed. One move in particular created great consternation and this was his reopening the file of "the family friend of FDA", Tolia. It was described in 'certain quarters as the unkindest cut of all'. The Commissioner also introduced the system of the maintenance of movement diaries, a hard blow to inspectors who now had to account for their work, movements, and quotas. The industry's response to all this was intriguing. When "Venkatachalam tried to take manufacturers into confidence with a view to know their difficulties" they were reticent. As Venkatachalam explained before the Commission "they said that I was merely a passing phase as Commissioner, whereas they would have to deal throughout with Dolas."

The Commission noted that 'the qualities of efficiency, integrity and independence' were 'the very qualities which in the topsey-turveydom of ministerial interference resulted in his downfall'. It was clear 'that successive ministers didn't want an upright man'. Even worse, 'the entire system, including power-brokers and touts, unscrupulous manufacturers and the FDA officers themselves were against Venkatachalam'. The Commission added that there was as usual "a health minister weak enough to succumb to pressure". Venkatachalam was "inconvenient to handle". What was also ironic was that he was replaced by V C Sane. The Commission noted "It must indeed be the Devil's Delight (to borrow a literary title) that an officer as corrupt ... as Sane should have replaced an upright and efficient officer like Venkatachalam at the helm of FDA". It adds: once Venkatachalam left "the ills which he curbed erupted once again. Those ills can best be compared to wild horses held in check on a tight rein and which go out of control once the rein is loosened. And so it was with FDA."

S M Dolas who had been transferred by Venkatachalam made "a triumphant return to Bombay". Tolia was rehabilitated in the FDA and the prosecution case against him was withdrawn. Maintenance of daily diaries was rendered a farce. The licensing authority succeeded in making a two-thousand crore industry dance to his tune and corruption increased by leaps and bounds'. As one partner in a medical firm put it 'to the FDA officers Diwali comes more than once a year'.

The Commission added that such corruption was made possible by health minister and noted "Health ministers cannot possibly discipline their subordinates, if they themselves commit flagrant breaches of rules and regulations and indulge in acts prompted by extraneous consideration. Corrupt masters make corrupt servants." The roll-call of 'masters' includes the following health ministers – Baliram Hiray, Bhai Sawant, master of transfers, patron of Dolas, Pramila Tople and G S Samayak.

Only a few addendums need be stated. A few loose ends.

The Commission notes that "in addition to the 14 who died, 34 patients who found their way to the nephrology department had been given glycerol Batch 27. They had not died in the hospital." The Commission asks "Are their whereabouts known? Is their condition known? Out of these how many are dead and how many crippled?" The Commission admits that it was not possible for it to trace them or enquire about their well-being. "That is for government to do and to offer them adequate compensation because for no fault of theirs, they were administered contaminated glycol in a government hospital."

In one of the last sections of the Report the Commission ends a discussion of the FDA with this quick sentence: "And thus ends the saga of Venkatachalam". It leaves it for the reader to add 'Dolas still rules'

Financial Crisis and Elusive Recovery

Lessons from South Korea and Thailand

C P Chandrasekhar
Jayati Ghosh

The current crisis in emerging markets may signify the end of a phase of international capitalism in which deregulation and increased economic integration have led to increased volatility and uncertainty. This article examines – with a focus on Thailand and South Korea – the factors that led to financial liberalisation, the link between financial openness and crisis and the problems that persistence with open regimes creates for efforts to overcome the crisis. The experience shows that developing countries will have to control and regulate capital flows in accordance with national priorities.

IT is now commonplace to date the current economic crisis in south-east Asia from July 1997, when the Thai baht was put on float and quickly depreciated against the US dollar. It is true that the financial contagion that followed led to collapsing currencies and slumping stock markets across the region, and that the real economic crisis appeared thereafter. But signs of impending problems were evident in several of these economies for some months before. In Thailand, for example, there had been speculative attacks on the currency from around August 1996, which were warded off only with great difficulty by the Thai government, and the balance of payments imbalances which triggered such speculative attacks were clear from early 1996 [Ghosh et al, 1996]. The first Thai company to miss payments on foreign debt defaulted as early as February 5. Similarly, in South Korea there were problems evident at least from January 1997, with several chaebols facing difficulties in servicing some of their loans.

Seen in this light, the sheer longevity of the crisis becomes a matter of note. It is more than two years since the first clear signs of crisis, and nearly one and a half years since the full-blown financial debacle. Yet, the south-east Asian region continues to be in the throes of a recession, if not a full-fledged depression, and the desperate search for some straws in the wind that would suggest any future recovery still remains largely fruitless. While the financial indicators that first brought about the crisis have now largely stabilised, the real economic slump is worse than ever. And finance remains the key to understanding both the nature of the crisis and the apparent inability to recover from it.

In this article, we examine the factors that led to financial liberalisation, the link between financial openness and crisis and the problems that the persistence with open regimes creates for efforts to overcome the crisis. In the discussion, we focus on two countries that have come to symbolise the crisis in its various forms, Thailand and South Korea.

Thailand was the first country to have experienced a major financial crisis, and started the downward spiral through contagion in the region. South Korea's economy is entirely different in its structure, macro-economic fundamentals and even in its degree of development, and yet its financial crisis has been remarkably similar. Both countries went speedily to the IMF for assistance, and subsequently both have been exceptionally 'well-behaved' in conforming to the IMF's policy guidelines. Nevertheless, in both countries there have been sharp and continued declines in output and economic activity, and the process of contraction continues even though the IMF has permitted a limited degree of reflation by repeatedly relaxing the budgetary targets it has set for them. Yet the superficial signs of stabilisation in terms of more stable currencies, slightly lower interest rates and less volatile stock markets, have been generated only through a contraction that squeezes large current account surpluses out of economies in severe crisis. The suggestion now is that the region is headed for a 'lost decade' similar to that experienced by Latin America in the 1980s, even though the economic processes involved are very different. This is especially ironic given the extent to which the east Asian region had been touted as the example for other developing countries, including those in Latin America and Africa [see Stein 1995 and Wade 1990, among others].

I
Financial Openness and Economic Instability

Why has recovery proved to be so elusive in the region, and particularly in these two countries? For an answer to that question we need first to look more closely at the nature of the crisis and the particular manner of its unfolding. With the spectre of a financial crisis now haunting Wall Street and the west, even mainstream international opinion, led by the World Bank, is seeing 'premature' financial liberalisation in developing countries, with inadequate supervisory and regulatory institutions as a proximate cause of the crisis. This, together with global capital market imperfections that resulted in surges of capital flow in periods of prosperity and waves of panic in periods when economic fundamentals weakened, are being seen as the factors that led to the east Asian crisis [for a detailed elaboration of this argument see World Bank 1998]. However, this tendency to adopt positions that sound similar to the more radical critiques of financial globalisation that were scoffed at until recently, is accompanied by a refusal to accept at least some of the systemic influences that led up to the crisis. In particular, it is being argued that financial liberalisation *per se* is acceptable so long as prudential norms and guidelines are in place; and that goods market liberalisation, which requires a vibrant export sector to finance a rising import bill, is unequivocally positive. To quote the World Bank: "The potential for all countries to gain from freer trade and from expanded flows of foreign direct investment remains as compelling and valid as ever, indeed continuing to increase with advances in transport and communications technologies. Developing countries

will continue, as in the first part of the 1990s, to see the payoffs of almost two decades of economic reform and structural adjustment." It is to ensure the realisation of those predicted payoffs that the Bank seeks to draw some lessons from recent experience, which diverge from those implicitly drawn by the IMF.

The IMF too has learnt its lessons. It has not only backed a call for "strengthening the international financial architecture", but also cautioned countries against hastening towards capital account convertibility, and chosen to put on hold its call for fiscal contraction in east Asia. The explanations for this superficial change in perspective are not hard to find. First, with the near-collapse of hedge funds like Long Term Capital Management (LTCM) in the US, it is increasingly becoming clear that 'lack of transparency' is not a problem typical of emerging markets but rather is a feature intrinsic to the liberalised and proliferating global financial system. The international banking system, in search of the high returns promised by risky investments, had lent such funds sums that were many multiples of their capital base, and helped fuel a speculative boom in both emerging markets and developed country stock markets. As the expectations on which such investments were made have been belied, there is a real threat of a collapse of the speculative bubble, and even of that collapse driving the developed industrial nations into a deep recession. Secondly, it has become clear that the restoration of at least a semblance of growth and stability in the Asian region, in the economies in transition and in Latin America is a prerequisite for stalling a global recession, which now is a real possibility. With the consequences of liberalised finance being felt closer to home, developed country governments and the international financial institutions have woken up to the fact that unregulated finance creates financial and real instability.

This reality has generated a degree of unprecedented candour even on the part of the IMF, which was hitherto instrumental in pushing for financial and capital account liberalisation in all the developing countries in which it had any policy influence. The IMF's *World Economic Outlook* declared: "It would be wrong ... to attribute financial crises exclusively to policy shortcomings in the crisis countries. Financial crises of the type experienced in Asia and Russia also illustrate the difficulties that emerging market countries can experience when they suddenly become the target for very large capital inflows. History is replete with episodes in which developing countries have experienced large-scale capital inflows in situations when rates of return in the industrial countries were relatively unattractive, for example during periods of cyclical economic weakness, or when developing countries have appeared to offer particularly promising investment opportunities... Complications often arise for two reasons. First, because of the magnitude of the resulting capital inflows relative to the absorptive capacity of the recipient countries, the inflows may contribute to surges in property and stock market prices as well as appreciating real exchange rates – asset price bubbles that often prove unsustainable. Second, when cyclical conditions normalise in creditor countries, or when perception of countries' fundamentals change, investors and banks may no longer find the higher returns in emerging market countries worth the risk. Bouts of excessive optimism among international investors followed by episodes of excessive pessimism can also be a problem as illustrated by the inadequate yield spreads on emerging market debt instruments immediately prior to the Mexican and Asian crises, and by the excessive jumps in risk premia in the wake of these crises, even for countries with relatively sound policy records. Indeed, such cycles go back hundreds of years. Through these channels, and in conjunction with weak financial systems in many emerging market countries, and other weaknesses in policies and institutions, fluctuations in the global economic and financial environment may therefore contribute to the proneness of emerging market countries to crises" [IMF 1998b:20-21].

It cannot be denied that excessive dependence on foreign capital inflows, especially short-term debt, is an important explanatory factor for the nature and the severity of the crisis in east Asia. But a fuller explanation must touch on a related set of issues: Why did these countries, with remarkably high domestic savings and investment rates, choose to invite foreign capital flows of this magnitude? And why did capital from the ostensibly more transparent and rule-based financial systems in the more developed financial markets choose to invest sums in these countries which we know, with hindsight, were far beyond their capacities to absorb?

Financial Centralisation and Volatility

To answer the second question first, we need to examine the manner in which finance capital rose to a position of dominance in the global economy and the role that cross-border flows of capital have been playing in the process of globalisation. Initially, there were specific developments outside the realm of finance itself that contributed to an increase in international liquidity, such as the surpluses generated by the oil shocks which were largely deposited with the international banking system. Subsequently, financial liberalisation increased this overhang (a) by increasing the flexibility of banking and financial institutions when creating credit and making investments, as well as permitting the proliferation of institutions like the hedge funds which unlike the banks were not subject to regulation; (b) by providing the space for 'financial innovation' or the creation of a range of new financial instruments or derivatives such as swaps, options and futures that were virtually autonomously created by the financial system; and (c) by increasing competition and whetting the appetite of banks to earn higher returns.

The massive increase in international liquidity that followed these developments found banks and non-bank financial institutions desperately searching for means to keep their capital moving. At first, there were consumer credit and housing finance booms in the developed industrial nations. But when those opportunities petered out, a number of developing countries were discovered as the 'emerging markets' in the global financial order. Capital in the form of debt and equity investments began to flow into these countries, especially those that were quick to liberalise rules relating to cross-border capital flows and regulations governing the conversion of domestic into foreign currency. Singh (1996) has documented the abnormally large reliance on outside finance for corporate investment in the more prominent newly industrialising countries, and offered some proximate explanations for this. The result of these developments was that there were a host of new financial assets from the emerging markets in the international financial system which were characterised by higher interest rates ostensibly because of the greater risks of investment in these areas.

There are a number of features characteristic of the global financial system which evolved in this manner. Principal among these is the growing importance of unregulated financial agents, such as the so-called hedge funds, in the system. Many years back the Group of 30 had cautioned governments that these funds were a source of concern because they were prone to "undercapitalisation, faulty systems, inadequate supervision and human error".

Though hedge funds first originated immediately after the second world war, they have grown in number and financial strength in recent times. Their number is currently placed at between 3,000 and 4,000 and they are estimated to be managing $300-400 billion of investors' money. These investors include major international banks, which are forced by rules and regulations to themselves avoid risky transactions promising high returns, but use the hedge funds as a front to undertake such transactions.

The operations of the now infamous LTCM illustrates one of the roles these institutions play. Operating out of the US, as most hedge funds do, LTCM managed a part of the money of leading banks, like Travelers Group and UBS of Switzerland. The fund's principal trading activity was based on exploiting the differentials in interest rates between different securities. It was to the credit of LTCM, it was argued, that it indulged in such trades by investing primarily in sovereign debts in emerging markets which were more secure, and yet garnered returns as high as 40 per cent on capital. What was less praiseworthy was the extent to which its operations were based on borrowed capital. On an equity base of a little less than $5 bn, LTCM had borrowed enough to undertake investments valued at $200 bn or more. This was possible because there was nothing in the regulatory mechanism which limited the exposure of these institutions relative to their capital base.

Such flows of credit to a few institutions are significant because in a world of globalised and liberalised finance, when countries are at different phases of the business cycle and characterised by differential interest rates, capital flows in the direction of high returns. Nothing illustrates this better than what the markets term the 'yen-carry trades'. According to the IMF capital markets report for 1997 [IMF 1997:98-99]: "Foreign purchases of US treasury and government agency bonds and notes reached $293.7 bn in 1996, and there was a further $78 bn of foreign purchases of US corporate bonds. Similarly strong capital inflows to US securities markets have been apparent in the first quarter of 1997: foreign purchases of government and corporate bonds during the first quarter of 1997 were slightly above the quarterly average during 1996.... Particularly wide interest differentials between the US and Japan, in conjunction with the belief that the Bank of Japan did not want the yen to strengthen in 1996–97, were viewed by some large global hedge funds as a potentially lucrative situation. These so-called yen-carry trades involved borrowing in yen, selling the yen for dollars, and investing the proceeds in relatively high-yielding US fixed-income securities. In hindsight, these trades turned out to be considerably more profitable than simply the interest differential, for the yen depreciated continuously over the two years from May 1995 through May 1997, which reduced the yen liability relative to the dollar investment that it financed." The implications of these and other flows to the US was that international liquidity "was intermediated in US financial markets and invested abroad through purchases of foreign securities by US investors ($108 bn) and by net lending abroad by US banks ($98 bn)" [IMF 1997:100].

There are a number of points to note here. To start with, the current global financial system is obviously characterised by a high degree of centralisation. With US financial institutions intermediating global capital flows, the investment decisions of a few individuals in a few institutions virtually determines the nature of the 'exposure' of the global financial system. Unfortunately, unregulated entities making huge profits on highly speculative investments are at the core of that system.

Further, once there are institutions that are free of the now-diluted regulatory system, even those that are more regulated are entangled in risky operations. They are entangled because they themselves have lent large sums in order to benefit from the large returns the risky investments undertaken on their behalf by these institutions seem to promise. They are also entangled because the securities on which these institutions bet in a speculative manner are also securities that these banks hold as 'safe investments'. If changes in the environment force these funds to dump some of their holdings to clear claims that are made on them, the prices of securities the banks directly hold tend to fall, affecting their assets position adversely. That is, there are two consequences of the new financial scenario: it is difficult to judge the actual volume and riskiness of the exposure of individual financial institutions; and within the financial world there is a complex web of entanglement with all firms mutually exposed, but each individual firm exposed to differing degrees to any particular financial entities.

Entanglement takes other forms as well. With financial firms betting on interest rate differentials and exchange rate changes at virtually the same time, debt, stock and currency markets are increasingly integrated. Crises, when they occur, do not remain in one of these markets but quickly spread to others, unless stalled by government intervention. Finally, the rise of finance in the manner described above feeds on itself in complex ways. The explanation for the liberalisation wave in the developing countries is that this pyramidal growth of finance, which increased the fragility of the system, was seen as an opportunity. Enhanced flows to developing countries, initially in the form of debt and subsequently in the form of debt and portfolio investments led to two consequences. First, the notion of external vulnerability which underlay the

Source: IMF (1998).

interventionist strategies of the 1950s and 1960s no longer seemed relevant – after all any current account deficit could be financed, it appeared, with capital inflows so long as such inflows are ensured. Second, growth was now easier to ensure without having to confront domestic vested interests, since international liquidity could be used not merely to finance current and capital expenditures but to ease any supply side constraints that may dampen or bring to a halt such growth.

The financial press, the international financial institutions and large sections of the academic community argued that this created an opportunity to launch on an integrationist growth strategy in the developing countries, since in any case the sums required there were seen as a small fraction of the international liquidity being created by the financial system. For western finance emerging markets were a hedge, and for developing countries international finance was an opportunity. A cosy relationship seemed easy to build. It appeared that all that was needed was the liberalisation of finance and a monetary policy that ensured interest rates high enough to make capital inflows attractive even after adjusting for risk.

II
East Asian Experience

In the case of east Asia, these arguments could be dismissed on the grounds that growth was hardly a problem. However, there is reason to believe that, despite their high savings rates, the decision to liberalise finance and allow free capital inflows was in part the result of a growing inability in these countries to sustain the export-based miracle growth rates that had made them the favourites of international capital. It is now almost universally accepted that in terms of the degree of openness and the extent of intervention by the state in the functioning of markets, the east Asian countries pursued widely varying strategies. However, the common element in those strategies was the crucial role of exports in sustaining their high growth rates. Unfortunately, successful export growth has its costs, especially when it is such rapid growth that it involves continuously increasing international market shares. It invites retaliatory action from countries which are the targets of that export drive, it leads to a loss of GSP preferences, it triggers a rise in domestic wages, it often results in infrastructural bottlenecks. All of this in fact happened, and it tended to undermine the very export competitiveness that underlay the high rates of growth in these countries.

Those who extolled the export-orientation in these countries and the associated 'flying geese' phenomenon which saw such a strategy replicated in new countries in the region, recognised this reality. But they also presumed that the early new industrialisers (NIEs) would, in response, successfully diversify into more technology-intensive, high-end sectors and sustain their export drive. This was partially true. But what also happened is that intra-regional investment flows created similar capacities as those which characterised the 'early east Asian industrialisers', in newer and more competitive locations. To the extent that this has resulted in competition within the Asian region among those seeking the same markets abroad for the same products, older suppliers have often lost out in the competitive battle that ensued.

Nothing illustrates this more than world trade in the 'office automation' and consumer electronics sectors. Most Asian countries have experienced deceleration or decline in their manufactured exports since the middle of 1995, and the causes for this sudden drop have still not been adequately explored. One factor most commonly cited is the saturation of developed country markets, particularly for the office automation and telecom equipment segment and the machinery and transport equipment category. In the case of most of these countries these accounted for an overwhelmingly large share of total exports. The slow-down of trade growth in these categories is therefore seen to have had a disproportionate effect on exports from these countries.

If we examine the relative shares of 11 product groups in total merchandise trade in 1996, we find that since 1985, these shares have varied little, with two exceptions: the share of mining products has declined from 22 to 11 per cent (due mainly to a decline in the value of trade in petroleum), while that of machinery and transport equipment has increased from 31 to 38.8 per cent. Two items of significance within the latter category were office machines and telecom equipment and automotive products, whose share of merchandise exports stood at 12.2 and 9.2 per cent, respectively, in 1996. Of these two, office automation and telecom equipment constituted a major export for developing Asia (excluding Australia, Japan and New Zealand), accounting for 26.3 per cent of their total merchandise trade in 1996. If the 1996 shares are compared with those for 1984, the share of office and telecommunications equipment in world merchandise trade nearly doubled over the 12 years, from 6.5 to just over 12 per cent. Thus, telecommunications and office equipment have made important contributions to world trade growth in recent years, with rates of export growth which were higher than the average for all commodities. It could therefore be argued that a slump in the market for those commodities would have affected Asian trade performance quite adversely, given the importance of those commodities in east Asia's export basket.

This argument carries weight for a number of reasons: (i) if we take the six principal items of consumer electronics, office equipment and telecommunications, the eight east Asian economies accounted for 46 per cent of developing country exports of these items and 9.5 per cent of world exports in 1990-91; (ii) these commodities accounted for a significant share (15.4 per cent) of merchandise exports from these eight countries; and (iii) since these were the most dynamic areas in world trade growth during the last decade and a half, east Asian success in exports in these areas would have allowed them to ride the boom in this segment while being insulated from the slump in others. This partly explains the divergence in the growth performance of these economies compared with the rest of the world. However, what is perhaps more crucial is that the saturation in the market for these items has set off a competitive struggle among economies in the region which because of intra-regional investment flows have specialised excessively in these areas. Winners in that battle like the Philippines or those which have not specialised in such products have been the gainers. The Philippines doubled its exports of office automation and telecom equipment in two years, from $5,047 million in 1994 to $10,056 mn in 1996. These items therefore came to account for almost half its merchandise exports in 1996. Such growth must have triggered a price war besides slowing export growth in other Asian

economies. On the other hand, China is a country in which none of these products, excepting radio broadcast receivers, featured in its list of principal exports. Its export dynamism is based on a number of traditional manufactured exports like textiles and clothing for example, which accounted for 25 per cent of its manufactured exports in 1996. That is, China's[i] trading strength lies in areas in which the leading east Asian traders have lost their competitiveness much earlier, forcing them to gradually vacate the markets for such exports.

Thus, the trade experience of the east Asian countries afflicted by the currency crisis has indeed been specific, inasmuch as it reflects a fall in export volume growth and unit values triggered by an excessive specialisation through relocation in areas where capacity growth has come to exceed market growth. It was to deal with these problems inherent in the strategies they were following that many of these countries chose to diversify out of manufacturing into services in general and financial services in particular. Both South Korea and Thailand shared ambitions of becoming the financial hub of the east, and seeing a sharp rise in the services component of their GDP. Financial liberalisation was therefore seen as the means to achieve this end, as well as meet pressures from the developed industrial nations to open up the financial sector as a quid pro quo for keeping open developed-country markets for manufactured exports from the east. As a result, during the early 1990s, almost all east Asian countries liberalised their financial sectors and allowed local corporations, banks, and non-bank financial institutions to freely access international capital markets with little commitment to earn the foreign exchange needed to service the costs of such access.

But that was not all. An appreciating real exchange rate encourages investment in non-tradable sectors, the most obvious being the property market. Given the differential in interest rates between domestic and international markets and the lack of any prudence on the part of international lenders and investors, local agents borrowed heavily abroad to directly or indirectly invest in the property and stock markets. The resulting boom generated the incomes to keep domestic demand and growth growing at relatively high rates. This soon resulted in signs of macroeconomic imbalance, not in the form of rising fiscal deficits financed by the government mint, but a current account deficit reflecting the consequences of debt-financed private profligacy. It was inevitable that this would soon result in a collapse of investor confidence. When that did occur, capital was pulled out and currencies depreciated, those with dollar commitments in the offing rushed into the market to purchase dollars early and cut their losses. The spiral continued, generating a liquidity crunch and a wave of bankruptcy [Chandrasekhar and Ghosh 1998 elaborate this argument]. This is something which is recognised by the IMF as well.

Despite such knowledge, there still appears to be no forgiveness on the part of the IMF, in terms of changing the core policies it prescribes for developing countries facing balance of payments difficulties. In particular, international policy-making circles still refuse to come to terms with the link between export dependence, financial openness and instability. Even though the IMF has belatedly diluted its basic remedy of high interest rates, cuts in government spending and other deflationary measures which have exacerbated the crisis, it appears to be anxious to ensure that the most obvious conclusion regarding the need to regulate capital flows is not drawn, and that other developing countries do not follow Malaysia in instituting some forms of currency control. Further, it fears that faced with inadequate capital flows, developing countries may be encouraged to partially insulate their economies, thereby creating a national space within which they could seek to spur growth with government spending. Thus, in the IMF's view, "in all countries, it is particularly important that the difficult external environment does not lead to defensive exchange rate and trade actions with negative international consequences or to market-closing measures" [IMF 1998a:4]. All this is seen as a prerequisite for restoring foreign investor confidence and wooing back the same foreign capital which had created all the problems in the first place.

There has been widespread criticism of the IMF's east Asia strategy, not only from the World Bank, but from independent analysts [Veneroso and Wade 1998; Bullard et al 1998] and even those who were earlier very bullish about all forms of economic openness and globalisation. Thus, in a recent article, Radelet and Sachs (1998:1) criticise mainstream assessments of the crisis by pointing out that just as Jawaharlal Nehru had once remarked that history is written by the victors, so "financial history, it seems, is written by the creditors". They admit that "the crisis was not the inevitable result of an Asian capitalist model, but rather, an accident of partial financial reforms that exposed these economies more directly to the instability of international financial markets" [Radelet and Sachs 1998:23]. The implication is that continued financial openness is inimical to recovery.

Despite its unpopularity, IMF continues to hold what is still in essence its earlier position. This reflects not only the structure of power within that organisation, but also the persistence of its beliefs regarding how current capitalism works. The IMF obviously believes that restoration of capital inflows is the only viable route to recovery in these countries, and that liberalisation aimed at facilitating such flows and macro-economic and financial policies aimed at attracting them form the only acceptable response to the crisis in these countries. Such beliefs are based on the premiss that investor confidence in a world of globalised finance is country-specific and that the 'fundamentals' that spur such confidence are not undermined by greater financial openness.

Nature of Investor Confidence

Consider the argument that investor confidence is country- or region-specific. It is now clear that the all-too-brief period when the financial markets of some developing countries and economies in transition were seen as the favoured destination of international investors, is over for the time being. The outlook for most emerging markets is muddy if not definitively negative. According to IMF projections, total net capital flows to all developing countries are likely to decline from last year's levels by more than $90 bn, or around 40 per cent. Table 1 gives more detailed estimates from the IMF for Asia, Latin America and east European economies in transition. As expected, Asia shows the most dramatic change, which is not simply a decline but a reversal to a substantial net outflow of more than $18 bn [IMF 1998c].

Data on gross private financial flows to emerging markets indicate that gross (or new) financing peaked in the second and third quarters of 1997, and that in the first half of 1998 it was running at about half of pre-crisis levels. Asia has accounted for most of the decline in gross flows since mid-1997, but flows to other regions have also been adversely affected. In August, gross financing virtually dried up, reflecting the turbulence in Russia and other emerging markets. As a result of all this, net private capital flows in 1998 as a whole have been estimated by the IMF to be a further $44 bn lower than in 1997, at around $87.6 bn. This is less than half the net inflow recorded in 1996.

A survey by a private agency, the Washington-based Institute for International Finance (1998), has come up with similar indicators of a likely decline in finance to emerging markets in the foreseeable future, though the estimates of the IIF of capital flows to emerging markets are far higher than the IMF's figures for developing countries (Table 2). The IIF's estimate of disaggregated flows is presented in Table 3. The IIF report highlights the following important features of capital flows to emerging markets:

(1) Net private capital flows to 29 major emerging market economies are projected to fall to a little below $160 bn in 1998 from $240 bn in 1997 and a peak of over $300 bn in 1996. This fall reflects both the direct impact of the financial crises in Russia and Asia and consequential effects transmitted through financial markets.

(2) Lending by private creditors is projected to fall to $42 bn in 1998 from $97 bn in 1997 and $180 bn in 1996. Net lending by commercial banks is projected at about zero this year as net repayments by Asian economies will offset positive lending to emerging market economies elsewhere.

(3) Secondary market spreads on emerging market bonds have widened very substantially after the Russian devaluation and unilateral moratorium in mid-August, although there has been some moderation very recently. The IIF believes that in many cases these spreads now substantially exceed levels that correspond to a realistic assessment of default probabilities in individual countries.

(4) New issuance of credit has virtually come to a halt as borrowers are generally unwilling to pay current spreads and investor appetite for risk has declined dramatically. Bond issues from emerging market economies reached $63 bn through September compared with $93 bn in the same period last year.

(5) If it is assumed that spreads on emerging market bonds and other borrowing will narrow and access to international capital markets will gradually be restored for creditworthy borrowers, then the IIF projects that net flows from private creditors will again reach about $40 bn in 1999. However, a substantial part of this lending will be involuntary (in the form of debt rescheduling rather than fresh loans), as some economies including Russia and Indonesia are expected to incur interest arrears.

(6) Direct equity investment has been relatively less affected by recent financial crises and at $106 bn is projected to account for over two-thirds of private capital flows this year. Portfolio equity flows, in contrast, are projected to fall to only $11 bn this year from $26 bn last year, as emerging equity markets have fallen steeply and inflows seen in the first half of this year have been partially reversed.

It is now generally accepted among observers of varying ideological and analytical persuasion, that this is not a tendency that will quickly reverse itself. Even the IMF, generally the last multilateral economic institution to accept any unpleasant reality, has conceded in its *World Economic Outlook* (1998) that there is a real risk that the recent panic may fail to subside for some time. This is likely to imply significant net outflows of foreign capital from many economies, as already witnessed in the Asian crisis countries and in Russia. The growing fear and insecurity among market participants, which is reflected in the large yield spreads seen recently, could become self-fulfiling and result in the prolonged disruption of international financial flows with severely depressing effects on economic activity as well as on world trade.

What is important to note here is that the crisis – in the specific form of dramatic reduction in net capital inflows – is currently attacking virtually all emerging markets, not simply those which have been identified as having specific domestic problems or which are perceived as particularly risky prospects. This is essentially a repetition of a historical pattern in international lending and portfolio investment which can be traced over more than a century, whereby problems of repayment or potential default in one recipient country have led to dramatic declines in all such inflows to all developing countries, rather than being confined to the individual transgressor. International lending to developing countries has always been characterised by such cycles, and sharp collapses in such flows consequent upon repayment problems of a small subgroup of debtors, are evident in the 1920s, 1930s, and of course in the external debt crisis of the 1980s [Kindleberger 1986]. The current talk of 'contagion' – as if it were a qualitatively new market phenomenon – misses this obvious historical point. It has typically been in the nature of private international capital to move in such a manner, and the current expansion of global finance has only accentuated such a tendency.

Liberalisation and Investor Confidence

The second difficulty with the IMF's revised perspective is its failure to see that the fundamentals which may become crucial for the sustenance of investor confidence can be undermined by liberalisation itself. Not surprisingly, when the crisis which was brewing for more than a year, first broke out with the devaluation of the Thai baht in July 1997, mainstream international opinion, influenced by the international financial institutions, argued that wrong domestic poli-

cies in these countries were responsible for the crisis. The thrust of the analysis underlying that opinion was the idea that private profligacy financed by a non-transparent, state-directed financial and banking system, had fuelled a speculative boom based on capital flows from abroad. This tendency was in turn attributed to irrational and corrupt collusion between the state and private capital in these countries. The boom itself was seen to involve unwarranted expansion of overgeared productive enterprises as well as speculative investments in the property and stock markets. When developments in international trade triggered a slow-down of growth in these economies and their 'fundamentals' ostensibly came up for scrutiny, it was inevitable according to this view that a collapse steered by a loss of investor confidence would ensue.

The real change in terms of analysis is that now the situation where countries become dependent on foreign finance, in excess of their absorptive capacity, is blamed not merely on governments and private agents in emerging markets but on the international financial players as well. And the conclusion that is drawn is not that countries should turn their backs on such finance and pursue a more insular strategy which discourages the use of foreign capital inflows, but that they should adopt more prudent macro-economic strategies and that they and international investors should strive for greater transparency in the financial sector to ensure that only the best users are in a position to access capital and that such users and the international investors are not denied what are seen as market determined profit opportunities.

In fact, one very common conclusion that has been constantly repeated since the start of the Asian crisis in mid-1997 is the importance of 'sound' macro-economic policies, once financial flows have been liberalised. It has been suggested that countries like Thailand, South Korea and Indonesia have faced such problems because they allowed their current account deficits to become too large, reflecting too great an excess of private domestic investment over private savings. This belated realisation is a change from the earlier obsession with government fiscal deficits as the only macro-economic imbalance worth caring about, but it still misses the basic point. This point is that, with completely unbridled capital flows, it is no longer possible for a country to control the amount of capital inflow or outflow, and both movements can create consequences which are undesirable. If, for example, a country is suddenly chosen as a preferred site for foreign portfolio investment, it can lead to huge inflows which in turn cause the currency to appreciate, thus encouraging investment in non-tradables rather than tradables, and altering domestic relative prices and therefore incentives. Simultaneously, unless the inflows of capital are simply (and wastefully) stored up in the form of accumulated foreign exchange reserves, they must necessarily be associated with current account deficits. The large current deficits in Thailand and elsewhere therefore were necessary by-products of the surge in capital inflow, and that was the basic macro-economic problem. This means that any country which does not exercise some sort of control or moderation over private capital inflows can be subject to very similar pressures. These then create the conditions for their own eventual reversal, when the current account deficits are suddenly perceived to be too large or unsustainable. In other words, what all this means is that once there are completely free capital flows and completely open access to external borrowing by private domestic agents, there can be no 'prudent' macro-economic policy; the overall domestic balances or imbalances will change according to the behaviour of capital flows, which will themselves respond to the economic dynamics that they have set into motion.

That is not all. When this dynamic results in a crisis following a collapse in capital flows, restoring growth within an open environment of the kind that the IMF insists on proves near impossible. This is because the structure of an open regime (which is also open financially) is such that growth comes to depend not on exports but investments in non-tradables, particularly certain services and in asset markets, financed with capital inflows. Reversing this dependence on non-tradables and services itself requires large investments, in order to restructure existing and create new internationally competitive capacities. However, the economic contraction or slow growth that follows the collapse in investor confidence makes it impossible to rebuild that confidence in adequate measure. One way in which the IMF has sought to deal with this problem is to relax its fiscal deficit targets in countries that accept its conditions about openness. However, since pump-priming the system within an open regime inevitably widens the current account deficit and necessitates capital inflows, there are limits to which even this strategy can be pursued, determined by the ability of the IMF to organise the necessary foreign capital. In the event, recovery in these economies proves elusive and they are stuck on a trajectory which worsens the burdens of adjustment heaped on the population, which is ravaged by unemployment and an erosion of real earnings.

Sustainable recovery in these countries requires a different strategy. It involves a turn away from the excessive openness resulting from the mad pursuit of easily accessed foreign capital. For a time, the sheer availability of such finance, at least for a minority of highly publicised emerging markets, had convinced developing countries that the problems of external vulnerability which had warranted the earlier import substituting industrial policies are no longer relevant. Now, however, there is greater realisation that these problems of external vulnerability have not gone away, and can be as vicious as ever. This has meant a revival in policy ideas that are based on some degree of insulation from the vagaries of international markets, particularly financial markets. While a full return to the earlier forms of import-substituting regime is obviously not advisable, the only way in which fiscal deficits can be used to trigger growth is if there exists an 'area of control' insulated from the debilitating consequences of the free flow of capital, goods and services. Unfortunately, while the IMF is willing to relax its fiscal deficit targets, it is still completely against control and regulation over trade, exchange rates and capital flows.

To corroborate these conclusions, we examine in what follows the post-crisis

adjustment experiences of South Korea and Thailand. The factors leading up to the crisis in these countries are essentially similar to those elaborated above, in that liberalisation of various markets played a role in creating the macro-economic conditions for crisis. However, we do not concentrate on these, which have been described elsewhere [Chandrasekhar and Ghosh 1998; Ho-Joon Chang 1998; Pasuk 1998; Lauridesen 1998] but on developments after the onset of the crisis in mid-1997. Thailand illustrates an instance where the pursuit of IMF-style policies has not managed to restore investor confidence, with devastating effects on the economy and especially on the poor. The South Korean case indicates that even such a restoration of investor confidence need not be enough to generate an adjustment leading to economic recovery.

III
IMF and Economic Depression in Thailand

Recently, Jayasankar Shivakumar, the World Bank's director for Thailand, declared that "ten years will pass before the structural reforms take effect and prosperity can be measured for the vast majority of people". IMF and World Bank officials have never been known either for their sensitivity or for their eagerness to avoid the devastating effects their so-called 'reforms' have on the majority of the people in countries that follow their advice. Even so, this quotation is remarkable for the casual manner in which a medium-term prospect of continued economic disaster is prophesied for Thailand. It is even more remarkable given the alacrity and humility with which the Thai government has in general accepted the economic policy advice of the IMF and the World Bank in its attempt to counter its current crisis. Clearly, if the Thai people must continue to suffer for the next decade, the blame for this must also lie with these policy advisers, who have been closely associated with the strategies which are causing such suffering.

As late as November 1996, when it was already apparent to discerning observers that the Thai economy was heading for difficulties, Michel Camdessus, managing director of the International Monetary Fund, publicly upheld Thailand as a model of macro-economic policy for other developing countries. In August 1997, after signing the first of a recent series of letters of intent with the Thai government, he once again approved of the government's proposed policies to deal with the current crisis, which he felt would "decisively contribute to stability in financial markets in Asia". Since then, Fund officials have continued to insist that the policy package advocated by the IMF is the only possible way to deal with the crisis, and have also accepted that the Thai government has in general followed their recommendations without demur.

Yet in the period from August 1997, the IMF has been through no less than six 'letters of intent' with the Thai government, as continuously deteriorating economic circumstances render the earlier agreements irrelevant. For most disinterested observers, it is now clear that the IMF policies have contributed significantly to the deterioration : rather than helping to form the solution, the IMF has definitely been a major part of the problem. The IMF approach was initially based on two broad planks of fiscal compression and tight monetary control, both of which added to recessionary tendencies in an economy whose basic initial problem in the current crisis was asset deflation. This real economy recession, along with constrained access to credit, has in turn meant that Thai companies have faced greater difficulties in repaying loans, which has made the banks worse off, further adding to the financial sector problems. The continuing interaction between these downward pressures has led to the economic depression which is now sweeping across Thailand.

The explicit aim of IMF's strategy in Thailand, as elsewhere, is to restore foreign investor confidence, in the hope that a renewed inflow of foreign capital will allow economic growth to resume. To this end (and also as part of the overall dogma of reducing the role of government) it has proposed extensive privatisation of public assets, with the sales open to foreigners, as well as greater openness to foreign investment and ownership in areas such as real estate. Measures such as an expansionary fiscal strategy to counter recession, to be financed by raising taxes, are explicitly ruled out. So the only hope of recovery must rest with foreign investors who have to be enticed to come back into Thailand with large net inflows through whatever means possible. It is interesting that this revival of foreign investor confidence was hoped for in an economic context in which even domestic investor expectations are bearish in the extreme, with domestic markets shrinking and costs rising because of rising import costs and tighter credit.

It is not surprising that such a strategy has failed, nor that it has been associated with worsening economic conditions such that output targets have had to be continually revised downwards. The recession, which has now really become a full-scale depression, has also meant that the fiscal targets set by the IMF cannot be met despite the Thai government's ruthless cuts in a whole range of necessary development and welfare expenditure.

Thailand's record of fiscal surpluses came to an abrupt halt in 1997 when the government announced a deficit of 31.15 bn baht – the first such deficit in 10 years. For 1998, the government had originally promised to the IMF a budget surplus of 1 per cent of gross domestic product, or about 50 bn baht, for fiscal 1998, ending in September. This was supposedly to offset the interest costs on debt incurred through the Bank of Thailand's efforts to prop up failing financial institutions. To meet the target, the government slashed more than 200 bn baht from the fiscal budget through five rounds of cuts. Value added tax was increased from 7 per cent to 10 per cent while petrol tax jumped one baht a litre. Excise taxes on imported luxury goods such as wine and clothing also increased.

The economic contraction in the first half of 1998 forced the government to reconsider this fiscal strategy. Tax revenues were sharply down (except for value-

added tax receipts), as the depreciation of the baht significantly increased the foreign exchange losses of the corporate sector and domestic recession also kept profits low. Maintaining the 1 per cent budget surplus became next to impossible. The third letter of intent with the IMF, signed in February, conceded this. Instead of a 1 per cent of GDP surplus, the Thai government was allowed to run a deficit of up to 1.5 per cent of GDP for the central budget and 0.5 per cent for state enterprises.

But even the new targets proved unreachable, as the economic recession continued to wreck havoc on tax collections in the first quarter. A new revision was necessary by May when the fourth letter of intent was drafted. In this, the overall public sector deficit target under the programme for 1997-98 was changed from 2 per cent of GDP to 3 per cent, with some 50 bn baht to be allocated for strengthening the social safety net and ongoing public works projects. The fiscal target for the next year was also changed from balanced budget to a small deficit of 1 per cent of GDP.

The next quarterly review, known as the fifth letter of intent, which came in August, once more revised the fiscal targets. Under the agreement, the 1999 budget, which began in October 1998, was to have a deficit target of 3 per cent of gross domestic product, the same as the 1998 budget. This included a central budget deficit of 1 per cent of GDP, with the remainder from state enterprises. It excluded the 1.5 per cent of GDP budgeted for financial restructuring costs, including domestic bond issues by the Financial Institutions Development Fund and other costs from the reform package announced on August 14. Monetary policies were to be maintained, especially since short-term rates in the money market had fallen from 20 per cent earlier in the year to about 10-12 per cent. However, short-term interest rates, it was argued, should be "promptly raised to counteract speculative pressures". The government's priorities were to be corporate debt restructuring and financial reform measures. Both were seen as "essential to re-establish normal market relations, allow the resumption of credit flows, and support a recovery of the private sector".

The most recent quarterly review, or the sixth letter of intent dated December 1, 1998, goes even further. The overall public sector deficit for 1998-99 is now targeted at about 5 per cent of GDP, higher than the previous target by about 2 per cent of GDP. In addition, the interest costs of financial restructuring are estimated at 3 per cent of GDP of which, as indicated in our memorandum on economic policies (MEP) of August 25, 1998, the government will 'fiscalise' up to 1.5 per cent of GDP of interest costs in 1998-99.

The latest review thus suggests that while the IMF may have learned something from the debacle so far, it is nowhere near enough for it to provide a viable way out of the crisis. In allowing the government to run a modest deficit, the IMF has acknowledged that public spending may be one of the few ways to stimulate the economy, given the shortage of private capital available for productive investment and expansion. In fact, in an IMF release managing director Michel Camdessus "welcomed the easing of fiscal policy, and the strengthening of the social safety net", because "these factors, along with the significant interest rate reductions that have taken place in recent months, will provide a strong foundation for economic growth next year." However, the agreement lacks sufficient measures to help spur the economy and ease unemployment. To start with, it fails to recognise that the growth-inducing consequences of higher deficits would be limited for two reasons: first, higher deficits do not reflect higher spending, but a fall in tax revenues far greater than in spending; and second, the new demands generated by enhanced spending could well spill over in the form of higher imports rather than higher domestic production. Further, the package focuses additional spending on corporate and financial restructuring rather than on the expansion of employment opportunities. Thai critics have already argued that this will basically waste hundreds of bns attempting to bail out now-defunct finance companies whose major shareholders have long since cashed out and headed into comfortable exile abroad.

The resources for this bail-out of the private corporate sector are to come from a massive privatisation programme, in telecommunications, mains water and transport, which the Thai cabinet approved in late August. It is hoped that market liberalisation, including changes to land ownership and the Alien Business Law, would lead to greater foreign investment. Unfortunately there is yet no great interest in such investments on the part of foreigners. It is evident that this latest letter of intent essentially restates the same policy package that has already clearly failed, albeit with a few changes in the details of the fiscal deficit. It does nothing to increase domestic consumption and employment opportunities, which is the key to the economic turnaround. And it sacrifices more resources to the altar of investor confidence, offering both taxpayers' money and public assets for sale towards this dubious end.

Thai Growth Record

The failure of the package comes through from an examination of its effect on output, employment and general living standards. As evident from Table 4, the very high rates of growth that marked the 1980s in Thailand also continued into much of this decade. The early years of the 1990s in fact saw aggregate real GDP grow at around 15 per cent per annum, which came down to the still high rates of around 11 per cent in the middle of the decade. Given the volatility of agricultural growth, most of this increase came from industry and services. But by 1996, a deceleration was apparent, and this slow-down reflected both the deceleration in exports (which fell to zero growth in that year) as well as the saturation of domestic demand consequent upon a feverish speculative boom in real estate and financial assets. The crisis has been seen as primarily financial in nature, but of course it was closely related to real economic imbalances which were partly a creation of the financial spurt and in turn contributed to it.

Like several other developing country regimes in the early 1990s, the Thai government harboured ambitions of cashing in on the globalisation of finance by attracting large amounts of capital inflow. Indeed, the central bank in 1993 announced

its plan to develop Bangkok as a regional financial centre, taking advantage of Thailand's central location in south-east Asia and the apparent trend of continuously rising exports. Foreign exchange controls were relaxed in the early 1990s to encourage freer flow of capital. In 1993, the central bank allowed the establishment of International Banking Facilities to help mobilise offshore funds for domestic lending. These measures generated a heavy influx of foreign capital, the majority in the form of short-term credit seeking to exploit the higher interest rates available in the local market. Portfolio investments also increased as share prices on the Stock Exchange of Thailand jumped.

Meanwhile, however, the basket peg system introduced in the mid-1980s, which effectively fixed the baht to the US dollar, was continued. At one level, this was of course a basic requirement for the aim of becoming a regional financial centre and retaining foreign investor confidence. But the combination of this rigid exchange rate regime and liberalised capital flows inevitably set the stage for greater macroeconomic instability in the future. It should be remembered that a flexible exchange rate regime would not have got around this problem, since the high rate of capital inflows would, if anything, have made the baht appreciate even faster in real terms. The source of the problem in Thailand was actually in the very feature that was being lauded by international finance and the Bretton Woods institutions at that time. Essentially it was the sudden and dramatic increase in capital inflows that can be described as the original sin that created the future macro-economic imbalances. In the first place, the relatively high baht made exports less competitive, and also encouraged a boom in imports. This was also possible because the trade regime had been progressively liberalised by that point. Growing consumerism spurred heavy import demands, paid for in turn by capital inflows. Associated with this there was a shift in domestic investment away from tradables into non-tradables, and especially into real estate and similar sectors. Unproductive investments in property and speculative securities also led to higher costs, wages and capital goods prices, further undermining the competitiveness of Thai exports.

All this also encouraged greater dependence on foreign capital than was necessary or even warranted by the domestic investment pattern. Thai companies, seeing no exchange risks under the currency peg, flocked to international markets to borrow at interest rates lower than those prevailing in the local market, despite increasing leverage ratios. Financial institutions were also beneficiaries of relatively cheap foreign funds. As the economic expansion continued, lending criteria eased as banks and finance companies competed for increasingly risky investment opportunities.

As a result, the current account deficit reached a peak of 8.2 per cent of gross domestic product in 1995. The ratio of foreign debt to gross national product reached 50.14 per cent in 1996, pointing to the country's deteriorating external position. It is wrong to attribute this solely to the fixed exchange rate, however, as the Nukul Commission appointed by the Thai government has suggested. In fact, it is really the continuous and growing dependence on large capital inflows which was responsible, since this would have led to a high level of the baht even in a floating rate regime.

The floatation and associated devaluation of the baht on July 2, 1997 was the culmination of a period during which it had become increasingly difficult for the Bank of Thailand to defend the currency in the face of speculative attacks. But it triggered a major financial and then economic crisis into which the country has sunk even deeper in the subsequent year. Output has slumped, and there have been major losses in employment. The domestic credit system has nearly collapsed, and this has magnified falls in sales, trade and working capital. In the current year, an 8 per cent contraction is estimated. The economy recorded negative growth of 8.2 per cent of GDP in the first quarter, 9.4 per cent in the second and 5.8 per cent in the third. Already, the economic crisis has wiped out productive gains of the last seven years. For 1998, aggregate personal disposable income is estimated to be around 113 trillion baht, equal to that in 1991, and a stark contrast to the 183 trillion in 1996.

Meanwhile, the devaluation of the baht has done less than expected to boost exports, as evident from Table 5. Government forecasts show export revenue in dollar terms dropping by around 3 per cent, with total revenue of about $53 bn. According to the Bank of Thailand, June exports fell by 3.1 per cent in dollar terms compared with the year before, but shipment volume rose by about 15 per cent. Subsequently, the month-to-month rate of decline of the dollar value of exports increased sharply to 3.8 per cent in July, 11.7 per cent in August, 10.3 per cent in September, and an estimated 12.5 per cent in October. Private estimates suggest that the value of exports this year will be worse than expected, and that revenue in dollar terms is likely to fall by 8 per cent from last year's level. Agricultural exports should have benefited greatly from the baht depreciation, but to date they have not. The export value of agricultural products, which account for 13.8 per cent of all exports, rose by just 0.1 per cent to $1.9 bn in the first three months of the year. Industrial goods, which account for 65.3 per cent of exports, fell by 5.1 per cent to $8.8 bn, while agro-processing exports dropped by 14.1 per cent to $1.2 bn.

Along with the credit squeeze which has affected working capital costs for exporters, the inability of exporters to take advantage of baht depreciation has been attributed to a lack of bank financing, weak Japanese import demand, and a sharp economic contraction in Asia. The situation could worsen in the second half as raw material inventories in warehouses run out, if no fresh funds for replenishing stocks can be found. The result could be the closing of many small and medium-sized operations, and many more job losses, especially in the textile and garment industries.

The current account, which has shown steady surpluses for almost a year, reflects the collapse in imports rather than any real pickup in exports. The value of imports in the first 10 months of the year declined by almost 40 per cent compared with the same period last year. This is reflected in the trade balance figures, shown in Table 6. The result is a healthy looking current account, but a closer look reveals a sharp drop in imported raw materials for key industries such as textiles, automobiles, electronics and electrical appliances. Production for the domestic market is fraught with difficulty. Some firms are being squeezed by a lack of credit and falling cash-flows, while others have seen their markets vanish, or are making products that sell only at low prices that drastically reduce profit margins.

Official figures place unemployment at 1.8 mn people, but some analysts predict this could jump to three million next year

and corporate bankruptcies and downsizing continue. The greatest job losses have been in the industrial sector, but several services activities are also increasingly under threat as the downslide goes on. Already in the first half of 1998, both the number of firms reporting job losses and the number of employees who have lost their jobs project a big increase over last year's already large totals.

Meanwhile, economic conditions initially worsened even for those who still have employment. Food prices rose sharply as the baht devaluation had made rice exports more profitable. While the country remains more than self-sufficient in rice and peasants can probably maintain their rice consumption, those employed outside agriculture found food prices moving up disproportionately fast. However, the depth of the recession has helped steady prices. The overall rate of inflation, shown in Table 7, rose to touch double figures during the first half of the year, but has declined substantially since then. The economy seems to be entering a classic deflationary path.

Ironically, these deflationary tendencies have been further reinforced by the tight monetary policy imposed as part of the IMF package. The private sector, which was already strained from higher costs and declining revenues, has been further burdened by the lack of new credit and the onerous burden of debt service costs. In March, the central bank unveiled new loan classification, provisioning and accounting standards aimed at strengthening local financial institutions to international levels. Small and medium-sized banks came under fierce liquidity pressure in the first quarter of the year as deposits moved to larger institutions and foreign banks and interbank credit lines were cut. Local banks have seen asset quality decline further because of high interest rates and recession. In consequence, Thailand's commercial banks showed total losses of 113 bn baht in the first half of this year. The figure for non-performing loans, which continue to pose a major threat to the economy, is now estimated to be 1.7 trillion baht. In such a context, good debtors might well decide to keep the cash for fear that financial institutions would not lend again and that would cause non-performing loans to grow further. Few, if any, commercial banks are expected to show profit in 1998.

Since the recession is expected to stretch well into 1999, prospects for the banking sector in the medium term remain bleak. The sheer scope of the bad-loan problem, coupled with poor market sentiment, high interest rates and tight liquidity, have left many banks and finance houses seriously undercapitalised and facing insolvency. Bankruptcies and unemployment are expected to skyrocket, particularly with the passage of a new foreclosure law in October giving creditors greater leeway to seize collateral from delinquent borrowers. And the battered shape of the financial sector, with non-performing loans currently expected to peak at around 40 per cent of total outstanding credit sometime next year, will continue to act as a drag on sentiment amid market uncertainties of whether further bank and finance company closures are imminent. The result is a self-reinforcing downward spiral, which will continue unless active policy measures are put into place to reverse it.

All this has forced several small and medium-sized banks to turn to the central bank's Financial Institutions Development Fund for support. But this institution simply does not have enough funds given the enormity of the task at hand. In its financial reforms announced on August 14, the government pledged support for undercapitalised local banks and finance companies. Under the restructuring plan, the government will provide 300 bn baht in capital assistance for banks and finance companies. Incentives are in place to encourage speedy debt restructuring and new lending to the private sector. Bankers worry that this will lead to even more voluntary defaults by clients under the misguided impression that the state will pay for any losses. Other groups, such as the farmers, have been asking why so much public money should go to protect large firms and big banks, and have demanded a moratorium on their own debts.

In such a weak domestic economic situation, the external sector is unlikely to appear very strong. Even so, there appeared to be some recovery towards the beginning of 1998. The balance of payments, negative in January and February, moved into surplus in March and April. Portfolio investments and the successful recapitalisation of Bangkok Bank and Thai Farmers Bank helped cause a net capital inflow for the two months. But there are signs that the stability of the baht would be short-lived. By June, the baht crashed through 42 to the dollar, pulled downwards alongside other regional currencies by the weakness of the Japanese yen. There are increasing signs in the market that foreign speculators may gear up for another assault on the baht, and certainly speculative pressures on the currency are likely to remain significant in the medium-term unless some form of capital control is imposed.

Thailand's experience is one which suggests that pursuit of IMF-style macroeconomic policies does not spur investor confidence and trigger a recovery. Further, persisting recession makes it impossible to meet the IMF's fiscal targets, so that pursuing the strategy recommended itself becomes impossible. The result of course is a decline without any immediate prospect of recovery, the burden of which also falls on the poor and the fixed income earners who had no role to play in the debt-financed profligacy that triggered the crisis.

IV
South Korean Experience

The Thai experience has been interpreted by the IMF and other financial market analysts as suggesting that the recovery is elusive in east Asia because foreign investors are refusing to return. The South Korean experience contradicts that conclusion. It has been more than a year since South Korea's banks were subjected to the first credit-rating downgrade, because of their exposure to conglomerates going through an unprecedented financial crunch. And the country which epitomised east Asia's 'rags-to-riches' story has been a year from the date on which it accepted a loan from and subjected itself to conditionalities specified by the IMF. In the interim, South Korea has not just seen a change in government, but also a series of new initiatives worked out in consultation with, and monitored by, the Fund. As a result, the country has won itself credibility with the IMF. However, this has been inadequate to reach on the principal goal: that of spurring growth. On July 24, the government of Korea in one more letter of intent to the IMF declared: "The domestic economy...appears to be falling further into recession and consumer and investor confidence is at a low ebb. Unemployment has increased faster than previously expected and more layoffs are expected to result from the acceleration of restructuring."

The story of this decelerating growth is reflected in Table 8. GDP growth which had slowed marginally from around 8 per cent during 1994-96 to 6 per cent per annum over the first three quarters of 1997, fell sharply to 3.9 per cent at the height of the crisis during the last quarter of 1997, when negotiations with both the IMF for the $57 bn rescue package and the banks for the roll over of short-term credits placed at close to $100 bn were successfully concluded. But after these agreements were concluded, the process of deceleration in growth was transformed

into one of contraction, with GDP falling by close to 4 per cent in the first quarter of 1998 (relative to the corresponding quarter of the previous year) and by a massive 6.8 per cent during the second and third quarters. Almost all of this contraction in growth is attributable to three sectors: construction, manufacturing and services in that order. Needless to say, once the weight of each of these sectors in GDP is taken account of, the sector leading the economy into a slump is manufacturing.

The proximate explanations for the dramatic downturn in manufacturing are not hard to find. Since the South Korean economy is characterised by a high export-to-GDP ratio, the slow-down in export growth resulting from the regional crisis should itself have contributed to slower manufacturing growth. The dollar value of exports, which fell sharply in January, recovered only marginally thereafter and has stagnated at that level since (Table 9). But there have been two other important trends underlying the recession (Table 8). First, a collapse in investment reflected in a contraction in gross capital formation which in absolute magnitude fell by 10 per cent in the last quarter of 1997, 23 per cent in the first quarter of 1998 and by close to 30 per cent in the second and third quarters of 1998. Second, a downturn in private final consumption expenditure, resulting from the increase in unemployment and the erosion of money incomes accompanying the recession. The official unemployment rate, which averaged around 2.6 per cent through 1997, rose to 4.7 per cent during the first quarter of 1998 and is estimated at 7.1 per cent for October 1998.

This collapse of domestic demand called for a reflationary strategy, especially since the Korean crisis of 1997 was more the result of bank overexposure in corporations taking a beating in international and domestic markets. The IMF itself noted after concluding Article IV consultations in May: "In 1994-96, Korean conglomerates undertook an aggressive investment drive financed by large increases in borrowing from domestic banks, which, in turn, sharply increased short-term external borrowing. During 1997, an unprecedented number of highly leveraged conglomerates went into bankruptcy as the build-up in capacity proved unviable owing to the depreciation of the yen, a sharply adverse movement in Korea's terms of trade, and the slowing of domestic demand in 1996. The bankruptcies resulted in a severe deterioration in the balance sheets of Korean financial institutions." All of this was attributed to hasty capital account liberalisation during 1993-96, which substantially eased controls on short-term borrowing. While this called for a combination of capital controls and a restructuring of the financial sector, some effort to stimulate demand was necessary in the interim. The principal error of the strategy worked out by the IMF for South Korea was that it equated the difficulties generated by public profligacy with those stemming from private profligacy encouraged by financial sector liberalisation. So it recommended to South Korea what it imposes on countries where balance of payments difficulties result from excess public deficits financed directly or indirectly by borrowing from abroad, viz, deflation led by a sharp curtailment of public expenditure.

This engineered deflation was to take two forms. First, a tight money policy designed to push up interest rates. As the South Korean government's first letter of intent to the IMF stated, "to demonstrate to markets the government's resolve to confront the present crisis, monetary policy will be tightened immediately to restore and sustain calm in the markets and contain the inflationary impact of the recent 'won' depreciation. In line with this policy, the large liquidity injection in recent weeks will be reversed, and money market rates will be allowed to rise sufficiently and will be maintained at that level or higher as needed to stabilise markets." Through this policy the call rate was raised from 12.5 per cent on December 1, 1997 to 21 per cent on December 5 and 30 per cent by December 24. Needless to say, this signalled a rise in all interest rates with the aim of halting speculative trading in the 'won' and of attracting foreign investors back into the market so as to strengthen the currency. For South Korean firms, overgeared due to past government encouragement and adversely affected by demand conditions, this increase in the interest burden was a prescription for bankruptcy. The understanding was that an essential prerequisite to deal with the financial crisis was a restoration of capital inflows and that some bankruptcies of Korean corporations was a small cost to be paid in pursuit of that goal. In fact, through capital market liberalisation and the substantial liberalisation of restrictions on the aggregate holding by foreigners of equity in domestic corporation, bankruptcies were sought to be converted into a benefit by encouraging sales of assets to foreigners at bargain prices that would contribute to capital inflows.

The second means of engineering deflation was fiscal contraction ensured through a surplus on the government's budget. When the IMF programme was initially adopted in December 1997, the IMF had demanded a package of tax and expenditure measures, designed to yield revenues equal to 1 per cent of GDP, which was expected to deliver a fiscal surplus (of 0.25 per cent of GDP) in 1998. Despite this, growth in 1998 was expected to remain positive at around 1 per cent, revised down from expectations of 2 per cent or more earlier. However, by February even the IMF had to accept that a weaker growth outlook for 1998 and the impact of the exchange rate depreciation would make a fiscal deficit of around 1.5 per cent of GDP inevitable. In the updated memorandum on the economic programme prepared for the second quarterly review in May 1998, it was decided that "with the updated macro-economic projections indicating weaker growth, and ongoing structural adjustment in the economy, a larger fiscal deficit (1.75 per cent of GDP) will be permitted". But barely two months later in July a new economic memorandum declared: "In order to support economic activity and to further strengthen the social safety net, the supplementary budget to be passed in August increases the deficit in 1998 to 4 per cent of GDP". The latest letter of intent dated November 13, 1998 states clearly: "The government is attempting to stem further economic contraction through a combination of stimulative fiscal policy and accommodating monetary policy. The national assembly approved the supplementary budget in September to allow the fiscal deficit to expand to around 5 per cent of GDP in 1998. The draft budget for 1999 also incorporates a fiscal deficit of 5 per cent of GDP with public investment spending to be concentrated in the first half of the year. The actual application of planned spending is being monitored on a weekly basis to make sure that fiscal stimulus takes effect in a timely manner. Monetary policy has also been eased. Call rates have declined well below pre-crisis levels, although lending rates have declined less rapidly." But these adjustments of the 'permitted deficit' have turned out to be too little too late, and have failed to prevent the virtual collapse of GDP.

The reasons for this continuous flexibility with regard to the fiscal deficit and monetary policy are not hard to find. When the IMF programme began in early December 1997, the projection was that as compared with growth in GDP of around 5.5 per cent recorded in 1997, the growth in 1998 would be around 3 per cent. To quote the first letter of intent: "The

programme is intended to narrow the external current account deficit to below 1 per cent of GDP in 1998 and 1999, contain inflation at or below 5 per cent, and – hoping for an early return of confidence – limit the deceleration in real GDP growth to about 3 per cent in 1998, followed by a recovery toward potential in 1999." By February the GDP growth projection was placed at a positive 1 per cent, although zero or negative growth was seen as a possibility. By May the letter of intent projected real GDP growth at minus 1 per cent, while admitting that "more negative growth remains possible". Soon thereafter on July 24 the projection was changed to the objective of "containing the decline in real GDP to 4 per cent, with recovery starting in 1999". The memorandum of economic policies prepared for the IMF in November 1998 remains silent on growth in 1998 and includes in its macro-economic projections for 1999 the expectation of "positive growth resuming during the year; the timing and strength of recovery will depend critically on improvements in domestic confidence and the external environment". Very clearly the notion that larger deficits and the "early return of confidence" would trigger a recovery has not been realised. Deficits do not work because the economy remains open and their effects do not remain in the domestic economy.

Nor does restored investor confidence seem to matter. According to the IMF's executive board's assessment made in May this year, substantial progress has been made in overcoming the financial crisis. To start with, after continuous depreciation till March, the 'won' appreciated slightly and stabilised. In November the currency stands at around 1,250 to the dollar as compared with 1,620 to the dollar in February and 1,378 in March. Second, inflation is close to zero on a month-on-month basis since March and the annualised rate at 7 per cent in August is well below the 9 per cent target set in July and is heading towards the original 5 per cent target of December 1997 Third, after the debt restructuring agreement with foreign banks reached in early April, which converted private short-term debt into government guaranteed long-term debt, albeit at a high interest rate, the South Korean government has successfully managed a $4 bn bond issue. This compares with Malaysia's decision in late July to postpone a $2 bn Eurobond issue because of poor market conditions. Fourth, as a result of the contraction in economic activity imports of all categories of goods have virtually collapsed in the last quarter of 1997 and the first quarter of 1998, so that even with exports performing poorly, the current account has been in surplus since November 1997, with the surplus averaging close to $3.8 bn a month since February. Fifth, according to the IMF's assessment there has been a significant increase in portfolio inflows. Sixth, bargain hunting by international corporations seeking to pick up assets of beleaguered South Korean firms has resulted in large inflows of capital in recent months. According to IFR Securities Data, non-Asian buyers spent $6.52 bn in the second quarter of 1998 on deals in Japan, South Korea, Hong Kong, Malaysia, Thailand and Indonesia. This furthers an upward trend since the third quarter of last year, when the total was only $680 mn. Deals in the fourth quarter of 1997 reportedly fell just short of $3 bn, rising to about $5.5 bn in the first quarter of 1998. South Korea and Japan accounted for most of this increase in the value of takeovers. Finally, as a result of all this the usable foreign reserves rose sharply from less than $9 bn in December 1997 to over $40 bn in August 1998, surpassing expectations.

So the issue is not one of the persistence of a lack of confidence but of the fact that the return of such confidence has failed to spur economic recovery. This is because the kind of flows that sustained the speculative bubble of the mid-1990s cannot be expected any more. On the other hand, the IMF's 'adjustment strategy' which put South Korea on a traverse involving direct deflation through sharply curtailed capital formation, enforced bankruptcies and reduced government expenditures, has set off a cumulative decline which slightly more permissive fiscal regimes and restored investor confidence are finding too difficult to reverse. Within the IMF's framework, only a sharp turnaround in exports could have provided a new stimulus to growth. Unfortunately exports are taking a beating as the contagion from east Asia spreads to other parts of the world and begins to tell on growth in the industrialised countries as well. As Table 10 shows, to the extent that South Korea has been able to keep exports stable with the help of the depreciated 'won', the destinations which have mattered are the industrialised countries. While such exports have shown high and rising growth rates in recent quarters, exports to developing countries affected by the crisis have been contracting. However, if growth in the industrialised countries slows substantially, as is now widely expected, one dampening influence on the downslide in South Korea's GDP would [illegible] making even the much revised IMF estimates of negative growth for this year look like gross underestimates. Clearly, the IMF's policies have set South Korea on a disastrous traverse which creates conditions that undermine the ability of the system to realise the principal goal of the strategy: a restoration of growth with stability.

Further, the downward slide of the real economy is making the process of dealing with the financial crisis even more difficult. As we have mentioned, for the corporate sector the results of IMF-style deflation have been disastrous. Corporate insolvencies that averaged around 3,500 companies a quarter during the first three quarters of 1997 and rose to more than 6,000 during the last quarter were close to 9,500 during the first quarter of 1998. This has a financial implication. Corporate insolvencies were precisely the reason for the sharp rise in the non-performing credit of the Korean banking system in 1997. The non-performing credit ratio increased sharply to 6 per cent at of the end of December 1997 from 3.9 per cent at the end of 1996, because of the bankruptcies of large companies such as Hanbo, Kia, Halla, Sammi which held large outstanding credits. What emerges from Table 11 is that the non-performing credit ratio of the South Korean banking system actually fell from an average of around 7 per cent during 1990-93 to an average of about 5 per cent precisely during the years of the credit financed boom in South Korean industry during 1994-96. It was the subsequent reduction in growth that pushed this ratio up once again, by making it difficult for South Korean corporations both to cross-subsidise their operations and to meet their debt service commitments. With the collapse of growth this year, in all likelihood the ratios will touch new highs, unless they are 'concealed' through bank restructuring.

The implications are clear. The IMF's recipe for South Korea has not only failed to restore growth, but has also contributed to a worsening of the core financial crisis. So long as the costs of that 'error', determined by an overwhelming concern with protecting the interests of international finance and winning its confidence once again, were borne by South Korea's workers and white collar employees, the west accepted the virtual economic genocide of a nation. But as the evidence grows that the consequences of the crisis would touch on the bottom lines of the large corporations of the west and erode the livelihood of its own population, disillusion-

ment with the IMF has grown. But just as is true is Russia, in South Korea as well, this belated realisation could offer little to reverse the decimation of what was a vibrant domestic economy.

V
Conclusion

It is now being acknowledged by almost all observers that the current crisis in emerging markets may be more than a passing tendency or a simple cyclical downturn in the pattern of capital flows. It could be the beginning of the end of a particular phase of international capitalism, in which deregulation and increased economic integration – the typical features that are described as 'globalisation' – have led to dramatic material changes as well as a much greater degree of volatility and uncertainty.

It is increasingly evident that there is very little option to greater regulation of volatile capital flows, for developing countries who need a minimum degree of stability to pursue their own developmental goals. The alternative, it is now clear, is both too uncertain and too costly in terms of the economic devastation wreaked on citizens. Thus, in the most significant 'emerging markets' – those in east and south-east Asia, along with Russia – most domestic macro-economic changes in the past decade have been driven by capital flows, rather than the other way around. And because these capital flows have been relatively unregulated thanks to financial liberalisation, they have created domestic economic pressures which governments have been powerless to confront.

The most stark evidence of this comes from the extent of the macro-economic adjustment which has been forced on the south-east Asian countries in the wake of the capital outflow. Table 12 gives the pattern of current account deficits in these countries in the recent past. In the current year, barring Philippines which has managed to keep its surplus small, the other ASEAN-4 countries and South Korea are likely to be forced to generate current account surpluses of between 3 and 13 per cent of GDP. The most dramatic changes are in South Korea and Thailand, which have moved from the fairly large deficits of 1996 to relatively huge surpluses in 1998. These surpluses have been squeezed out of economies which are contracting heavily, and have meant declines in personal disposable income far in excess of the fall in domestic output. A look at the nature of the trade flows that have created such current account patterns is even more telling. Despite the massive devaluation of currencies in the region (by around 40 per cent for most currencies and nearly 80 per cent for the Indonesian rupiah) exports in dollar terms have hardly increased and in some cases have even declined. This is in spite of the huge effort in terms of increased export volumes. Thus, the improvement in trade balance has had to come from massive import compression in these economies, reflecting the general state of worsening depression.

The message for other developing countries is clear, and should not be allowed to disappear in the miasma of misrepresentation that the IMF and other institutions are seeking to spread, by focusing on 'crony capitalism' and other such tendencies which are clearly present in every single capitalist country, including those of the advanced west. Developing countries simply cannot afford to allow completely unregulated capital flows, and will have to rely on various different ways of controlling and regulating such flows in accordance with national priorities. Freedom from the uncertain pattern of growth driven by capital flows, in turn implies that these countries have to ensure that vulnerability on the current account is constantly under check. What the south-east Asian crisis suggests is that even medium-term export gains are not a guarantee that excessive trade liberalisation cannot lead to greater dependence on capital flows and a possible economic downturn.

[This is a revised version of a paper presented to a conference on 'The Economic Crisis in East Asia and Its Impact on the Local Population', Roskilde University, Denmark, October 29-30, 1998.]

BJP's Defeat in Vidhan Sabha Elections, 1998

Widespread Erosion of Support Base

Sanjay Kumar

The assembly election results to the three north-Indian states shows that the disenchantment with the BJP is spread across all sections of the society. Not only was the party never the first choice of the dalits, the adivasis or the poor, it seems to have also lost support of the educated young elite and upper castes, the traditional base of the party.

THE results of the recently concluded vidhan sabha elections in four states marked a major political defeat for the BJP, Never before has a party in power at the centre been so badly defeated in a major round of state elections within a few months of forming the government. Usually the performance of a central government is not reflected in an election to the state assembly. Does the defeat of the BJP signify a vote against the performance of the central government?

The Congress, on the other hand, had a taste of electoral success after a long time. While it captured political power in Delhi for the first time after the creation of the Delhi assembly, it returned back to power in Rajasthan after a gap of eight years. More importantly, against all odds, it managed to register a second successive victory in Madhya Pradesh(MP). Its joy was not entirely unmixed, for it lost the elections in Mizoram after being in power for about ten years. Should the victory of the Congress be looked upon as the beginning of the comeback trail for the party at the national level? Also does the poor performance of the Third Front in all the states signal its end?

This article does not seek to answer fully these large questions which have engaged the attention of the media in the aftermath of election results. It seeks to achieve a modest objective, namely, to bring out some of the patterns inherent in the election verdicts. I begin the analysis with a close look at the electoral outcome in terms of votes and seats. This enables me to pose and tentatively answer some preliminary questions about explaining the nature of the verdict. I will then proceed to try and present a social analysis of the voting behaviour. I will question the prevailing wisdom that the BJP lost in the three north Indian states because some sections of the society swung decisively against it since the Lok Sabha election.

This analysis uses two kinds of data. The aggregate data on the current election results which is based on the preliminary data released by the Election Commission on the web (www.eci.gov.in). The aggregate data on the past elections and some reprocessing of the current data from the centre for the Study Of Developing Societies (CSDS) data unit. The article depends heavily on survey data for social analysis of voting behaviour which is drawn from the exit poll conducted by the CSDS in all the four states where elections were held. The sample for the exit poll was selected by multi-stage random method using the probability proportionate to size (PPS) technique in all the four states. Considering the variation in size of the different states, different proportion of the total seats was selected, i e, 25 per cent from Mizoram, 20 per cent from Rajasthan and 15 per cent from MP so that the size of the sample does not become too small for a small state. As a special case we selected 35 assembly constituencies in Delhi, practically every alternate constituency. From each selected constituency, three polling booths were randomly selected. In Delhi, however, four polling booths were selected from each constituency.

On interviewing approximately 50 respondents from each polling booth, we collected a sample of 1,472 from 30 booths in Mizoram, a sample of 5,822 from 120 booths in Rajasthan and a sample of 6,146 from 144 booths in MP. On interviewing approximately 35 respondents from 140 polling booths in Delhi, we collected a sample of 4,778 respondents.

The Verdict

The BJP suffered a major defeat in Delhi in these elections. The party had registered a thumping victory during the 1993 vidhan sabha election. It had won 49 seats and secured 42.8 per cent votes while the Congress had won only 14 seats and secured 34.5 per cent votes. The popularity of the BJP showed an upward trend in the two successive elections held thereafter. During the 1996 Lok Sabha elections, it polled 49.6 per cent votes. In the 1998 Lok Sabha elections, the party led in 52 vidhan sabha segments and polled 50.6 per cent votes.

In the recently concluded assembly elections, the BJP won only 15 seats and polled 33.9 per cent votes with the Congress securing 47.7 per cent votes and as many as 51 seats (see Table 1). The Third Force only got a notional presence. Shoeb Iqbal won the lone Janata Dal seat from Matia Mahal. The two independents, Matin Ahmed and Ram Singh, both Congress rebels, were successful from Seelampur and Badarpur constituencies respectively

The past one decade of politics in Rajasthan has witnessed a complete decline of the Janata Dal as a political force in the state. The marginalisation of the Janata Dal started soon after the 1990 vidhan sabha elections and very soon it was completely wiped out of the political map of the state. The absence of the Third Force resulted in a two party contest in the state. Both the contesting parties had a keen contest during the 1993 vidhan sabha elections. The BJP won 95 seats with 38.6 per cent votes while the Congress bagged 76 seats with 38.3 per cent votes. In terms of popular votes, both parties were very close but the widely scattered votes for the Congress, however, resulted in lesser number of seats for the party as compared to the BJP. With the further decline of the Janata Dal, votes for both the contending parties increased during the 1996 Lok Sabha elections. The Congress polled 40.5 per cent votes while the BJP polled 42.4 per cent votes. But reversal of the trend for two parties began during the 1998 Lok Sabha elections when the Congress led in 123 vidhan sabha segments and polled 44.6 per cent votes while the BJP led only in 56 seats and polled 41.5 per cent votes. The trend continued in the recently concluded vidhan sabha election. The BJP managed to win only 33 seats and polled 33.3 per cent votes while the Congress won a thumping majority of 150 seats and polled 44.8 per cent votes (see Table 2).

The impressive performance of the BJP in MP during the last two Lok Sabha elections in 1996 and 1998 made many believe that the party may win in the state this time. In the 1996 Lok Sabha election, the BJP won 27 Lok Sabha seats and polled 41.3 per cent votes while the Congress got only eight seats with 31 per cent votes. The performance of the BJP

further improved in the 1998 Lok Sabha election when it led in 222 vidhan sabha segments and polled 46 per cent votes. But the party suffered a setback in the recently concluded vidhan sabha election. The result of this elections is quite similar to that of the 1993 vidhan sabha election in the state. As compared to 117 seats and 38.8 per cent votes in 1993, the BJP won 119 seats and polled 39.3 per cent votes this time. The Congress in the recent election won 172 seats, only three seats less than those it had won during the 1993 vidhan sabha election and polled 40.6 per cent votes as compared to 40.7 per cent votes in 1993.

However, in fact, this election was very different from the 1993 election if we look at it in terms of the results in different regions of MP. The Malwa has been a stronghold of the BJP during the past few elections and the party had won 47 seats from here during the 1993 vidhan sabha election. In this election it lost a large number of seats here. It won only 24 of the total 89 seats here while the Congress won 61 seats and virtually swept this region. The Vindhya Pradesh is the region which touches the boundaries of Uttar Pradesh. In this region, the BSP had managed to increase its support base during the past few elections to a great extent, the Congress was relatively strong while the BJP had performed poorly. But this election marked the reversal of trend for both the parties in this region. The BJP doubled its seats winning 30 of the total 68 seats from this region, while the Congress went down to 23 from 37 seats it had won during the 1993 vidhan sabha election. The BSP also suffered a loss of three seats here and won only seven seats. In the tribal dominated the Chattisgarh region, which accounts for a total of 90 seats, the Congress suffered a loss of six seats and won 48 seats. On the other hand, the BJP increased its tally from 30 to 36 in this region. In the Mahakoshal region which acounts for 73 seats, the loss of four seats for the Congress was the gain for the BJP in this election. The Congress won 40 seats while the BJP improved its tally from 25 seats in 1993 to 29 seats in this election. So the regional pattern of the results makes it somewhat clear that there was a massive change in results in different regions of the state.

The victory of the Mizo National Front (MNF) in alliance with the Mizoram People's Conference (MPC) in the Mizoram elections has ended a decade long Congress rule headed by Lal Thanhawala in the state. In the 1989 vidhan sabha elections, the Congress won 23 seats in a 40-member house and formed the government headed by Lal Thanhawala. In the subsequent vidhan sabha election held in 1993, the Congress entered into an alliance with the Peoples Conference of Brigadier T Sailo. This regional front had joined the Janata Dal soon after the 1989 Lok Sabha election but even before the 1993 vidhan sabha election, it had withdrawn from the Janata Dal and named itself the Mizo Janata Dal. It consequently formed an alliance with the Congress, but its candidates contested as independents. During the 1993 vidhan sabha election, the Congress won 16 seats and polled 26.5 per cent vote but in alliance with MJD whose eight candidates won as independents, and formed the government headed by Lal Thanhawala.

The decline of the Congress started since the 1998 Lok Sabha elections when it led in only 13 vidhan sabha segments and polled 34.9 per cent votes while the Citizens' Common Front led in 25 vidhan sabha segments polling the same amount of votes. The MNF led in only two vidhan sabha segments and polled 26.8 per cent votes. In the recently concluded vidhan sabha elections, the Congress won only six seats and polled 29.8 per cent votes while the MNF won 21 seats with 25 per cent votes and its alliance partner in this election, the MPC won 12 seats polling 18.1 per cent votes (see Table 4).

Flow of Seats

One might think that in the wave against the BJP in MP, Rajasthan and Delhi, the party might have won only its strongholds. But surprisingly this is only true in Delhi where the Congress not only won a large number of seats, but also managed to retain all the 14 seats it had won in 1993. It is clear from Table 5 that the BJP also managed to retain the 15 seats it had won during the 1993 vidhan sabha elections. But this does not apply to the results in MP and Rajasthan.

If we look at the MP results at the constituency level, we find that there is a massive change as compared to the results of the 1993 election. Both the Congress and the BJP won nearly similar number of seats, but these are not necessarily the seats won by these parties in the earlier election. In fact, this time both the BJP and the Congress won a large number of new assembly seats and lost seats they had won during the 1993 vidhan sabha elections. Table 6 makes it clear that of the total 172 seats won by the Congress, it managed to retain only 103 seats and lost 59 seats to the BJP. At the same time it won 69 new seats of which 60 seats came from the BJP. It is not that the BJP won only in its strongholds. The BJP lost in more than half of those constituencies it had won in 1993, but at the same time secured 59 of those constituencies which were taken by the Congress in the previous election. This major change of seats from one party to the other in this election points towards anti-incumbency working against the party as well as the sitting MLAs. The voters rejected those candidates whom they disliked or who had not performed.

Even in Rajasthan in these elections, the BJP only managed to retain only 16 of the total 94 seats it had won in 1993 while it gained 15 seats from the Congress. It is clear from Table 7 that the Congress registered a major victory in this election winning a total of 150 seats. The Congress lost 15 of its previous seats to the BJP but at the same time won 75 seat which had been earlier held by the BJP. So there was a massive change in the results at the constituency level.

After winning two successive elections in Mizoram, the Congress was badly defeated in this election. It won only six seats but still managed to retain two of its previous ones. The MNF retaining nine seats lost two of its previous ones to the Congress. The large number of others in Table 8 represent different state parties as every new election in Mizoram witnesses the coming of a new party and the end of some existing ones.

Explaining the Verdict

The defeat of the ruling party in an election is generally summed up as an anti-incumbency effect by that party. If the Congress had lost the elections in MP, the BJP would have used the lame excuse of anti-incumbency to cover up their failure. Awestruck, the BJP leadership blamed the recent price rise of essential commodities for the party's thorough defeat. Escalating onion price, which had given the opposition a rallying point against the BJP government, ironically provided an excuse to the BJP leadership. Nature, God and 'Congress hoarders' were to be blamed for the BJP's defeat, said the party leadership. Our analysis, however, suggests that while price rise did have an impact on the electoral outcome. It was, however, not the only factor.

A look at the CSDS exit poll data does reveal the growing disenchantment of the people on the issue of price rise. It drove a large section of people away from the ruling party, the BJP. The data confirms that price rise was the biggest issue in this election. It influenced the choice of about 33 per cent voters in MP, 30 per cent voters in Rajasthan, 44 per cent voters in Delhi. However, a mere six per cent voters felt this was an issue in Mizoram. This could be because of the fact that there were other pressing issues the people were facing there. Corruption was one.

But this does not signify that it was a negative vote against the central government only on the issue of price rise, which was capitalised by the Congress. It may be somewhat true for the states of Rajasthan and Delhi where the BJP was in power at the state level, but it would be unjust to conclude the same for the Digvijay Singh government in MP. The CSDS exit poll confirms that a section of people in MP voted for the Congress because of the developmental work done by the Congress government. Of all those who voted for the Congress in MP, 24 per cent were influenced by the issue of development while in Delhi only nine per cent took this into consideration. In Mizoram, of all those who voted for the MNF and the MPC, 47 and 48 per cent respectively, were influenced by the issue of corruption.

If the rising prices of essential commodities, especially vegetables, turned a large number of people away from the BJP in general, the deteriorating law and order situation and general misgovernance during the last few months made the situation even worse for the party in Delhi. The CSDS exit poll indicates that nearly 44 per cent people were dissatisfied with the performance of the state government in Delhi and only 21 per cent were satisfied. A last minute change in the BJP leadership in Delhi to contain the growing discontent against the party did not work, and people in large numbers voted against the BJP in Delhi.

Nearly eight years of Bhairon Singh Shekhawat's rule has made BJP quite unpopular in Rajasthan. It is telling that 44.4 per cent people said that they were not satisfied with the performance of the state government. To make the situation worse, as high as 36 per cent people were

also not satisfied with the central government where BJP is in power. It was not merely price rise which influenced voters choice, but corruption was also a major issue with a large number of voters. With growing dissatisfaction, the party, which had already witnessed a decline during the 1998 Lok Sabha election, was voted out of power by the people of Rajasthan.

It cannot be claimed that people were absolutely satisfied with the performance of the state government in MP, but developmental works initiated by the government left its impact on the election results. The benefits enjoyed by the people on account of the decentralisation of power to the local bodies, the provision of a primary school within a kilometre of any village that sought it and the watershed management projects to a great extent translated into votes for the Congress. Internal rivalry among party leaders and disgruntled rebels made the situation worse for the BJP and contributed to its second successive defeat in the state.

Ever since the two regional parties, the MNF and the MPC, formed a joint front, it was almost certain that the Congress would face a rough weather in the state it had ruled for almost 10 years. The emergence of the United People's Party, a coalition of splinter group of MNF and social activists added to the Congress's problems. Various corruption charges were levelled against the decade-old Congress government, which had its own impact on the voters. The CSDS exit poll confirms that corruption was the leading issue for the majority of voters in the state. This single issue influenced the choice of nearly 38 per cent voters. Among them 41 per cent voted for MPC and 28 per cent voted for MNF. Besides, in a state with a high level of literacy, the rising unemployment among the youth had eroded the ruling party's image and fuelled the anti-Congress sentiment.

Support Base of Political Parties

The convincing defeat of the BJP in the three states suggests that it has lost support among various sections of the society. But is its support spread evenly across all sections or is it strong among some and weaker among others?

The BJP had an enormous growth during the last two Lok Sabha elections held in 1996 and 1998 when it emerged as the single largest party in the Lok Sabha winning 161 and 179 seats respectively. This growth is largely attributed to the growing popularity of the party among various sections of the society. But surveys in the recent past has confirmed that the appeal of the party is not evenly spread across all sections of the society. Its social base is heavily skewed in favour of a few sections of the society. The support for the BJP is high among young voters, the upper caste, the educated and people with high occupation. Although some from the deprived sections of the society – the dalits, the tribals, the poor and people with low education – moved towards the BJP during the past few elections, the majority of them still voted for other parties. The CSDS exit poll conducted during this election reveals the support base of different parties among various social groups.

The decline of the BJP votes in all these three states makes one believe that the party has lost the backing of all sections of society, but a careful analysis of the results reveals that the party still draws large support from those social groups which voted for it in large numbers during the past few elections.

In urban areas, Congress got more votes than the BJP. The survey, however, shows that support for the BJP among urban voters is still higher in context of the total votes of the party. During the last few elections, the upper caste voters had gone for the BJP in large numbers but did not do so in this election. The exit poll reveals that the upper caste voters were divided equally between the Congress and the BJP in Rajasthan while they were slightly tilted in favour of the BJP in Delhi. But compare the votes for these two parties among the

Average vote (actual results)	47 7	33.9	44.8	33.4	40.6	39.3	6.2

Note: The variation of support among different social sections has been calculated from the survey figure assuming that the discrepancy between the actual vote and the survey vote is evenly distributed among all sections.

Table 10: Satisfaction with State and Central Government

Level of Satisfaction	Delhi		Rajasthan		MP		Mizoram	
	State Government	Central Government	Central Government	State Government	Central Government	State Government	Central Government	State Government
Not at all satisfied	44.1	39 8	44.4	35.7	37.1	27 7	62 6	28.1
Somewhat satisfied	31.3	32.4	26.1	29.3	27.6	29.0	19.8	31.7
Very satisfied	21.3	23.3	25.8	29.7	27.3	32.9	13.3	15 3

upper caste as compared to their total votes. It will emerge that in spite of the reduced support for the BJP, this party is still popular among the upper caste in the three states.

In spite of the decline in support for the BJP among people with high education, white collared and professionals in the recent elections as compared to the previous elections, this party still draws large support from these sections of the society. Even though the Congress registered an impressive victory in these elections, its support among highly educated voters still remains low in all the three states.

The success of the Congress lies in the large support the party received from the poor, deprived and underprivileged sections of the society. The dalits, which constitute 19.6 per cent of Delhi's population, voted in large numbers for the Congress. In MP, the Bahujan Samaj Party received large support from the dalits. The Congress received overwhelming support from the tribal voters both in MP and Rajasthan.

The illiterates and poor people voted for the Congress in large numbers while the BJP received a raw deal from them. In Rajasthan and MP, the support for the two parties among the illiterates is not very lopsided. In Delhi, these voters clearly preferred the Congress. Voters with low occupations also chose the Congress in Delhi. There is also a shift in the preference of women and young voters during this election. They moved away from the BJP who they had supported during the last few elections in large numbers. A majority of the young voters in Delhi and Rajasthan backed the Congress. Women voters in all the three states did the same.

These findings prove that the upper class and upper caste character of the BJP has still not changed even after the party has been badly defeated. The Congress which used to be a party of the poor and the deprived in the past, but was facing rough weather during the past few elections, mainly at the hands of the Third Force, managed to win back the support of its traditional voters in the absence of the Third Force.

Swing of Votes from BJP to Congress (1998 Lok Sabha to 1998 Vidhan Sabha)

It is true that the BJP still draws more than its average support from some higher social groups while its popularity is below average among the lower social sections, especially the dalits, the tribals, the illiterate and the other underprivileged. But does it mean that the shift of votes from the BJP to other parties has been uneven, large in some sections of society and small in others? Many newspaper analysts have argued that the BJP was defeated because the lower sections of society – dalits, adivasis and OBCs – who had moved towards the BJP in the recent years switched their loyalty back to the Congress. If this was true, we should expect a clear divergence in the proportion of voters who swiched their loyalty from the BJP to the Congress between the Lok Sabha election in February 1998 and the November Assembly elections.

The CSDS exit poll was designed to test this hypothesis. We asked the voters to indicate not only who they had voted for that day but also to recall who they had voted for in the February Lok Sabha elections. The recall turned out to be fairly reliable. The figures presented through Table 12 to 16 are of the voters who shifted from the BJP to the Congress. The figures show the proportion of all voters of society. Among urban voters, the BJP support base is above its average, but there is little difference in the swing among the urban and the rural voters.

There is almost an even swing among all age groups of voters from the BJP to the Congress in all the three states. Though the decline of support for the BJP among the younger voters, who backed the party in earlier elections, is sharp, in terms of swing away from the BJP to the Congress it is more or less even. The swing is highest among middle age group voters in all the three states (see Table 13) because this working section of the society felt the pinch of price rise most.

If we look at the vote for the BJP among various occupational categories, we find that the party has received above average support among voters of high occupation and below average from those who belong to low occupations in all the three states as mentioned in Table 15. But it does not mean that the shift of voters among high occupation is less than that of voters in low occupation. There is almost a similar shift among all occupational categories. The swing is slightly higher among the high services in all the three states.

The BJP enjoys higher than average support among voters with high education. It got below than its average votes from illiterates during the recently concluded elections. Does this mean that the swing among the educated is lower than among the illiterate? The CSDS exit poll shows that the swing among all sections is more or less even except for the great swing among the highly educated voters in Rajasthan.

Even among voters belonging to different caste communities, it is hard to find uneven swings from the BJP to the Congress during this election. There are only a few exceptions. The swing among upper caste has been slightly higher in Rajasthan, somewhat higher among the Sikhs in Delhi and marginally higher among the tribals in MP.

What do these results show? What does the trend portend for the future? One thing is crystal clear. The disenchantment with the BJP is spread across all sections of the society. It is wrong to assume that the party lost these elections because certain sections of the society switched their loyalty. The BJP lost support in all sections. Chinks developed in the BJP's pocket-boroughs, the educated young elite and upper castes. It is also clear that the party is not the first choice of the dalits, the adivasis or the poor. There is a clear signal that the party will have to go beyond Ayodhya and Pokhran to retain its base. At the same time, everything is not hunky-dory for the Congress either. Though the party won the elections in MP and Rajasthan, many of its sitting MLAs lost in their constituencies. If anything, these elections suggest that performance is the key mantra. Rhetoric alone cannot win elections, it has to match with actions.

People in Protected Areas

Koyna Sanctuary in Maharashtra

Milind S Bokil

If a meaningful debate is to take place on what appear to be conflicting needs and claims of wildlife preservation and forest and people's rights, we need to understand the historical, and ecological and socio-cultural issues in each of these areas. This case study of Koyna sanctuary and the people of the area is such an attempt.

IN India environmental awareness is steadily on the rise. It has been realised that the great mass of flora and fauna in the subcontinent is threatened due to the increasing pressure of urbanisation, industrialisation, commercialisation and ecological degradation. Various attempts are, therefore, being made to protect, regulate and conserve these resources situated in various ecosystems. A concrete manifestation of these efforts is found in the increasing notifications of wildlife sanctuaries, national parks and game reserves. However, these conservational efforts have also triggered off a controversy. It has been found that very often the notifications of protected areas transgress upon the rights and livelihood interests of the people situated in such areas and lead towards their displacement from the ancestral habitat. In fact, an intense debate about the justification, planning and management of the protected areas has been ensuing among forest officers, conservationists, environmentalists on the one hand and social activists, local community leaders and human rights advocates on the other [Kothari et al 1995:2755]

In order to sustain this debate and come to some meaningful conclusion, it is necessary to have systematic knowledge about the ground reality. It is essential to understand the historical and ecological setting of the concerned area, the livelihoods activities of the people and the socio-cultural and physical conditions. Above all, it is important to understand the wishes and aspirations of the affected people. What is required is a socio-anthropological approach with which a complex and multifaceted reality could be comprehended. Unfortunately, this is easier said than done. What one encounters is the insensitive, bureaucratic and rigid stand of the proponents on the one hand and emotional, unrealistic and equally dogmatic attitude of the protesters on the other. As pointed out by Guha (1997:349), the need is to have sociological studies of the origins of conflicts in the protected areas, their unfolding over time and the paths by which they may be resolved. This study of the Koyna sanctuary in Satara district of Maharashtra, is an attempt in that direction.

The Koyna dam is one of the largest dams in the Western Ghats. However, unlike other dams it has been constructed mainly for hydro-electric purposes. Its uniqueness lies in the fact that an eastward flowing river, Koyna (originating at Mahabaleshwar), was impounded in the hills and its water was diverted to the Konkan region on the west through tunnels built into the mountain. The dam and the associated hydro-electric works are considered to be engineering marvels.

The dam was completed in 1962 and submerged 98 villages in the Koyna valley. The distance from Mahabaleshwar to the dam site at Koynanagar is about 86 km. The villages belonged to two talukas, Javali and Patan. Historically, this was the area where Shivaji established his kingdom. The Koyna site was one of the most ideal sites in the Western Ghats and even the Tatas had eyed it for constructing a hydro-electric power station before independence. They abandoned the idea after the experience of Mulshi dam in Pune, where stiff resistance to the dam was offered under the leadership of the veteran freedom fighter, Senapati Bapat.

The displacement due to Koyna dam was the biggest of its kind in Maharashtra. The state government had offered to resettle all the dam oustees but the sites offered were scattered at far away places. Hence, in the first phase of this operation, only about 30 per cent of the villagers preferred to move out of the district. They were resettled at various localities in Thane, Raigad, Sangli and Solapur districts. The remaining villagers did not opt for the sites provided by the government and preferred to move either on the upstream hill slopes or downstream plains in the vicinity. The rehabilitation of the dam-oustees was a lengthy and tiresome process which has not been completed yet.

Koynanagar as the centre of a massive earthquake in 1967 which took a heavy toll in Maharashtra. There have been contrasting opinions about the correlation between seismic activities and the storage of water. The people on the downstream, however, panicked thinking that the dam might burst. Many of the dam-ousted families, who had come out of the catchment area and were settling downstream, decided to go back into the mountains. The local politicians encouraged them to do so. The irrigation department released the surplus land in their custody (which was acquired for the project but not used) and these people were resettled on the upstream hill slopes. Though the population was considerably reduced, about 55 villages were thus relocated in the catchment area (25 at the Patan end and 30 at the Javali end).

The combined population of these villages today is around 9,500. Needless to mention, they have been encountering considerable hardships, the most obvious being the problem of transportation and communication. The upstream villages are totally cut off from the surrounding world. The state government provided them pieces of land but did not provide any other facilities. Life has been miserable in the absence of roads, schools, dispensaries, markets, electricity, drinking water and other basic amenities. A ferry launch was started by the zilla parishad only in 1978. Till then, villagers from places like Dicholi in the Patan area had to cover a distance of nearly 40 km on foot to reach Koynanagar. Primary schools were opened also about the same time. Till date, there has been no primary health centre. Electricity has been provided only at a few places. The condition of about 20 villages in Javli area has been a little better as they have access from Satara and Maha-

baleshwar. But people in the remaining villages, especially in the Patan area, lead a pitiable existence.

The Koyna sanctuary is notified over the whole catchment area. Though it covers all the 55 odd villages, six villages in Patan taluka falling in the central core region have been the worst affected. These villages are nestled in the high mountain ranges at an altitude of about 3,000 ft. They are Mura, Kisrule, Zadoli, Ambeghar, Punavali and Dicholi. The original locations of these villages, except Dicholi, were submerged and, hence, they have been relocated at an altogether different and higher site. Dicholi was spared because it was previously situated on a hill top. At present, the ferry launch is the only means of transportation. It takes about two hours to reach these places from Koynanagar.

The Koyna region is characterised by broad hill plateaux around the peak of Mahabaleshwar. This is a very high rainfall area (6,000 mm and above). Traditionally this area has been inhabited by two communities: kunbis and dhanagar gavalis. The kunbis (also called as marathas) are the main agriculturist community in Maharashtra whereas the dhanagar gavlis belong to the dhanagar caste cluster who are shepherds and cowherds. Historical evidence suggests that these communities came to this mountainous tract from the eastern direction. The plateau lands on the east were earlier inhabited by animal rearing agriculturists. The first farmers of this region have been related to the post-Harappan period starting from 1800 BC. They were residing in the river valleys and there was no sharp differentiation between the agriculturists and the pastoral nomads. However, by about 1000 BC, the area witnessed a long span of aridity which destabilised the agricultural systems and some groups took to shepherding and cow or buffalo herding [Dhavalikar 1985].

The ecological history of this region is traced by Gadgil and Malhotra (1982). They have pointed out that the domestication of animals and plants as well as sedentarisation originated in the semi-arid tract of the Deccan plateau and spread into the higher rainfall zone. This implied a progressive destruction of tree growth into the higher and higher rainfall area. The destruction of gallery forests along the water courses in the semi-arid tract eliminated the possibility of a single pastoral group maintaining sheep and buffalo. The shepherds, therefore, remained in the semi-arid tract while buffalo herding dhanagar gavlis moved upstream of the water courses into the deciduous forest zone (at the foot hills) to the west. The agricultural frontier expanded with the kunbis coming into the area. As the tree growth in the deciduous zone was removed and land brought under cultivation by the kunbis, the gavlis had to move farther west into the higher rainfall zones towards the crest of the Western Ghats. The ability of the peasant community to displace the pastorals has been traceable to their numerical superiority, which has been due to the higher carrying capacity of the land for cultivators in comparison to the pastorals [ibid: 115].

Before the construction of the dam the kunbis resided in the valleys. They far outnumbered the gavlis staying on the hills. Even today, when both the groups are residing on the hill slopes, kunbis occupy the lower levels whereas the gavli hamlets are at a higher altitude. Traditionally, the kunbi villages also included the artisan and ex-untouchable castes. Almost all the artisans have now shifted out of the catchment area and the same is true of the ex-untouchables. At present, only a few families of the latter have been residing in the mountains. They have been classified as neo-Buddhists after their conversion to Buddhism but are appropriately called dalits.

The spatial differentiation between the kunbis and dhanagar gavlis gave rise to two distinct economies, agricultural and pastoral. The gavli dhanagars reared buffaloes without traditionally owning any lands. In Dicholi, however, they received lands under the Tenancy Act. In fact, many of the kunbis and dalits also received lands under the Tenancy Act. A large portion of land in these villages was assigned as 'inam' (land grant) to local chieftains and feudal landlords during the Peshwa rule in 18th century. The British colonial administration promulgated ryotwari settlements but did not disturb inam rights. They were abolished only after the independence under the land ceiling and tenancy reforms. Consequently, the kunbis began to cultivate the low lying paddy fields whereas the land owning dhanagars practised shifting cultivation on the hill slopes and grew ragi ('Eleusine coracana') and varai ('Setaria italica'). At present, as both the communities reside on the hill slopes, ragi and varai are the principal crops. Paddy is grown only on some small flat terraces. Some pulses and oilseeds are also grown at convenient locations.

The lands on the hill slopes are not measured or demarcated. Hence, though each household knows how much land he/she possesses, its exact location and demarcation is unknown. The lands are cultivated by mutual convenience, collective labour and general understanding. The productivity is very low. On the average, under standard climatic conditions, about six to eight quintals of ragi and three to four quintals of varai is produced per hectare. The productivity of rice is about eight to 10 quintals per hectare. Needless to emphasise, this type of agriculture is precariously balanced on the vagaries of nature.

The six core villages in Patan taluka were selected for the study and all the residents were covered under the socio-economic survey. The number enumerated here pertains to those who came back after the earthquake in 1967 (the gavlis from Dicholi had not moved out). For example, village Kisrule had about 200 households before 1962. About 60 per cent of them shifted to Bhivandi resettlement site in Thane district in 1962-63. The others did not opt for Bhivandi and preferred to settle in the nearby village Helwak on the western side of the mountains. Of them, 17 households came back after the earthquake and started staying at the present site which has been on a higher plane than the original. When the sanctuary was declared in 1985, eight of them again moved out to places where their kin were settled. The present number of 21 households has risen out of the remaining nine households. The number has increased due to successive partitioning among the fraternity. Similar process have occurred in other villages.

As the income derived from agriculture has not been sufficient, supplementary activities are carried out. Whereas the gavlis have relied on animal husbandry, the kunbis and dalits have been traditionally involved in wage labour and service. They have also been migrating out. Some of the migrants are currently working in Mumbai. These persons have been employed mainly as unskilled labourers in the unorganised sector. Many of them have been working as coolies in the vegetable market yards.

The animal husbandry practices of the gavli dhanagars in Koyna region are traditionally tuned to the ecological setting (a good description of the gavlis of Western Ghats could be found in Gadgil and Malhotra, 1982). They prefer buffaloes

over cattle. The buffalo is a sturdy and rugged animal. It can withstand the high altitude rain, cold, wind and other harsh conditions. It can also defend itself against predating animals. The gavli animals are not stall-fed, they are not even tied by a rope. The animals roam around the jungle and are gathered only in the evening. Very often camps are made in the jungle itself. The gestation period of a buffalo is quite long (15 to 18 months). As a result the gavli herd consists of a large number of unproductive animals. The milk yield is not significant. On an average a good milking buffalo produces two to three litres of milk per day. As the animals are free throughout the day, most of their energy is lost in roaming around and hence the feed to milk ratio is low. The gavlis tend to maintain large herds mainly because fodder is obtained free of cost and there is an inherent compulsion to retain the young as well as the unproductive animals for future utility. Previously, when there were no dairy societies, they used to prepare butter and sell it in the Konkan area. They used to retain buttermilk which was their principal source of protein. At present they sell the milk to a local co-operative dairy, started by a voluntary organisation, which operates a launch service. Gadgil and Malhotra, in the above cited study, have concluded that successive ecological degradation of the area has forced the gavlis to move from rearing buffaloes to cattle and goats and lately to wage labour. To some extent this has been also true of the Koyna valley

The agricultural and pastoral livelihoods activities are supplemented by the collection of non-timber forest produce. The principal among them is shikekai ('Acacia concinna') which is sold to the contractors authorised by the forest department. Similarly, kadhi patta ('Murraya koenigi') is gathered. Another important item is honey. Seasonal fruits like mango, karavanda ('Carissa carandas'), jambhul ('Eugenia jambolana'), amla ('Emblica officinalis') are also collected but they are consumed locally. There are a number of medicinal plants in the region but market channels are not well established yet.

The educational details of the respondents are provided in Table 1. It can be seen that the average adult literacy is as low as 24 per cent. The literacy level of the gavlis is very low. Female literacy is still lower. The literacy levels have been low because there were no schools after the dam was built. At present, schools are there only at Zadoli and Dicholi. The Dicholi school is in a good condition but the Zadoli building is dilapidated. The problem at both the places is that teachers do not come regularly as there is no convenient transportation. The quality of education is extremely poor as the schools are not equipped with any teaching material or educational aids. There is, however, a strong desire among the people to educate their children. This could be vouchsafed by the impressive number of children attending the schools. About 40 per cent of them are attending schools outside the dam area. Around 35 children from Dicholi are staying at Koynanagar for their schooling. A couple of them have passed SSC and are attending junior colleges. Only two people from Dicholi have completed graduation.

The absence of education and lack of exposure to outside world has had its effect on the socio-cultural life of the villagers. Superstitious beliefs and blind faith have been quite common, especially among the gavlis as traditionally they remained aloof from the rural society. These beliefs have caused considerable social trauma and disturbances. The position of women has been quite low among these communities, particularly among the gavlis. The women are anaemic, overworked, illiterate and repressed by the patriarchal system. Till recently, child marriage was the norm. The constricted character of the traditional society was exacerbated by the isolation and dislocation caused by the dam.

In the area under study a voluntary organisation named Shramajivi Janata Sahayyak Mandal (SJSM) has been active. This was founded by a local youth, Bal Kolekar in 1979 who comes from a modest dhanagar gavli family from Dicholi. His father was recruited in the Indian army in the second world war. Bal studied at Satara. He was the first graduate from his community. After graduation, he received training under the graduate volunteer scheme (GVS) of the Bombay University. This scheme was an attempt to attract the educated youth to the field of rural development. After completing this training, Bal came back to his village in the mountains. Unlike other rural youth, he started working for his people living in the Koyna catchment area. He founded the SJSM along with some of the local friends. Initially, an ashram school was started near Koynanagar. Thereafter various issues were taken up. An agitation was launched for basic facilities like education, health, transportation and housing in the catchment area. The SJSM worked with the vision of building people's organisations and initiating the process of development from within. Its emphasis was on establishing co-operative societies. Alongside, it also started a crusade against superstitions and evil practices among the gavli community. The work soon blossomed into multifarious activities as Bal and his colleagues toiled hard with commitment, devotion and perseverance. At present, there are more than 20 co-operative institutions and three voluntary agencies working under the guidance of the SJSM. It has undertaken large afforestation and watershed programmes in collaboration with the forest department and the state government agencies. There are six rural campuses, a herbal garden and research centre, a cane and bamboo production unit, an agricultural farm and a women's co-operative agro-products manufacturing society. In the span of last 20 years SJSM has emerged as one of the most effective NGOs in Maharashtra.

The Sanctuary

An area of 423.55 sq km, falling within the backwater region of the Koyna dam, was notified as Koyna sanctuary by the state government (revenue and forest department vide their notification no WLP/1885/CR/1588(1)F-5, dated September 16, 1995). This area consists of 16,110.94 ha of reserve forest, 6,353.63

Table 1 Educational Details of Respondent Households

Village	Agewise Breakup of Household Members			No of Literate		No of School-Going
	0-6	6-18	>18	6-18	>18	
Mura	11	17	34	9 (53)	3 (9)	9

Dicholi	45	102	178	45 (44)	28 (16)	46
Total	100	231	527	132 (57)	128 (24)	132

Note Figures in parentheses indicate percentages

ha forest closed under Section IV of the Indian Forest Act (1927), 8,221.59 ha in the possession of other departments and 11,966.62 ha of private lands.

The forest is composed of two types: western tropical and sub-tropical broad leafed hill forest and west coast semi-evergreen forest. The prominent fauna consists of tiger, panther, wild cat, wild boar, deer, sambar, chital, mouse deer, chinkara, fox, wild dogs, sloth-bear, monkey, bison, porcupine, python, flying squirrel, etc. and bird species of green pigeon, Indian sand grouse, partridge, paradise fly-catcher, jungle fowls, etc. According to the census conducted by the forest department in May 1995, there were two tigers, six panthers, 57 sambars, 63 deer, 44 bisons, 14 porcupines, 45 bears, 54 flying squirrels, 65 wild boars, 11 langoors, 23 hares, and 10 foxes. The actual strength, according to the information provided by the locals, would be at least twice these numbers. Though conservation work has begun, demarcation of the sanctuary has not been completed yet. The necessary staff has been recently appointed and infrastructure is being established. The land acquisition reports to be filed by the district collectorate are said to have been prepared.

As soon as the sanctuary was notified the provisions of the Wild Life Protection Act (WLPA) 1972 have been brought into effect. Previously, the Koyna area was designated as a reserve forest. The elevation from the status of reserve forest to that of a sanctuary meant imposing more restrictions and curtailment of various rights previously enjoyed by the locals. Some of the provisions of the WLPA would make this point clear.

The WLPA says that "no person shall wilfully pick, uproot, damage, destroy, acquire or collect any specified plant from any forest land and any area specified by notification by the central government and possess, sell, offer for sale, or transfer by way of gift or otherwise, or transport any specified plant whether alive or dead or part or derivative thereof" (Section 17A). Only a member of a scheduled tribe is allowed to pick, collect or possess in the district he resides any specified plant for his bona fide personal use (None of the above communities are recognised as scheduled tribes). The Act also prohibits cultivation of and dealing in specified plants without licence (Section 17C and 17D). It explicitly says that the specified plant or part or derivative thereof shall be the property of the central government (Section 17H). As for hunting, the rules are quite stringent and they prohibit hunting of scheduled wild animals (Section 9). Only in certain cases, as approved by the chief warden, hunting of wild animal is permitted (Section 11). There are also various restrictions on the entry into the sanctuary, and the persons residing in the sanctuary are bound to perform certain duties for the enforcement of the act (Section 27). Immunisation of the livestock kept in or within 5 km of a sanctuary is compulsory and the act says that "no person shall take or cause to be taken or grazed any livestock without getting it immunised" (Section 33A).

Needless to mention, these restrictions adversely affect the traditional lifestyle of people who are intimately dependent upon the forest and are involved in agricultural and pastoral occupations. The act not only hampers their livelihoods activities but also affects their freedom and mobility. It prevents them from taking wild fruit, flowers, leaves, timber, grass, fuel wood and other forest produce which essentially supplement their sustenance. The customs and practices which till date are a part of life have now become crimes and offences.

In the first two to three years the impact of the sanctuary was not discernible and, hence, the people did not take it seriously. But gradually the noose was tightened. Firstly, the forest began to grow as a result of the protective measures. Felling of trees (legal and illegal) was stopped. The forest canopy became thick and extensive. Previously, the forest was at a certain distance from the villages, separated by agricultural fields. But as the villages were resettled on the hill slopes the forest came closer to people and so also the wild animals. Their population also began to increase. The effect of the increased population of the wild animals has been quite decisive. The villagers had been in the habit of using a grass called 'kolamb' for thatching the roof. This grass, which grows on the hill slopes, was consciously preserved by the local people. Before the spread of Mangalore tiles this was the standard roofing material all over the Koyna valley. This grass was totally destroyed by the bisons. They not only uprooted the stalks but also pounded them so that future growth became impossible. The roofs have to be thatched annually before the rainy season. In 1991-92 all the grass was destroyed and the people were shelterless. This matter was brought to the notice of the forest department. However, no action was taken. An agitation was launched under the guidance of SJSM. The forest department did not provide any help but compensatory grants were provided by the then chief minister from the Chief Minister's Fund. Mangalore tiles were distributed in all the six villages and the problem was somehow resolved. The bisons have also attacked human beings. In at least four cases bisons caused serious injuries.

The second problem has been due to wild boars which are a menace to the crops. The ragi and varai fields are along the hill slopes and are easy targets for the boar. No protection has been effective against their assault as they strike mainly at night. They have also been attacking the paddy and corn fields near the villages. Previously, the villagers used to hunt the boar and, hence, their population was kept in control. As hunting was prohibited the boar began to roam freely and menacingly. Villagers report that only 40 to 50 per cent produce can be effectively salvaged. As mentioned earlier, agriculture on the hill slopes was already precarious and the menace of the boar has caused a great set back.

Another intimidating animal has been the black bear which is a herbivorous animal but is notorious for attacking human beings. It particularly attacks the face and upper limbs. It is a matter of common experience that people living in such situations do not fear predators but are afraid of the bear. Previously, the instances of attacks by the bear were known but they were sporadic. With the sanctuary, the attacks have become more frequent. The worst victim has been one Laxman Kolekar from Dicholi whose eight year old son was killed in 1993 by a bear in the vicinity of the village. The children were playing near the stream and suddenly the bear pounced upon them. The older children ran away but two of the smaller ones were caught. One could run away with minor injuries but the other was killed on the spot. His head was broken and the face was completely distorted. The family was given a cash compensation of Rs 10,000 by the forest department and the father of the boy was given employment as labourer on daily wages.

The most alarming threats have come from the population of panther and tiger which has increased due to the protection measures and they have begun to frequent the villages. Cattle and goats are easy prey. There is hardly a household in these villages which has not lost an animal in the last

two years. 56 big animals like cows and bullocks, 33 calves and heifers and 24 goats have been killed by the predators between June 1994 and May 1996. In Dicholi animals have been killed in the vicinity of the villages. Many of them have been lifted directly from the houses. During our stay in Dicholi, a panther visited the village on three consecutive nights and killed three goats. Its pug marks could be easily seen in the morning. Till date, no human being has been attacked but the people have begun to fear that it might also happen.

Another problem has been with regard to the collection of fuel wood and non-timber forest produce. Previously, people could bring fuel wood and non-timber produce safely from the adjoining forest for their domestic use. With the declaration of the sanctuary this activity has become illegal. The forest department has stopped auctioning the non-timber forest produce. Collection, transport and sale of products like 'shikekai' 'kadhi patta', honey and other things have been banned under the WLPA. Thus, a major source of supplementary income has been lost. This loss has been estimated at about Rs 2,500 per annum per household. The forest department has also put restrictions on fishing in the lake. The fishing co-operative established by SJSM has about 50 members and has been authorised by the irrigation department to fish in the lake. The sanctuary administration has, however, taken objection to this activity, the forest department has become very powerful and this has resulted in harassment of people.

Restrictions are also being imposed on the movement of people. Contact with the outside world is being curtailed by the rules and regulations of the sanctuary. The isolation caused by the dam has, therefore, worsened. Since 1993 (after the Mumbai bomb blasts), Koyna lake has been subject to stringent security arrangements Earlier trekkers and mountaineers used to frequent the valley. Now visiting the sanctuary from the Koynanagar end has become almost impossible.

The WLPA is related to the protection of wildlife and, hence, does not speak about the loss of other forms of life. The provisions applicable to the reserved forest area are, therefore, enforced with respect to compensation. The forest department has certain rates prescribed for compensating the loss of animals or human beings. The rates are as in Table 2.

These rates of compensation all shamelessly paltry. The present market price for a goat would range between Rs 900 to 1,200 and that of a cow between Rs 4,000 to Rs 6,000. The price of buffaloes and bullocks are much higher. For the forest department the value of human life is not more than Rs 20,000 and permanent disability is valued at only Rs 6,000. Also, these are the upper limits which are seldom reached while granting the compensation. The forest officials use their discretion and give as little as possible. It was reported that the compensation normally received for a goat ranges between Rs 75 and 150 and that for a cow between Rs 1,200 and 1,800. The discretionary nature of compensation leaves plenty of room for malpractices.

The procedure for claiming the compensation is also complicated and time-consuming. In the Koyna area it has become much more traumatic in the absence of transportation and communication facilities. The person whose animal is killed has to report the incident to the forest official at Koynanagar so that the latter can make a 'panchnama' (inspection). For this purpose the presence of the 'talathi' (village record keeper) is essential because the key issue is the place of the kill. The talathi alone is capable of identifying the survey number of the spot and deciding whether it falls within the boundary of the forest of that of the village. The owner is supposed to retain the carcass at the spot till the panchnama is carried out. Compensation is allowed only if the animal is killed outside the forest.

In the Koyna area this means that a person has to immediately take a launch to go to Koynanagar (the launch comes only in the morning and does not operate during the rainy season), inform the forest official about the incident, then search for the talathi and bring him along with the forest guard to the precise location. The talathi is often not traceable and will not necessarily come to the spot in the remote jungle. The same is true of the forest guard. It takes at least 24 hours before this party arrives at the location. The necessary costs of bringing these persons are to be borne by the owner which also means a good deal of out of pocket expenditure. The location of the kill is often a matter of dispute as most of the time the predators drag the kill to a place of their choice, mostly inside the forest. In such a case it does not become eligible for compensation.

We were told in the concerned villages that the cost of carrying out the panchnama is around Rs 200 per incident. And the compensation (if at all one gets it) is Rs 75 for a goat. Hence, few villagers want to get into the procedural muddle. They simply dispose of the carcass and blame their fate. Of the 110-odd incidents that took place between June 1994 and May 1996, panchnamas were carried out in only four cases, that also, when a big animal was killed. Compensation was received only in one case (Rs 1,500 for a cow). In all the remaining cases, the owners spent around Rs 300 to 500 each but without result. The total cost of the animals killed in these two years would be around Rs 2,13,000 at a very conservative estimate (Rs 3,000 for a big animal, Rs 1,000 for a small animal and Rs 500 for a goat). This is the direct loss caused by the sanctuary. The loss of crops and that of the forest produce is another matter.

When living conditions became difficult, people grew restless and petitioned the SJSM to look into the matter. Initially the SJSM tried to arrange relief as in the case of the 'kolamb' grass issue. It then tried to articulate the problems and presented the same to the concerned forest officials. It also took up the matter with the local MLA and compelled him to raise this question in the state legislative assembly. Alongside, it sent petitions to the higher officials of the forest department. In order to mobilise all the people effectively, it formed a committee called 'Koyna Abhayaranya Kriti Samiti' with representation from all the six villages.

Following these demands, the divisional and regional forest officials visited the area on a number of occasions and listened to the grievances. Initially, there was no discussion about rehabilitation. In fact, SJSM was of the opinion that people need not leave the place but try to get their grievances sorted out. It was believed that displacement of this kind would not be beneficial. Instead, appropriate public works could be planned so as to make the best use of the surrounding resources. At that time, people were divided on the issue. Some favoured resettlement whereas others wanted to stay on. However, as the problem deepened and the very survival was threatened, they unanimously began to

Table 2

(In rupees)

Loss/Damage	Maximum Amount of Compensation
Cattle/buffalo	3,000
Goat/sheep	750
Human life	20,000
Human disability	6,000

demand resettlement and rehabilitation. SJSM had to bow before the wishes of the people.

Then onwards efforts were made in that direction. It included petitioning to the forest department, raising the issue in the state assembly, involving people's representatives like the MLAs and MPs and launching a persistent campaign. Fortunately, the forest department appreciated the problems caused by the sanctuary and was open to discussion and negotiation. The idea of rehabilitation was favoured by the department. The people wanted to move out of the sanctuary but not out of the Koyna region. Hence, an idea of exchanging forest lands elsewhere in the district with the sanctuary lands was mooted by the department. This proposition was accepted by the people and it was subsequently followed up. The local officials provided excellent co-operation. The people approved eight locations within the district and the department was asked to forward the proposal for further action. The matter has been pending at this stage.

Though the need for resettlement and rehabilitation has become apparent, there are certain issues that need to be sorted out before this process could be set into motion. First, though the department has approved the resettlement in principle, there has not been any formal commitment. People have received notices after the declaration of the sanctuary but no further action has been taken. On the other hand, the necessary establishment for the sanctuary is being set up. It is not yet clear whether the forest department would carry out the resettlement or the people would be treated under the Maharashtra Project Displaced Persons Rehabilitation Act 1976 (amended in 1986). This act is fairly comprehensive and guarantees a number of benefits to the project affected persons. The question is whether this would be a simple resettlement (on the principle of land for land) or rehabilitation in the true sense of the term. The pertinent questions are: What would be the basis of rehabilitation? How would be the property compensated? What facilities would be provided at the new site? What kind of rehabilitation package would be offered? And so on.

The second problem is the Indian Forest Act (1980), according to which the rights of transferring the forest land to non-forest use are vested with the central government. Thus, the permission of the central government would be required to transfer the forest lands in the district to the names of the sanctuary-affected people. This is bound to be a time-consuming process unless the forest department acts promptly. The third problem is the valuation of the respective lands. Private lands in the sanctuary are much sought after by the forest department as it would create a contiguous, uninterrupted belt. From the point of view of forests these are excellent lands but their market value would be very small. On the other hand, the forest lands near the cities would have higher market value. The sanctuary affected people might lose in the bargain.

The fourth problem is that, excepting Dicholi, all the other villages are dam-affected villages whose rehabilitation has not been completed yet. A few years ago, the state government released surplus lands in the Ujani Command area in Solapur district for resettlement. Some people have accepted these lands but have not yet shifted to the new localities. Would they be eligible for rehabilitation under the present package? In what way would their rights be reconciled? What about the people who do not stay in the catchment area but continue to hold land there? These questions also need to be clarified. Besides these there are a number of small and technical problems but which could be sorted out once a basis of rehabilitation is determined.

The Koyna case is significant for a variety of reasons. In the first place, there is the contradiction between wildlife conservation and human rights protection. The conflict is inevitable because people have been staying there for generations. There is a clear clash of interests between people's livelihoods and environmental ideals.

One approach of solving the conflict is joint protected area management. This approach is considered as one of the most reasonable ways of attaining both the objectives of wildlife conservation and continuation of people's rights [Kothari et al 1996]. Needless to emphasise, this option is ideal wherever suitable opportunities exist as it avoids undue and unwarranted confrontation between the state and the people. In some areas, however, this would be difficult due to peculiar geographic, historical and socio-economic conditions. The Koyna area is a case in point. The geographic location of the sanctuary is the main impediment. Had the sanctuary been located on a plain area, the approach of joint protected area management would have been relevant. The sanctuary is created against the backdrop of submergence and displacement. People's perception and aspirations have become different as they have suffered enormously in the past 35 years. The geographic, ecological and social situation is such that either wildlife can survive or the people. Forcible coexistence would be detrimental to both.

The villagers in the sanctuary area are demanding rehabilitation. This is some-

what unusual in today's situation where a case is often made against any kind of displacement and subsequent rehabilitation. Why are they keen on moving out of the area? A number of interesting factors are responsible. People have begun to feel that if they continue to live in the area, then their very survival is threatened. They cannot continue with their traditional lifestyle of pastoralism and shifting cultivation nor can they shift to conventional agriculture. The sanctuary has foreclosed these options nor can they cope with the wild animals. Secondly, it has been realised that the catchment area would always remain isolated due to its peculiar geographic situation and there would be serious structural limitations to its growth and development. The implication of this is that basic civil amenities would never become available and integration with the mainstream society would be near impossible.

Thirdly, the development aspirations of the villagers have increased. The younger generation does not want to live in the remote and inaccessible mountains. Nor are they interested in pursuing a primitive lifestyle which does not guarantee even the basic minimum subsistence. Like their counterparts in rural area they want to be educated, live in cities, pursue a new occupation and share the prosperity of modern life. They have realised that their rising expectations cannot be met by staying in the catchment area. Fourthly, there is a strong feeling among the people that they have made a great mistake in not moving out of the area when it was submerged. The socio-economic condition of those who moved out has improved considerably. This sense of deprivation and the feeling of 'left behind' has compelled the people to think differently. They feel that this time they do not want to miss the bus.

There is also a notion among the enlightened section of the villagers that if they continue to live in the mountains then their society will continue to follow age old superstitions, blind faith and evil practices. The condition of women, for instance, cannot be improved. The community will continue to live in a stagnant, parochial and constricted manner.

The broader question that emerges from this case is what is going to be our perspective for the development of communities living in remote and inaccessible areas. What are these communities to do when unforeseen and irreversible changes are brought about in their eco-system? Are they supposed to have aspirations and ideas as the rest of the society? Can a shepherd boy/girl hope to become a veterinarian? Should he/she dream of going to Harvard or Cambridge? Or should they stay on where they are, fully knowing that basic amenities like roads, schools, electricity and dispensaries cannot be provided. Are they supposed to have a choice about how they would like to develop their communities and themselves?

Unfortunately, these questions are not addressed by the discourse on conservation and social ecology. The issue of people's aspirations is totally bypassed by the conservationists, ecologists, foresters, bureaucrats and human rights protagonists when they prescribe approaches and solutions. Naturalists and social scientists are also blind to it. The famous study on dhanagar gavlis by Gadgil and Malhotra (1982) does not even bother to inquire into the literacy status of the dhanagars which is an essential parameter of change and development. It does not mention the stagnancy of their social organisation (especially their blind faith and superstitions) caused by ecological isolation. Another issue is what is going to be the perspective towards the protected areas? Are they expected to become true sanctuaries of the endangered flora and fauna or interactive habitats of humans and animals. If humans are allowed, then at what level of technological development should they remain? What kind of social and political organisation should they have? What limits of consumption and growth should they observe?

In protected areas where wildlife and human interests are pitted against each other, the contradictions have assumed violent forms. So far this has not been the case in the Koyna area. Here an attempt is being made to settle the dispute in a constructive manner. Though the local people have suffered considerable hardships they have not taken any measures harmful to wildlife. To a great extent the credit goes to the maturity and understanding exhibited by the SJSM. As mentioned by Rangrajan, the constructive groups (like this one) have a very critical role to play as "their strength lies in their ability to evolve creative solutions to existing problems that not only improve livelihood but also increase the elbow room of disadvantaged groups in their struggles" (1996:2406).

The World Bank has been assisting the Maharashtra Forestry Project in which the management of protected areas is a key feature. A separate Settlement and Planning Cell has been created in the office of the chief wildlife warden. This cell is responsible for helping to find solutions to questions regarding whether to resettle people living within protected area (PA) boundaries and how to accomplish such resettlement practically and within Bank and government norms. The idea of resettlement was suggested by the forest department and hence they should follow it up. The present case provides a rare opportunity to the World Bank and the forest department to implement the rhetoric of satisfactory rehabilitation with assistance from a voluntary agency. The ministry of environment and forests also has a scheme for assisting voluntary resettlement of people. Unfortunately, the state forest departments have not made use of the scheme.

The issue of conservation of wildlife and protection of human interests needs to be considered in totality and judged upon the individual merits of the case. Instead of taking predetermined positions, it is necessary to understand the ground reality from the viewpoint of the affected people. The present case shows that the real life situation is a complex one. Though the objective of wildlife protection is a laudable one, it cannot be accomplished by sacrificing human interests. Environmental conservation needs to go hand in hand with social justice. In situations where these interests conflict with one another, appropriate solutions need to be put forward without delay. Otherwise, neither of the objectives will be achieved.

Pattern of Utilisation of Health Services

Policy Implications

C A K Yesudian

There are a number of misconceptions about the utilisation patterns of health care among the poor. This has led to the formulation of inappropriate urban health services especially targeting the poor. A survey of utilisation patterns of health services among the poor in two areas in Mumbai provides some insights which may be useful for policy formulation.

IN order to have public health/medical facilities in urban areas that are responsive to the poor, one has to have a broad and meaningful cultural context of the poor, their epidemiology, their tastes, and how they live. Certain stereotyped ideas of the poor often mislead the policy-makers into taking inappropriate decisions. These ideas include the belief that the poor have a uniform socio-economic level and that they mainly suffer from communicable diseases and malnutrition. Other ideas about the urban poor are that they do not perceive their health needs properly. Therefore special programmes for them, like the health post programme, must be specially planned and target them specifically. Another misconception is that the poor fully depend on public sector health services alone and hence this sector should be expanded. Health services planned and based on such misconceptions often fail to serve the real demands of the urban poor.

The lifestyle of the urban poor could be as complex as the lifestyle of the urban non-poor. Their health problems too can be varied and the poor often do understand their health needs very well. Given their socio-economic conditions, the poor also take rational decisions to utilise not only the public sector health services but also other health care resources available in urban areas. They may have different reasons to use different sources of health services. For example, the poor may utilise the health services despite their poor quality for an acute illness because of economic reasons.

This paper attempts to shed some light on these problems by examining through the survey results, two distinct poor areas of Mumbai. The survey intends to look into the health policy implications from the community's perspective, which is neglected in urban health policy-making process. The purpose of the survey is to determine how the demand for public health services was either met or not met by the existing types, kinds and locations of services. Consequently, utilisation patterns within and between the two areas are compared as are explanations for their similarities and differences. Suggestions for policy-makers follow.

The population of Mumbai in 1991 was 10 million. As estimated 45 per cent of Mumbai's population live in slums or slum-like areas. The Municipal Corporation of Greater Mumbai is the major public sector health service provider in Mumbai. It has a wide network of health services which includes teaching hospitals, general hospitals, special hospitals, maternity homes, dispensaries and health posts. These health services are mainly intended to serve the poor.

The poor of Mumbai live in specific geographical areas in different parts of the city, mostly in environments with poor housing and poor environmental sanitation. While most of the poor areas in the central part of the city are congested and located in small areas, in the suburbs and extended suburbs, clusters of huts can be seen in vast open land with few basic amenities. Often they are in undeveloped marshy land. The size of slums varies from half a million population in a slum like Dharavi to a few thousand living in some of the new slum areas.

Two contrasting study areas were selected to highlight the differences in the utilisation pattern of health services among the urban poor. The study areas, Naigam and Deonar were selected based on their differing living conditions and the availability of health services. While Naigaum is a highly congested slum in the central part of the city, Deonar is a suburban sprawling slum surrounded by marshy land. In Naigam, housing and basic amenities are planned, though they are old, whereas in Deonar, the area was never developed for human living and there is very little basic amenities like water supply and sanitation facilities. In terms of health services, Naigaum is situated in an area where almost all the major public sector health care facilities are located, which includes the city's biggest teaching hospital, biggest maternity hospital, biggest children's hospital and the nation's premier cancer institute apart from a social insurance hospital, municipal maternity hospital, dispensary and a health post. On the other hand, Deonar has only a few health care facilities. Even the maternity home, dispensary and health posts are situated 2 to 3 km away from the study area. Thus Naigaum and Deonar present a contrasting picture in terms of their physical location, development of the area and the availability of public sector health services.

A structured interview schedule was used to collect data from both the survey areas. The interview schedule was divided into different sections which included demographic, socio-economic, housing and basic amenities sections and a detailed section on the utilisation of health services. This main section was further divided into utilisation of health services for minor illnesses, acute illnesses and chronic illnesses as well as maternal and child health services and family planning services. The final section of the interview schedule emphasised the extent of utilisation of municipal health services as well as the reasons for the utilisation/non-utilisation of municipal health services.

Different recall periods were used for different illnesses. For minor illnesses, the recall period was one year. In the case of multiple minor illnesses in a household within a period of one year, the last illness was considered for the study. Current chronic illnesses were taken for the study. In less than 1 per cent of the households, there were two persons suffering from chronic illnesses and information regarding both cases was collected. Acute illness was defined as those illness conditions which called for hospitalisation. This excluded hospitalisation meant for child delivery. The recall period for acute illness was one year. In the case of multiple acute illnesses in a year in a single household, the last illness was recorded. Information regarding maternal health services was collected for the last child delivery, if it had happened within the last five years. Immunisation data for children under five years were collected. Family planning

utilisation data were collected for married persons in their reproductive age group of 14 to 44 years. In the case of minor illnesses, a little over 5 per cent of the patients had changed the source of treatment. Only 3 per cent of chronic illness patients had changed the source of treatment. The study recorded the details of the last source of treatment only.

It should be mentioned here that the illnesses were not identified objectively by a medical professional. They were the subjective perception of the respondents. Therefore broad categories were used rather than specific illness categories. Stomach illness included diarrhoea and dysentery. Respiratory illnesses identified were tuberculosis, asthma, etc, and fevers included cold and fever, influenza, enteric fever, etc. All the surgical procedures were clubbed together. A majority of the surgical procedures were meant for removing appendicitis and hernia and procedures related to fractures.

The data collection work was carried out in the year 1987. A 10 per cent sample was selected for the survey. In the absence of any reliable data base to select a sample, it was decided to interview every 10th household starting from the left hand corner of the slum as far as possible, though it was difficult to follow the order in certain areas as the houses were not in a line. If the 10th household was closed or refused to respond, then the 11th household was requested to respond. On the whole, there were very few replacements of the selected sample households. The interviews were conducted by trained interviewers. The respondents were either male or the female adult member of the household, a majority of whom were female members.

Differential Lifestyles

This section of the paper analyses data to show that the urban poor within the city have different lifestyles. Demographic, economic and social variables were analysed for this purpose. The total sample population of Naigaum was 4,624 persons, whereas the total sample population of Deonar was 3,730 persons. The average household size of Naigaum was 5.6 and that of Deonar was 5.4. Deonar had slightly higher proportion of children (43 per cent) in households than the Naigaum households (38 per cent). The age structure, sex-ratio and marital status did not vary between the two communities. Other variables discussed here are presented in Table 1. Both the communities (Naigum and Deonar) differed in their social composition. Deonar was more heterogeneous than Naigaum in terms of caste, religion and mothertongue. Naigaum had fewer migrants and most of them had stayed in Mumbai for a longer period. On the other hand Deonar had more recently settled migrants.

In Naigaum there were fewer illiterates and more higher educated persons as compared to Deonar. Naigaum residents were slightly better off in their economic status. Housing and basic amenities like water supply and drainage were far superior in Naigaum. In Deonar, people lived in huts using the few public stand posts for water. There was no closed drainage in Deonar. Though both were poor communities, the quality of life seemed to be superior in Naigaum which had higher economic status, better housing facilities and public amenities than Deonar. The Naigaum community was more homogeneous, and had also been settled in the area for a longer period.

Morbidity: Deonar households reported fewer illnesses than Naigaum households: while 63.4 per cent of the Naigaum households reported more than 15 episodes in one year, only 49.9 per cent of the Deonar households reported more than 15 illness episodes in the same period. Detailed analysis of morbidity data are presented in Table 2. All categories of illness were found more or less in equal proportion in Naigaum and Deonar. However, within each category illnesses varied between the two communities. For example, Deonar had higher proportion of stomach ailment in the minor and acute illness categories. In the chronic illness category, heart diseases and diabetes were found to be in higher proportion in Naigaum. On the other hand, the main chronic illness of Deonar was respiratory diseases. There was a large proportion of physical handicap due to polio in Deonar. On the whole, the illness pattern of Deonar was typical of a poor community, suffering from preventable diseases. on the other hand, epidemiological transition is quite vivid when we look at the chronic illnesses prevalent in Naigaum.

Mortality: The analysis of data on mortality (Table 3) shows strikingly significant variation between Naigaum and Deonar. Though the proportion of deaths to total deaths in one year did not vary much between the two communities, the distribution of deaths by age showed significant differences. Half of those who died in Deonar in the previous year were children up to the age of five years. The situation was just the opposite in Naigaum where a little over half of the dead persons in the same period were old people above the age of 60 years.

Table 1*: Socio-Economic Characteristics

(Per cent)

Socio-Economic Characteristics	Naigaum	Deonar
Caste and religion		
Scheduled or low castes and Buddhists	27 2	37.9
Upper castes and non-Hindus	64.3	52.0
Mother tongue		
Marathi	76 2	62.9
Hindi	5.5	18.1
Urdu	9.2	11.8
Migration		
Total migrants	65.8	78.2
Lengths of Stay in Bombay		
20 years and above	48.2	42.9
Area of Migration		
Urban	7.2	15.7
Rural	92.8	84.3
Educational status		
Illiterates	26.2	40.9
Higher secondary and above	22.8	11.3
Per capita monthly income		
Less than Rs 100	3.3	4.0
Rs 100 - Rs 199	24.3	33.8
Rs 200 - Rs 299	33.6	32.4
Rs 300 and above	38.8	29.8
Housing		
Type of housing		
Pucca house (concrete building)	70.8	8.4
Kutcha house (hut)	19.6	78.6
Water supply		
Private tap	25.1	0.7
Common tap for the building	44.9	9.4
Public stand-post	28.8	66.4
Type of drainage		
Open drainage	29.7	92.5
Closed drainage	70.2	2 0

Notes: * Figures are given in precentages only for the major categories of the variable. Hence, the percentages will not add up to one hundred.
Approximately Rs 30 = US $ 1

Table 2*: Morbidity and Disability

(Per cent)

Morbidity and Disability	Naigaum	Deonar
Minor illness		
Households suffered	96.6	99.1
Fever	75.2	65.9
Stomach ailments	5.7	14.6
Acute illness (Hospitalisation)		
Households suffered	25.8	29.3
Surgery	13.9	13.0
Stomach ailments	21.2	30 8
Fever	7.2	13.9
Chronic illness		
Households suffered	6 5	5 8
Respiratory diseases	43.5	71.2
Heart diseases	32.3	15.5
Diabetes	21.0	8.9
Disability		
Households suffered	1.7	2.7
Disabled leg	35.8	15.5
Polio related disability	21.4	63.1
Paralysis	21.4	0.0

Note: * Figures are given in precentages only for the major categories of the variable. Hence, the percentages will not add up to one hundred.

Causes of death too varied between the two communities. In Naigaum the major killers were heart diseases and old age problems meaning degenerative chronic diseases affecting old people. On the other hand, preventable diseases or conditions like stomach ailments, fevers and accidents were the major causes of deaths in Deonar.

The data analysed so far showed clearly that there were qualitative differences in the morbidity and mortality patterns of the two communities. Deonar mainly depicts a typical poor community, wherein communicable diseases are still the main causes of deaths, disabilities, and hospitalisation. But Naigaum presents a very different picture. There seems to be an epidemiological transition taking place in Naigaum, though the present study did not look at this aspect over a period of time to observe the change. The mortality and morbidity patterns show a trend towards diseases like heart diseases and diabetes.

Health Services Utilisation

Table 4 gives details of various sources of health services utilised for different kinds of illnesses and health needs. The data were compared between Naigaum and Deonar. The following findings can be inferred from the table. (a) Though Naigaum and Deonar differed in their socio-economic characteristics, morbidity and mortality patterns and the availability of health services, they used almost similar health services for various categories of illnesses and health needs. (b) For minor illnesses, a large majority of the households both in Naigaum and Deonar used private sector health services. (c) For chronic illnesses, the largest proportion of the patients from Naigaum and Deonar went to the private sector for treatment. (d) For acute illnesses requiring hospitalisation, a majority of the cases in Naigaum and Deonar used public sector hospitals because indoor facilities of the private sector are very expensive. (e) A good majority of pregnant women from Naigaum and Deonar went to public sector health care facilities for maternal care which included ante-natal care, child delivery and post-natal care. (f) Immunisation and family planning programmes being government programmes, a majority from both Naigaum and Deonar used public sector health services.

Extensive use of the private sector indicates that the urban poor too spend substantial amounts on medical care. Table 5 gives details of the medical expenditure incurred by both the communities during the last one year. The Naigaum community had spent more than the Deonar community during the previous year. Though more free/nominally priced municipal health services were available to the Naigaum community, they had spent more money for health services. On the whole, both the communities had some capacity to pay for health services.

Table 4 shows that the municipal health services were used by the households of Naigaum and Deonar for different categories of illnesses. The overall utilisation of the municipal health services based on the recall of respondents for the previous one year revealed that a majority of both the communities had gone to municipal facilities for one purpose or other. However, a larger proportion of the Deonar community (68.8 per cent) had used municipal health services, as compared to the Naigaum community (56.3 per cent), though the municipal health services were more abundant in Naigaum.

Table 3*: Mortality

(Per cent)

Mortality Pattern	Nigaon	Deonar
Age at Death		
Children (0-5 years)	6.9	50.0
Elderly (Above 60 years)	55.2	15.4
Major Causes of Death		
Stomach ailments	7.6	14.0
Heart diseases	19.7	10.5
Accidents	4.5	14 0
Fevers	3.0	14.0
Respiratory diseases	12.1	10.5
Old age	25.9	8.8

Note: * Figures are given in precentages only for the major categories of the variable. Hence, the percentages will not add up to one hundred

Table 5: Medical Expenditure During One Year

(Per cent)

Medical Expenditure	Naigaum	Deonar
Less than Rs 100	8.2	16.0
Rs 100 - Rs 299	22.6	26.9
Rs 300 - Rs 499	30.9	24.9
Rs 500 - Rs 999	21.8	18.2
Rs 1,000 and above	16.5	14 0
Total	100.0	100.0

Note: Approximately Rs 30 = US $ 1.

Notes: @ Home delivery; # Voluntary sector.

Tables 6, 7 and 8 discuss the nature and reasons for using or not using the municipal health services. The findings are summarised as: (a) The higher levels of municipal health services were better utilised than the lower level services, because higher levels were perceived to provide better quality of health services in terms of good humanpower and better supply of drugs and materials (Table 6). (b) Free/nominal cost of health services in the municipal facilities was the most important reason for both the communities to use the municipal health services (Table 7). (c) Barriers to the use of municipal health services included inconvenient timings of the out-patient department for the Naigaum community and the long distance to reach the municipal facilities in the case of the Deonar community (Table 8).

The above analyses of utilisation of health services revealed that differential utilisation pattern of health services did not take place, even though there are differential socio-economic conditions, differential morbidity and mortality patterns and differential availability of health services in the two communities Secondly, even if health services are made available at a nominal cost at the nearest locality of the patients, effective utilisation of this health services would not take place.

This study observed that the utilisation pattern of health services is a product of not only the cost of service and proximity but it also involves the convenience of timing of delivery of the health service and the perception of the quality of health services delivered Proximity and convenience of timing of services are indirect economic factors. Longer distance in the case of the Deonar community prevented people using health services because it involved travel cost. Similarly inconvenient timing of health services delivery often leads to the loss of a day's wage. Hence people prefer to utilise those services, which are delivered at times convenient to them. About the quality of health services, generally people perceived early cure, good supply of drugs, personalised services, good doctor and good nursing care as indicators of good quality health care

Therefore, these four factors, i e. cost of services proximity, convenience of timing and perceived quality of health services influenced the utilisation pattern of health services. Ideally speaking, health services perceived as good quality delivered freely in a nearby place at convenient times would be well utilised by the communities in Naigaum and Deonar. But in reality, different factors influenced the use of health services for different categories of health problems. Hence, the poor too adopted different strategies and used different sources of health services for different categories of health problems. Understanding this complex utilisation pattern of health services is important for the policy-makers.

Some of the findings need to be analysed and elaborated for the purpose of making policy recommendations. The following policy issues are raised from the survey findings: (a) Misuse and overuse of higher level of municipal health services. (b) Poor quality and underutilisation of health services at lower levels (dispensary) of municipal health services. (c) Accessibility issue in terms of long distance, long waiting time and inconvenient timings. (d) Role of private sector health services in slums.

Though the municipal corporation has a wide network of health services at all levels, there is crowding at the higher levels, especially at the teaching hospital level. The municipal corporation has not so far thought about a good referral system to avoid minor illness cases thus, crowding teaching hospitals. Further, most of the dispensaries are manned by young generalists, without adequate drugs and diagnostic services. Therefore, people do not perceive dispensaries as delivering good quality health services.

It was found that there were different kinds of accessibility issues in the two communities. Long distance was a major problem of accessibility in Deonar. This issue is more linked to the distribution of health care facilities. Since Mumbai expanded to adjacent areas rapidly, the newly added areas like Deonar lacked proper health care facilities. Health care facilities are mainly concentrated at the centre of the city. Therefore, the location of health care facilities is another policy issue that needs to be addressed.

All the municipal health care out-patient facilities except maternity homes operate in the morning. Since people have to go for work in the morning, the timing is not convenient. Hence operating clinics in the evening will be most convenient for the urban poor. However, such a move can encounter opposition from the providers, especially doctors, many of whom practice outside illegally in the evening. Therefore, any change in out-patient timings should take into account the problems or resistance such a change will bring.

The waiting time is another deterrent to utilise municipal health services. In Mumbai, the out-patient departments are overcrowded in teaching hospitals. But many of these cases can be treated at the lower levels. Yesudian's study (1979) in a major teaching hospital which is close to the Naigaum community revealed that a majority of those who attended the medical out-patient department suffered from stomach ailments, mainly diarrhoea or fevers. It was observed by the researcher and confirmed by some of the municipal doctors that lower level facilities especially dispensaries in some parts of the city treated only a few patients every day. Therefore, any policy recommendation should address the issue of congestion at the tertiary level and under-utilisation at the dispensary level.

The study clearly brought out that the poor preferred the private sector health services as against the public sector municipal health services. They perceived that the quality of the private sector as being better than that provided in the public sector. The validity of this perception is questioned by many people mainly socially

TABLE 6 EXTENT OF UTILISATION OF DIFFERENT LEVELS OF MUNICIPAL HEALTH SERVICES

(Per cent)

Level of Municipal Health Services	Naigaum	Deonar
Teaching hospital	31 9	7 6

conscious doctors, lawyers and social workers in the city. Most of the private clinics in slums are run by unqualified medical practitioners. The clinics are also situated in an unhygienic environment with very limited facilities.

Since the municipal corporation has a wide network of health services at different levels, a good referral system needs to be developed to make the services meaningful and appropriate for the urban poor. Such a referral system should have disincentives such as paying higher charges for unnecessarily using higher levels of health services. At the same time, lower levels such as dispensary services need to be reviewed and strengthened. It is time for the municipal corporation to review the extent of utilisation of its dispensaries by the urban poor and to close down those dispensaries, which are under utilised by the poor. This will reduce the wastage of the municipal resources. Resources so saved must be invested on the remaining dispensaries to develop and strengthen their facilities. This quality improvement and quantity reduction process would help the poor to a great extent.

There is scope for charging the patients for the services, at least for the drugs, if the poor perceive the services as good and start using municipal dispensaries. The collected revenue should be used for the same dispensary to replenish drugs, so that there is no short supply of drugs at any time. This would increase the utilisation of the municipal dispensary to a great extent and at the same time, assure good quality health care for the urban poor for minor ailments.

Urban health policy should address the issue of timings of the municipal health care facilities. Out-patient services need to be organised during the evenings for the convenience of the community. The municipal corporation is already running the out-patient services of the maternity homes in the afternoon for the convenience of women: this has been well utilised. Apart from the convenience of timing, efforts should be made to cut the long waiting time in the out-patient department. All the sections related to the out-patient services like the pharmacy, dressing-room, X-ray facility and laboratory should be as close as possible to one another, so that patients can utilise them within the shortest time.

The study showed that the poor were not confident of the quality of services delivered by the municipal corporation. This negative perception is mainly due to the way health services are delivered in the municipal facilities. In a large health set-up like the municipal corporation, there is a need for professionally trained managers to run health services. Health care planning should be decentralised at the municipal ward level and hospitals need development of good management systems to run different services efficiently and effectively. Urban health policy should address the development of management teams in municipal hospitals by training personnel in hospital management and making them responsible for developing good management systems. The management team should also be sensitive to the perceptions of the poor and break the barriers of accessibility, so that the well managed and good quality of health services delivered by the municipal corporation are also accessible to the urban poor. There is a need to develop a proper licensing and monitoring system for private practitioners, so that the welfare of the urban poor is safeguarded. The current Mumbai Nursing Home Registration Act (1949) is outdated and was never implemented. There is a need to replace this outdated act with a new legislation which should take care of the prevailing private medical practice, especially in slums. The act should prescribe proper norms for the location and space for running clinics and nursing homes. It should also specify the equipment and other facilities that a nursing home or a clinic should have. If these aspects are taken care of, the poor will be assured of some quality of health care even from a semi-qualified medical personnel. The new act should also restrict semi-qualified personnel from treating only illnesses of minor nature. At the same time, they should be required to undergo continuing medical education programmes to update their knowledge to treat minor illnesses. They should also be required to keep proper patient records for inspection. These provisions should be preconditions for renewing the licence of clinics. Such a provision is necessary keeping in mind that it is not possible to abolish the medical practice of these semi-qualified doctors in slums.

Urban health policy for the poor cannot ignore either the public sector or the private sector. Both the sectors have definite roles in providing health services for the poor. In the case of the public sector, formulating a good referral system, relocating service facilities, strengthening dispensaries and streamlining the management of service delivery are the major policy concerns. On the other hand, the poor are already expensively utilising the private sector, whose quality of health services is questionable. Therefore, the need arises to regulate the private sector. Strengthening of public sector will also alert the private sector to provide better quality of health services for the poor. Therefore, an urban health policy for the poor will aim at stronger public sector health services and a regulated private sector health services.

Vol XXXIV No 6 February 6, 1999

Marxism and International Law

The period since the second world war has witnessed an exponential growth of international law. No longer confined to questions of war and peace or diplomacy, international law has come to, on the one hand, govern the use of oceans and outer space and, on the other, regulate core aspects of national economic, social and cultural life. Recent years in particular have seen the adoption of a network of laws seeking to establish the legal and institutional framework favourable to the accumulation of capital in the era of globalisation. But despite the critical role it has come to play in building and sustaining the contemporary international system, international law represents a wasteland insofar as Marxism is concerned. 337

Outsourcing in Indian Manufacturing

In the context of the Indian industrial sector's transition to greater market orientation, an interesting question is how firm management strategies have responded to evolving product and factor market changes. Use of outsourcing reflects the effort on the part of large firms to gain new margins of flexibility in increasingly competitive markets. An attempt to estimate production subcontracting in Indian manufacturing industries. 363

How Good Are Our Industrial Statistics?

How reliable are some of our widely used industrial statistics as indicators of manufacturing output and investment? Do they accurately reflect the underlying trends, given that the production and organisational structures are becoming increasingly complex? 350

Conversion, Reconversion and the State

The events in the Dangs of last December were a continuation of ongoing processes and tendencies: The dominant section of the majority community, the regional media, many non-government organisations and the state have either joined hands against the minorities and the oppressed or have preferred to remain silent. 312

Decentralised Health Services

The introduction of user fees and devolution of responsibilities to lower levels of government have been the two major reforms affecting rural health services. Review of initiatives to decentralise several World Bank-assisted projects in population, health and nutrition with the focus on the problems which may arise in the effective implementation of the policy. 356

Cost-Benefit of the Bomb

How are social choices made on the nuclear issue? What is the information base on the costs and benefits of generating the capabilities that are termed 'nuclear deterrence'? 327

Failed Solutions

Even after the creation of seven states to satisfy the ethnic aspirations of the local people, the north-east continues to be in turmoil. Though the existing states have failed to meet the basic needs of the people, further balkanisation is being demanded. Clearly, it is necessary to look for fresh approaches and policies. 320

Multiple Oppression

The Convention against Untouchability and Dalit Women's Oppression in Delhi in last December brought to the fore the need to look at different forms of exploitation and then to link them up to devise a workable emancipatory strategy. What also became obvious is the disjuncture between the more *avant garde* practices of the social sciences and the grim political reality that awaits transformation. 323

Manipulated Media

Media manipulation yields distorted pictures of disasters and conflicts. In fact, the worst tragedies are often the least reported. 319

Havana versus Davos

Two major world economic conferences on the ambiguous theme of globalisation took place at about the same time: the first, in Havana, by the Association of Economists of Latin America and the Caribbean and the second by the world's biggest capitalists and their political hangers-on in the Swiss Alpine resort of Davos. That however was where the similarity ended. 325

Remembering *The EW*

REMEMBERING these 50 years of *The EW* and *EPW* brings back a host of memories of events and episodes, trials and tribulations, hopes and fears through which the journal has been baked into its present shape and stature. Threats of demise have been almost regular and the journal used to live by the day, shall I say, by the week with different types of uncertainties looming large all the way, till the Trust was formed and some semblance of management was brought into play rather late in the day. The memories are naturally personal. My memories are both sweet and sour, sort of a mix of moods and manoeuvres. Incidentally, I happen to have been a regular reader of the journal right from the first issue upon which I chanced at the bookstall of M/S Mantu Ram at Dharamtala tram terminus. Since then I have remained an addict and a witness to the up and down, zigzag rigmarole that had been *The EW* and now *EPW*.

I endorse every word of what Ashok Mitra has narrated in his piece 'Fifty Years Ago' (January 9). I used to know intimately Sushil Ghose who struggled very hard to make his weekly stories authentic and would discuss very seriously some burning topic of the day at a book shop at the Grand Hotel Arcade. Shyam Babu harboured such gossip with a fervour putting in a comment or two about some new books brought in by him. *The EW* thus had a span of warmth not restricted to economists or socialists. A K Das Gupta and Dhurjati Prasad Mukerji were institutions, teachers with a mission. Ashok Mitra was himself a worthy successor to the idealists who took to the teaching profession with a religious zeal, of course sans fanaticism. I remember the debates in the pages of *The EW* and *EPW*, no discussant ever giving way to an opponent without solid argument. The wrapping up of the debate on farm size and productivity or for that matter modes of production are cases in point.

Even now, under the stewardship of Krishna Raj, *EPW* is studiedly off-beat but never sidetracking a serious point to reckon with. Many new features have since been added but the old flavour continues to create a taste of serious, rigorous analysis co-existing with the lighter, journalistic presentations. Often people would compare *EPW* with *The Economist*, London. Readers of both the journals will have appreciated that *The Economist* has become faceless and its accounts have underlined falling storage value, unlike what happens with *EPW* whose articles would call for what may be termed as rumination. When somebody sharply reacted to the obituary notice written by Andre Beteille on S C Dube, responses were immediate from K N Raj and M N Srinivas. Andre once mentioned to me that Dube was far ahead in the field and the data thrown by him were both authentic and serious. The unseemly reactions were unwarranted. But *EPW* did provide a forum to all!

The sensitivity of the readers of different hues has kept the aura of *EPW* alive. When economics was less mathematicised, controversies and wordy logic often reached high levels of sophistication. While *The Economist* revelled in giving more and more of more and more in snippets, *EPW* was been serving more and more of less and less. Yet some of the most remarkable pieces of analyses in different fields of economics have appeared in *EPW* which could as well have appeared in any foreign journal of repute.

George Rosen's letter in the same issue is much like him and his articles in *EPW*. His *Investment in Size, Capacity and Expansion* was a treat and naturally widely read, albeit the difficulties in accepting his contentions here and there. He scored high on 'readability scores' and his isoquants were keenly read and assessed with respect to industries not covered by him. There are several other names that come to mind who provided the aroma that is *EPW* despite its rather poor get up, paper quality and absence of cover gloss. Readers look for content and I am sure that they get this to their heart's content, whether you bark up the wrong tree or indulge in intellectual rowdyism.

Calcutta

Savarkar Memorial

SUKLA SEN et al (December 26, 1998) are mixing up issues in refusing to co-operate with the efforts to glorify Savarkar. They should understand that the mayor of Marseilles has given consent to the erection of a memorial in memory of Savarkar at a place close to the Old Port Area to commemorate the heroic effort at that time.

Savarkar escaped from British custody by jumping through a toilet window of the steamship 'Moria' on July 8, 1910 when he was being brought to India from Britain to face treason charges for waging war against the crown. All Indians should remember that the memorial is being erected in Marseilles to commemorate the heroic effort of escape made by Savarkar and certainly not for his ideology of Hindutva, which came much later. This is also accepted by Sukla Sen et al.

Sukla Sen et al in their letter of November 24, 1998 to the mayor of Marseilles say, "the nationalist ideology of Savarkar during this period is reflected in his book, *The First Indian War of Independence, 1857*, where he interpreted the 1857-1858 rebellion against British Rule in India from an Indian nationalist perspective. And as a result of his militant anti-imperialist activities had to suffer deportation to and detention in the remote and dreaded Andaman Islands...".

If at all, critics of Savarkar can oppose the erection of a memorial in India that may be associated with Hindutva, but certainly not the one being erected at Marseilles to commemorate the brave act of an Indian fighting the imperialists.

Towards a Consensus, Slowly

ALTHOUGH the eighth round of talks between the US deputy secretary of state and India's external affairs minister Jaswant Singh has not brought the hope for reversal of US sanctions, that there is a smoothening of the way is obvious. For as much as India and Pakistan for that matter, want the lifting of sanctions, it is as important to the US in the long-run that the opportunity to control critical technological developments gathering pace in these countries is not allowed to slip away. Moreover, restoring normal relations with India is closely connected to the Clinton administration's eagerness to move ahead with the CTBT and have it ratified by the US Senate. In any case, the US cannot escape acknowledging India as a new member of the nuclear club, however reluctantly. Just as the imposing of sanctions was the expected response to India and Pakistan putting on display their nuclear capability, it is now necessary for the US to lift the sanctions and especially its objections to the transactions of multilateral agencies. But timing is everything – for the leverage afforded by the imposing of sanctions in extracting some gains from the two countries may dissipate soon enough.

The most visible point of maximum gain for the US is September, when the CTBT entry into force provision meeting is held, before which the Clinton administration hopes to get the Senate to ratify the CTBT. Persuading India and Pakistan to sign the CTBT would strengthen the US government's case in the Senate. At the end of the latest meeting between Singh and Talbott in January, the official statement was about "tangible visible movement" towards the lifting of sanctions in anticipation of India taking some specific steps on CTBT. The Vajpayee government is, however, caught in a bind of its own making after the bravado in the aftermath of Pokhran. It is imperative that a political consensus is obtained in parliament. The irony is that although no party has held out any specific objection to India becoming a signatory to the CTBT, none is willing to support the Vajpayee government's decision to do so. The fact that Talbott's visit to Sonia Gandhi was no courtesy call – he was accompanied by the full seven-member delegation – is indicative of the US' keenness to ensure a consensus on the issue so that there are no hitches and glitches in the future. Equally, it is aware of the difficulties at the political level for the Indian government to agree to sign the CTBT with any degree of certitude.

This means that there is much to be gained on both sides if the US were to appear to soften its stand on the sanctions before any visible movement by the Indian government on the CTBT. And there are several indications that this is what is under way now. The US has not put up any objection to India's application for a loan from the International Finance Corporation, the private lending arm of the World Bank for a coal mining project in south India. This is being seen as a first step. The test case will be the one billion dollar World Bank loan for the power sector in Andhra Pradesh. The US is reported to be talking to the other G-8 countries to formulate an approach to facilitate the granting of that loan. In any case, having allowed the IMF to go ahead with its programme in Pakistan it would be difficult for the US to sustain its objections to the Indian requests. The World Bank is due to take up India's case for a $ 125 million loan soon and it is likely that the US stand will not be as rigid as it was in May last year.

The US is clearly not unappreciative of the nature of the moves being made by India and Pakistan to resume discussions at the highest levels. This is something that the US delegation had 'suggested'. It is also considered significant that the delegation spent only 24 hours in Islamabad while holding talks with several leaders over four days in New Delhi, indicating that the deal is being worked out with the two countries quite independently, although Islamabad is being kept informed of the results of the engagement here. It would seem likely then that the stage is being set for the two countries to come to a co-ordinated decision on the signing of the CTBT, 'independently' of US involvement.

There are other indications as well of the thawing of the US position. The Indian chief of army staff General V P Malik has been invited to attend the ceremony of the change of guards of the US Pacific Command in Hawaii later this month signalling, observers believe, a reversal of the US approach after last May when all senior level military contacts with India and Pakistan were suspended. The US also appears to be making efforts to engineer a rapprochement in India-Japan relations as well, with a senior member of the Talbott team visiting Japan specifically to inform it of the outcome of the meetings on the subcontinent. Also, the US and India are planning discussions on the resumption of bilateral defence co-operation covering training programmes as well as transfer of technology. While there are no definite moves towards a review of the 'black-listing' select Indian companies by the US, this is an issue of relatively low sensitivity and is expected to be resolved in due time.

There are, as is to be expected of course, apprehensions on what kind of promises the Indian government has made, apart from on the CTBT issue, in return for the lifting of the US sanctions. While these will inform political debate in parliament and outside, circumstances being what they are, the Vajpayee

government has few offerings to make to the US. For one, the government in Delhi is skating on thin ice all the time keeping its different constituents in good humour and can hardly afford to take many significant unilateral initiatives; for another, the signing of the CTBT would necessarily have to be a consensus decision, which would make it difficult for any formation in office, even a single-party government, to make private deals of the kind made in the heydays of Congress power. In sum, if India does sign the CTBT, as it seems likely to do together with Pakistan, it would probably be politically among the most unassailable decisions in international relations made by this country.

BIHAR

Fratricidal Politics

A correspondent writes:

THE massacre of 23 dalits in Shakarbigaha village in Jehanabad in Bihar by the Ranvir Sena on republic day should be an eye-opener to the various Marxist-Leninist groups who are operating there. The impunity with which the Sena had been carrying out one carnage after another during the last four years since its birth – the biggest being in Bathani Tola in 1996 and Lakshmanpur-Bathe in 1997 (not to speak of a dozen other lesser killings in the strongholds of the Marxist-Leninists in Bihar) – has been made possible by the fact that the naxalite groups are more involved in fighting among themselves than in launching a united offensive against the Sena goons.

There are mainly three Marxist-Leninist groups working in Bihar – the CPI(ML) Liberation group, the Maoist Communist Centre (MCC) and the CPI(ML) People's War group. The latter came into being following the merger of the old People's War group and the Party Unity group in August last year. Earlier attempts to bring in the MCC in the united fold failed. As a result, during the last four years, the Bihar countryside has seen intermittent clashes between the MCC and the People's War group. According to the newly formed CPI(ML) People's War group, the MCC had killed 84 of their supporters and leaders. In retaliation, the former had killed 45 MCC supporters. The MCC has not spared the Liberation group either. In September 1997, MCC guerillas ambushed and killed a dozen Liberation group activists in a village in Bihar. In January this year two of their activists in Ranchi were reportedly killed by the MCC. All these naxalite groups allege that the MCC is being aided by Laloo Yadav's ruling Rashtriya Janata Dal.

Whether the allegation is true or not, the fact remains that the internecine fights among these naxalite groups have come as a gift from heaven to the state administration in Bihar. All through the 1980s, the police were totally helpless in the face of the rising popularity of the naxalite groups among the rural poor in the Bhojpur-Gaya-Aurangabad belt who under their leadership were mobilising and resisting the vested feudal interests. The private armies of the landlords, like Bhumi Sena, Lorik Sena, Sunlight Sena, etc, had to beat a hasty retreat in the face of the armed offensive of the naxalite groups. With the beginning of the 1990s, however, when Laloo Yadav came to power in Bihar, the Marxist-Leninist groups began to face problems from a number of directions. Firstly, Laloo Yadav succeeded in driving a caste-based wedge among the followers of the Liberation group, with a number of their Yadav supporters and activists shifting allegiance to Laloo. The large middle-peasant component of the naxalite base was thus fragmented. Secondly, the Liberation group, which was the largest naxalite organisation in the state, decided in the early 1990s to slow down on armed action and lay more emphasis on parliamentary struggles and mass movements in order to expand its base. As it came out into the open, the only underground armed groups left in the scene were the MCC, the Party Unity and the People's War groups (the latter two now merged into one). They became increasingly hostile to the Liberation group, accusing it of revisionism and attacking its cadres, thus unleashing a bloody fratricidal conflict. While the virtual withdrawal of the Liberation group guerilla squads did indeed contribute to some extent to the blunting of the edge of the naxalite armed offensive, it cannot be denied that it still remains one of the largest Marxist-Leninist groups with numerous mass organisations and a vast following among the rural poor. By belittling this and treating the Liberation group as an enemy, the MCC and the CPI(ML) People's War groups have ignored the ground reality and created fissures in the Marxist-Leninist movement.

This suicidal politics of division has now come home to roost. Taking advantage of it, the landed interests of Bihar have rallied their forces with renewed vigour. In 1994, they formed the Ranvir Sena, which, with the direct backing of the BJP and tacit support from Laloo Yadav and the state administration, launched armed attacks on the poor peasant followers of the naxalite groups. Under public pressure, the government was forced to ban the Sena after it massacred dalits in Sarathua in Bhojpur in July 1995. Although the ban continues, it has not deterred the Sena from carrying out massacres. According to the Liberation group, the Ranvir Sena gangsters have so far killed 270 people in 20 major massacres and 91 clashes. The naxalite groups have hardly been able to resist this offensive of the Sena, and till today, according to their own claims, they have succeeded in meting out retribution in a few cases only, in spite of pledges to avenge the massacres.

It is thus evident that during the 1990s while the naxalites have wasted their fire-power on internecine clashes and have become increasingly fragmented, their opponents among the rural feudal forces have become more consolidated and have succeeded in weakening the naxalite base through terror tactics. One of the major reasons for the clashes among the naxalite groups is not so much ideological difference as competition for space in the narrow base in which they remain confined in Bihar. In spite of three decades of activities, none of the groups has been able to expand their base beyond the Bhojpur-Gaya-Aurangabad belt and a few pockets in Palamau. The groups operate in these areas and contest with each other in carving out their separate zones of influence. Each tries to jealously protect its own zone and fiercely resists any infiltration by the other group. Instead of undertaking the more challenging task of moving out to the hitherto untapped areas of the Bihar countryside, they try to vie with each other in expanding their zones of influence within the same old narrow base.

It is not only in Bihar that such clashes are taking place among Marxist-Leninist groups over spheres of influence. In Andhra Pradesh, the People's War group is locked in a bloody conflict with the CPI(ML) led by Chandra Pulla Reddy's followers, who have a substantial base in certain parts of Telengana. Here again, these two groups remain confined to a few zones, where they compete with each other to gain influence. If the Marxist-Leninist groups are seriously interested in a revolutionary transformation of Indian society, one wonders why instead of proliferating in one single area these groups do not send

their trained activists to propagate their messages and build up movements in other parts of the vast Indian countryside, the major chunk of which still remains outside any communist influence worth the name. India provides enough space to enable them to try out their respective tactics and prove their validity.

COMMUNAL VIOLENCE

Kid-Glove Treatment

WHILE the Sangh parivar's vindictive campaign against the Christian minorities and the BJP-led centre's acquiescence in it have indeed led to the escalation of attacks on that community in different parts of the country, the non-BJP-run state governments cannot wash their hands off and escape the responsibility for allowing such happenings in their states.

Orissa, where the latest incident of the horrendous killing of an Australian missionary and his two children took place, is run by the Congress. In the Left Front-run state of Kerala, three Christian students were recently attacked by RSS and VHP supporters. Bihar, ruled by Laloo Yadav's Rashtriya Janata Dal, had seen frequent attacks on Christian missionaries and churches all through the 1990s. In 1994, two Christian priests were murdered in Gumla district in south Bihar. Clearly, the saffron brigade's anti-Christian atrocities are no longer confined to the BJP strongholds like Gujarat and UP (where in Allahabad, four Christian missionaries were recently attacked with iron rods by Bajrang Dal activists). Self-proclaimed secular political parties which are running state governments should seriously ponder over this, and ask themselves why they are failing to protect the religious minorities in their states.

The unrestricted spread of the outfits of the Sangh parivar (VHP, Bajrang Dal, Hindu Jagran Manch, etc) in hitherto communally unaffected parts of the country may have less to do with any spontaneous mass support for these aggressive proponents of hindutva, and more with sheer administrative failure to curb their criminal and violent activities, and political failure to ideologically defeat their campaign. The violence of these RSS activists could have been nipped in the bud long ago in places like Orissa, Kerala or Bihar if the local administration there had taken firm steps at the right time to arrest the miscreants who had been spewing venom against religious minorities and stop them from organising 'shakhas' and similar other nefarious activities. In Orissa, for instance, both the local police and the intelligence department now admit that the main culprit, allegedly a Bajrang Dal activist, was a history-sheeter who was booked for dacoities and murder, and had been campaigning for quite some time against Christian missionaries and their tribal followers, and organising non-Christian villagers to strike against them. There was nothing secret about his activities. Yet, why did not the police arrest him? In Kerala again, the VHP had been for quite some time continuously spreading a vituperative campaign against the Evangelical Church of India on the issue of conversion. Yet the administration apparently took no notice of the explosive implications of such a campaign. The indifference of the police encouraged the VHP goons to physically assault the member of the Evangelical Church. The clamping of prohibitory orders and arrest of several RSS activists were a rather belated response, after the damage had already been done.

The failure – or unwillingness – of the state administration to curb such crimes is nowhere more evident than in Bihar, where not only Christians from the tribal communities, but also dalits from the downtrodden castes are victims of unabated violence of the upper caste religious fanatics and landlords. The latest massacre of scheduled caste villagers in Jehanabad in Bihar by the landlord-led Ranvir Sena, adds yet another chapter to the long history of such carnages in that state. It can no longer be attributed to the oft-repeated innocuous excuse of 'failure of intelligence', since the Ranvir Sena landlords had been openly threatening the scheduled caste villagers under the nose of the police. It is clear that while claiming to be the messiah of the poor, Laloo Yadav at the same time protects the upper caste landlords and the state administration acquiesces in their crimes.

This kid-glove treatment of Hindu upper caste criminal politicians, even by political parties which claim to be secular, indicates a certain tendency of subservience to the religion of the majority in general, and the caste-based hierarchical system of that religion in particular. It is this attitude which had blunted the political campaign against the hindutva that is propounded by the Sangh parivar. The extent to which this infirmity has affected even the Left was evident recently from the deliberations of the 16th Congress of the CPI(M) held in Calcutta in October last year. Reports from different state units revealed that many party members in Bihar followed "various obscurantist practices" and that in places like Tamil Nadu, Orissa and UP, caste discriminatory practices against scheduled castes, like not allowing them to draw water from common wells, drink from common glasses in tea-shops, take out wedding or burial processions through main roads, continue even in "areas where the party and the mass organisation influence exists, but the party does not take the initiative to campaign against it".

It is this lack of ideological initiative on the part of the Left and secular parties that has led to a situation where the masses are either apathetic to, or connive at, the vitriolic campaign and physical violence launched by Sangh parivar against religious minorities like Muslims and Christians, and dalits who convert to these religions. The abetting of the administration in such crimes even in states ruled by the Left and secular parties further indicates how these parties in power all these years had allowed the forces of hindutva to infiltrate into the crucial segments of the bureaucracy and police.

CURRENT STATISTICS

EPW Research Foundation

The WPI has fallen from 359.4 on October 31 to 353.9 on January 23, the steepest decline being in food articles from 470.8 to 439.7 or by 6.6 per cent. As a result, the annual rate of rise in the WPI has come down from 8.5 per cent to 4.7 per cent and in food articles from 23.4 per cent to 7.8 per cent. Reflecting the recession in the real sectors, there is no significant pick-up in non-food bank credit (even taking into account banks' commercial investments), though M_3 growth has accelerated.

Conversion, Reconversion and the State

Recent Events in the Dangs

Ghanshyam Shah

The events in the Dangs in the last week of December last year were a continuation of the ongoing persecution of Christians in Gujarat. The dominant section of the majority community, the regional media, many non-government organisations and the state have either joined hands against the minorities and the oppressed or have preferred to remain silent.

I

CHRISTIANS constitute less than 1 per cent of Gujarat's population. They are scattered thoughout the state. The majority of them belong to the traditionally lower socio-economic stratum of society. Not only Christian missionaries and their institutions but poor Christians, particularly dalits and adivasis, are under attack and have been systematically harassed by Hindu fundamentalists under BJP rule. The state machinery is more or less in collusion with or indifferent to the miscreants. The Gujarat government has not only ignored the recommendations of the Minorities Commission but also questioned its need to visit the state. The prime minister has given a clean chit to the state government and said that the chief minister was not at fault and had taken action to prevent atrocities against Christians in the state. VHP leaders have openly said that the Gujarat government is carrying out their agenda. The Sangh parivar, including BJP ministers and other office-bearers, allege that 'people' in Gujarat are getting converted to Christianity, either forcibly or with all kinds of allurements. There is a conspiracy to create a Nagaland or Mizoram in Gujarat with a majority Christian population. The events in the Dangs, in the last week of December, are in continuation of the ongoing persecution of Christians. The dominant section of the majority community, the regional media, many non-government organisations and the state have either joined hands or preferred to maintain silence, against the minorities and the oppressed, as if the state and civil society have blended together.

The Dangs literally means 'forests' and is a land of tall trees, thick scab jungle and dense vegetation over some 1,764 sq km. It is the smallest district of Gujarat with a population of 1,44,091. There are 309 villages and two small towns – Ahwa, the district headquarters, and Waghai. More than 70 per cent of the villages have populations of less than 500. Ninety-four per cent of the inhabitants are adivasis. The non-adivasis have settled here during the last 50 years for business or white-collar employment. Kunbis or kukanas (40 per cent), bhils (33 per cent) and varlis (14 per cent) are the major tribal groups. Kukanas are believed to have migrated from Kokan. They are better off than the bhils. Though kukanas accept bhils as the rulers, the rivalry between the two continues in one or another form. The Dangis in general and the bhils in particular are known for their militancy. They had vigorously rebelled several times against the British administration. The bhil chiefs remained unconquered by any outside power till the mid-19th century. The British administration did not interfere in the social and economic life of the natives. The bhil chiefs were recognised as the rajas of different tracts and the Britishers took monopoly rights over timber. The Dangs was maintained as an excluded area.

For the Dangis, forest and land are commonly-shared resources. There was no personal ownership of land till independence. Shifting cultivation, hunting and collection of forest products were their sources of livelihood. They used to change their place of residence frequently for one or another reason. The British acquired lease of forests by hook or by crook from the bhil rajas in 1842. The government exploited the forest for revenue and commercial purposes. The rights of the adivasis on the use of forests had been slowly reduced. Shifting cultivation was restricted. In the process, the owners of the forests were considered as encroachers. The same policy has been continued after independence. Shifting cultivation has been banned and the rights to the use of forest products have been reduced considerably.

The Dangs is classified into three areas: reserved forest, protected forest and unclassified forest. The area under each category has not remained constant. In fact, the area under unclassified forest, which the tribals could use for cultivation, has declined over a period of time. For instance, under the Surat Circle the unclassified forests had declined from 2,218 sq km to a mere 621 sq km, whereas the area under reserved forests had increased from 2,977 sq km to 4,318 sq km between 1961 and 1971. "In the late 19th century about 66 per cent of the Dangs was classed as available for cultivation. By 1956-57 the figure had fallen to about 54 per cent. During the 1960s, the Gujarat government carried out a survey of the Dangs with the aim of giving land occupancy deeds to the cultivators. As a result of this survey, 79,913 hectares was classed as farmland, which represented 45 per cent of the total area" [Hardiman 1994]. By 1989-90 farmland had been further reduced to 61,400 hectares, that is 36 per cent of the area. Nearly 53 per cent of the area of the Dangs has been declared by the government as forest and the forest department has complete control over it. Nineteen per cent of the land is not available for cultivation [GOG 1996]. More than half is under 'reserved' forest which the local population is not only prohibited to cultivate land but from where they are also not allowed to use any forest product. In several cases (according to one report, as many as 110 villages) dwellings have been forcibly shifted from the area. According to a survey in 1968-69, from 79,409 hectares cultivated by the adivasis, the forest department acquired 21,154 hectares by using all kinds of means for forest plantation. In 1970, the government ordered transfer of 56,214 hectares for agriculture. But in reality only 15,617 hectares were allocated to 17,638 adivasi cultivators. According to official records, only 30 per cent of adivasi households have been registered as legal cultivators. Under the protected forests the department carries out plantation work, sometimes on the agricultural land of adivasis by removing their standing crops. This is being done even by violating a Gujarat High Court order of 1993. When the adivasi cultivators quote the order, the forest officers tell them to throw away the court order.[1] Adivasis are frequently harassed and beaten up by the forest department under one pretext or another. The terror of the forest department scares the inhabitants. Forest labour has been their

major source of livelihood. Till the mid-eighties, the forest department used to open jungle coupes for felling, logging and carting of wood. The location of the coupes was spread over the whole of the area so that practically every village had easy access to the place of work [Parikh 1961: 338]. Gandhians have organised forest labour co-operative societies (FLCS) since 1949 to eliminate timber merchants and contractors. There were 45 FLCS run by Gandhians and political leaders in the mid-eighties, providing seasonal employment to more than 5,000 persons. FLCS were hotbeds of faction-fights and corruption. A handful of local political leaders have amassed wealth and developed a vested interest in perpetuating the terror of the forest department. However, the FLCS provided slightly higher wages than the contractors [Joshi 1992]. The number of jungle coupes has declined sharply since 1986 with the new forest policy. Now only two or three coupes are opened every year for cutting dry trees. Except for plantation work, practically all forest labour has been discontinued. Consequently, the Dangis are forced to migrate outside the district for labour. It is estimated that more than 40 per cent of the Dangis migrate after monsoon for six months to work in sugar cane farms in neighbouring Surat and Valsad districts. There the conditions of work are wretched and wages are low.

The Dangis were almost illiterate on the eve of independence. There was only one school started by the British Political Agent for bhil rajas and nayaks. It had only 11 students in 1947-48. Christian missionaries began to work here in the early 19th century to spread the message of the gospel. Some efforts were made by them in the 1940s to start teaching Dangi boys. Gandhian constructive workers settled in Ahwa, the headquarters of the Dangs in 1948. They established Swaraj Ashram as the centre of their activities revolving around khadi and education. First of all they established Ashram Shala, a residential school. Later, the government of Bombay introduced the system of Ashram Shalas in 1953, following the Gandhian model which encouraged voluntary organisations with recurring and non-recurring 100 per cent grant. For Gandhians, the objectives of the Ashram Shalas were not only to teach the three R's but also to teach a 'better way of living'. According to them, tribals were 'backward' in their customs, not cleaning their teeth, not taking bath everyday, wearing only a 'langoti', i e, loin-cloth, and believing in ghosts and many superstitions. Gandhians emphasise vegetarianism and, teetotalism and are anti-superstitious, and support observance of certain festivals observed by upper caste Hindus, fasting on certain days and cleanliness not only in a hygienic sense but also with an element of purity. Amritlal Thakkar, known as Thakkar Bapa, was the first to start an Asharm Shala for adivasis in the Panchmahals district. He noted in his diary in 1922, "Bhil children were admitted after bath and dressed in new clothes, putting 'chanlo' (red mark) on forehead and eating 'gor dhana' (jaggery and coriander seeds)" [Shah 1955: 148]. Such customs are usually practised by upper caste Hindus. In the early fifties there was competition between Gujarati and Maharashtrian Congress Sarvodaya workers to start Ashram Shalas as a device to create patronage networks. Later, after the formation of Gujarat with the Dangs, competition for opening Asharm Shalas intensified among the various factions of the Congress. Over a period of time these Ashram Shalas have stagnated and are in a shambles [Joshi 1980].

With state support, the Swaraj Ashram and Marathi-speaking Gandhian workers started 179 primary schools between 1949 and 1955. The primary schools run by the Gandhians and Christian missionaries with their own resources were taken over by the state. The number of primary schools had increased to 378 by the early nineties. There was only one high school in the district in 1961. In 1975 the district panchayat of the Dangs controlled by the anti-Swaraj Ashram faction invited two Jesuits to start high schools in the Dangs. The secondary schools have increased from eight in 1980 to 21 in 1990. Of them three are run by Christians; four are government schools and the rest are Ashram Shalas or schools run by various Gandhian and non-Gandhian organisations. Deep Darshan and Nava Jyot schools are run by Christian organisations. More than 90 per cent of the students (out of a total of 1,100) studying in these schools are non-Christian adivasis. These schools attract more students as their teaching is considered better than that of the others. Their performance in the Secondary School Examination (SSC) is strikingly better than that of all the other schools. On an average the Dangs had 36 per cent result in the SSC between 1988 and 1997, whereas the Deep Darshan school had 93 per cent. And that is the reason these schools are a sore point for those who have been running schools in the district for many years.

With the rise in number of secondary schools, the number of students has also increased three times during the last decade. The district now has a college also. In 1969 there were four Dangi graduates, their number is now more than 1,200. Among the tribal talukas of Gujarat, the Dangs has the fastest growth in literacy, though the literacy rate is lower than the state average which is 61 per cent. The rate is 48 per cent as against 36 per cent among all STs in Gujarat

At the same time, the Dangs has the highest rate of educated unemployment among all the tribal talukas and districts. A number of graduate and postgraduate Dangis are forced to earn their livelihood through manual labour in and outside the district. The district does not have many white-collar jobs. And as the Dangis are late-comers in the field of education educated persons of other adivasi groups continue to dominate. In 1970 a graduate Dangi told me, " A real test of life is to find a job. Our illiterate and ignorant relatives think that after having studied this much (a college degree) one gets employment immediately. But that is a wonder of the world! Interview calls are only a formality. We waste money for going and coming, but there is nobody to come to our rescue..." [Shah 1972]. The situation is now worse. The number of such frustrated youth has increased. Educated Dangis formed the Dangs Yuvak Seva Samiti in 1968 to get justice for the local youth. Their demand was that white-collar jobs in the district should be reserved for local Dangis. They were demanding an autonomous status for the Dangs. As unemployment among educated Dangis has increased sharply during the last two decades and as the forest resource-base has been shrinking, frustration among the youth is mounting and is getting ventilated in different forms.

Several secular NGOs working in neighbouring areas have extended their activities in the Dangs since the mid-seventies. A few local NGOs have also come up. They have taken several income-generating programmes such as milk co-operative societies, poultry, sewing, bamboo work, furniture work, etc. But none of them has so far provided viable supplementary income to a sizeable number of people. The only advantage of these NGOs is that they provide employment to a handful of educated Dangis.

Socio-economic transformation in the Dangs, thanks to overall capitalist development and particularly the forest and tribal development policies, has adversely affected the local population. As the adivasis lost their land to the forest department and experienced harassment, sporadic confrontation between the Dangis and the forest or revenue department increased. There were several struggles in the late seventies demanding the right of cultivation of the land they used to traditionally

cultivate. In 1977 a memorandum was submitted demanding: (a) resurvey of the district and allocation of land to the adivasis, (b) ownership of trees to the cultivator adivasis where the trees are located in land possessed by them, (c) closure of nurseries and plantations set up by the forest department on land cultivated by the trbials, and (d) more facilities to the Dangis for education, health and agriculture. Several demonstrations, meetings and processions were organised to press these demands. All methods – repression, intimidation and co-option – were used to diffuse the struggles.

Once again in the mid-eighties the Dangis formed the Adivasi Bhumihin Kisan Hakka Sanrakshan Samiti (BKSS) for asserting their rights over land and forests. Like in the seventies demonstrations, rallies, dharnas, meetings, etc, were organised. This was a more militant struggle than the earlier one and adivasis of several villages collectively had taken away 'forest' land and started cultivation, resulted in direct confrontation with the government. The government used force and removed the crops. Several adivasis were arrested. An adivasis of Mahal village said, "when we demand land they do not give and when we take land they shoot us. How do we survive?" Besides repeating the demands of 1977, the BKSS demanded that (1) all those adivasis from 110 old villages who had been forced by the forest department to evacuate, their villages should be allowed to settle in their old villages, (2) since adivasis had not been given land as per the 1970 survey, the survey of land and cultivators be carried out once again, and all those who were earlier cultivating land should be given possession of their land and all landless households be given at least five acres of land for self cultivation, (3) adivasis should be given a reasonable price for the forest products which they collected, (4) all forest labourers should be given equal and minimum wages and free labour should be stopped, and (5) harassment by forest and other government officials should be stopped immediately.

The government did not heed the demands. Instead, the leaders of the Samiti and other adivasis were beaten up severely and arrested. A few activists were killed in police firing. The main leaders were arrested under TADA and all measures were used to crush the movement. Though the organised struggle under the leadership of the BKSS has been diffused, unrest continues. Neither the Gandhians nor the Christian missionaries working in the area extended support to these struggles; nor did they protest against the brutality of the forest and police department against the adivasis. For the Hindu philanthropic organisations and fundamentalists, the economic problems of the adivasis were a non-issue. All of them looked upon the struggles of the Dangis as disruption of the peaceful life of the district.

II

According to the 1991 Census 95 per cent of the Dangis enumerated their religion as Hindus. Sample surveys carried out by social scientists do not give a significantly different picture from the census. A few who are fully committed to particular sects such as Sanatani, Mokshmarg, Swadhyay, Kabir, etc, reported their sect as their religion. The leaders of these sects and the followers called their sects as part of Hindu religion. However, Christian and some 'secular' scholars question the census operation. It is argued that adivasis are Animist and not Hindus [Raj 1994]. This is a ticklish issue, more so at this juncture when the Sangh parivar is bent upon making India a 'Hindu Rashtra'. Notwithstanding the risks, one cannot brush aside the issue.

Formulation of the questions about religion and the method of enumeration of religion have been rightly contested. The question in the census and in social science survey questionnaires generally is: "What is your 'dharma'?" The word 'dharma' as understood by the investigator is alien to the Dangi, particularly in households where formal education has not reached. Consequently, all adivasis except those who are consciously baptised into Christianity or Islam or one of the new sects of Hinduism or the tribals who consciously name their religion as 'tribal religion' [Singh 1994] are categorised as 'Hindu'. It is a categorisation more by the enumerator rather than by the adivasi respondent.

If Hinduism means the institutional four-fold-brahminical social order, the model prescribed by *Manusmruti*, accepting Vedantic philosophy, etc, the adivasis are certainly not Hindus. Though adivasis have a notion of hierarchy based on status or ranking, the Dangis have not imbibed the values related to purity and pollution as understood and practised by caste Hindus. They do not consider themselves as belonging to one of the castes among the Hindus. Nor do they perceive their present position as adivasi as the result of their deeds of their past birth. Their social organisation, norms of interpersonal relationships and many of their customs related to marriage, child birth, etc, are different in many ways from those of the caste Hindus of the adjoining areas. More important, caste Hindus do not consider adivasis as part of them. The adivasi is always looked down upon and placed outside the caste-based social order. Any effort to bring the advasis into the institutional and dominant brahminical ideological framework of Hinduism by conversion to Hinduism is only for political purposes. This process, following different trajectories, in fact has a long history. It is now considered as natural and inevitable and is being systematically and aggressively carried out with state support, but not talked about.

However, if Hinduism means plurality of religious beliefs related to god and a supernatural power, worship in different ways to multiple gods and goddesses, nature and spirits, and diverse rituals and beliefs about life and death, the overwhelming majority of the adivasis of Gujarat in general and the Dangs in particular may be called Hindus. Kukanas consider themselves 'higher' than the bhils. They do not eat beef, whereas the bhils

do. Among the Kukanas those who eat beef required purification of some kind [Parikh 1961, Engineer 1999]. Such Hinduisation or popular Hinduism, if one may call it that, has been a two-way process. Adivasis have adopted many beliefs and gods of the caste Hindus living in their vicinity, the latter also have embraced several deities of the adivasis, and in many cases both followed similar rituals and beliefs independent of each other. In some cases the caste Hindus give brahminical names and legends to the deities worshipped by the adivasis. Such a process was clearly evident in the widespread socio-religious movement launched by the adivasis of central and eastern India in the twenties to change their established ways of life. The Dangs was also affected by the movement. It was popularly called the Devi movement. The commands of the Devi, Goddess Sarabai, were to stop drinking liquor and eating meat and, take bath twice a day. This has some closeness with the tenets of the Bhakti movement. Symbols, rituals and ceremonies practised in worshipping the Devi were similar to traditional patterns of worship which had many resemblances to those of several caste Hindus of the region. The Devi asked the adivasis not to become Christians. David Hardiman observes, "The cultural side to the Devi programme laid most stress on ritual purity and non-violent behaviour. Almost nothing was said about religious beliefs and no attempt was made to demand that the adivasis worship Hindu gods such as Krishna, Rama or Hanuman. In a few cases, most notably in the Dangs, superstitious beliefs were condemned, but this did not represent an important element of the programme in most cases. The adivasis were in fact permitted by the Devi to go on worshipping their old gods and goddesses so long as they did not perform blood (violent) sacrifice. Rituals and practice had to change, but not the religion as such" (1987: 164).

Adivasis of the Dangs worship Silaiya and Simaliya Devs (deities symbolising the village boundary and hill), Mavlima (goddess mother), Kanasari Devi (grain goddess), the snake and the tiger, ghosts of ancestors, etc [Parikh 1961]. However, educated adivasis have begun to observe festivals and rituals of caste Hindus thanks to their socialisation in public institutions run by Gandhians and the government [Shah 1984].

A section of the adivasis believe that they were the original natives of the land. In the thirties a religious movement called Sati Pati Panth was launched which opposed Hinduism as well as Christianity. The leaders of the Panth consider that the present rulers are outsiders and had encroached upon the adivasis' land and forests. They do not participate in elections and do not pay revenue to the state. They follow their rituals and ceremonies which are closely related to nature. In the fifties the movement had a vast following in Surat and Bharuch districts. It launched a land-grab movement to oust non-tribal landowners. It has quite a few followers in the Dangs. There are some other organisations such as the Adivasi Vikas Parishad and Adivasi Ekta Parishad. They appeal to the adivasis to awake and get free from the clutches of the Hindus. Like the Sati Pati Panth, they also advocate that the adivasis are the original inhabitants of the country. The Adivasi Ekta Parishad emphasises their culture, related to nature, and their communal way of life. In 1997 the Parishad organised a conference near Dharampur, close to the Dangs, in which more than 10,000 adivasis from different parts of Gujarat, Maharashtra and Madhya Pradesh participated.

Nearly 20 Christian organisations of different denominations now work in the Dangs. Most of them are Protestant. They mainly cultivate relationships with the local people, listen to their woes, sympathise in their difficulties, teach morals ('do' and 'do not do') and persuade them to join for prayer. Compassion is their approach. Miracles and medicines are used to attract the adivasis to join their fold. Some of them, as a part of their welfare programmes, also provide help in the form of loans for buying seeds or levelling land. Recently some churches have appointed newly-converted youth to work as 'Rakhewal' pastors with a salary. Catholics who believe in liberation theology are engaged in social welfare programmes. Proselytisation is not a priority for them.

In 1981, 1,500 persons, both adivasi and non-adivasi, were enumerated as Christians in the district. Their number had increased to 7,500 by the 1991 Census. The majority of them are Protestant. The Church of North India has the largest following. Most of them are first generation converts. Less than 5 per cent are of second or third generation converts. There are various reasons, as given by them, for accepting Christianity. The most common reasons are curing of diseases, relief from tension related to day-to-day problems, faith in prayer which helped them in their personal crises, particularly recovery from illness. "I was sick and tried 'Bhuva-Bhagat' [traditional healers] but could not get relief. My neighbour who is a Christian suggested to me to meet the 'Padari' [priest] and ask him to offer a prayer for my recovery. I was knowing the Padari as he used to visit us. I told him about my illness. He asked me to join with him for the prayer and I began to feel better. From that day I used to attend the prayer regularly and later became 'Cristi' [Christian]." He was baptised 20 years before. Another person who has proselytised recently told me, "I wanted a male child. I tried 'Bhuva' and also observed 'vrata' [religious vows] but it did not help. I talked to the priest and thanks to his prayer now I am a father of a male child. Hence I developed faith in prayer and became, Cristi". The humane and personal touch of missionaries who expressed concern, in the adivasis' dialect, about the day-to-day problems of adivasis and were willing to help them influenced some to become Christians. After baptism they slowly give up certain rituals related to worship. They are advised to give up worship of the deities which they used to worship from their birth. Their participation in traditional religio-cultural celebrations has declined. "You cannot worship two gods. You cannot be a Hindu as well as a Muslim, can you?" a Catholic Father asked me. Lancy Lobo observes, "Protestants share some prescriptions with Hindu sects such as abstention from alcohol, smoking tobacco, etc, but they directly attack the indigenous cultural practices, such as marriage songs and rituals....Unlike Hindu sects Christianity introduces new and hitherto unknown cultural practices to the tribals" (1992: 55-56). The missionary insists that if one becomes Christian one should not worship other gods. This does create friction at village and family levels. For instance, the Dangis traditionally celebrate their festivals like Holi, Akha Tij, Tera, etc, collectively. On Akha Tij a basket of germinated seeds of different corn – nagali, warli, etc – is worshipped with 'kumkum' (red powder) and is ceremonially thrown into water. Christians have stopped contributing for and participating in the festival. Such behaviour of a few in a small village of 60 or so households isolates them and creates ripples in the social fabric. But friction on such occasions has never been so sharp a to polarise the community in a tug-of-war. After all, it has never been a monolithic religious community. It may be noted that some Christian adivasis keep photos of Jesus as well as Hanuman, some say that they are 'Hindu-Christians'. But both Hindu and Christian bigotry would force them to be either strake or.

III

In the past the adivasis were known as 'kaliparaj', i e, black-skinned people. Caste Hindus looked down upon them as backward and 'jungali', i e, uncivilised

with bad customs and manners. Gandhiji called them 'raniparaj', i e, brave people living with wild animals. Gandhians began to work among adivasis as a part of their political-cum-social reform programme to uplift them. They "disapproved of the tribal ways of life" [Chaudhuri 1975] and made efforts to bring them into the 'mainstream'. The Sangh parivar prefers to address adivasis as 'vanvasis', i e, forest-dwellers. According to them the difference between caste Hindus and vanvasis is the place of settlement, the former live in the plains and the latter in forests. They consider that vanvasis are backward Hindus who need to be reformed. As a part of their programme to reach out the vanvasis various outfits of the parivar and several sects of Hinduism carry out a number of philanthropic activities among the adivasis, including distribution of food, clothing and medicines during famines and epidemics. These programmes have been systematised and more extensively carried out during the last two decades. Charitable institutions providing health services have been started at different locations in the tribal belt. Some of the Gandhian workers are collaborating with these 'social' activities.

Congress workers continue to have a hold over educational and social welfare activities in the adivasi areas. The BJP has so far not completely succeeded in building an institutional base for distribution of patronage. Though the BJP won a majority in the state assembly elections, the Congress has still an edge over it in the tribal belt. Not only does the Congress continue to win the assembly seat from the Dangs constituency, it also captured back a few BJP seats in the 1998 assembly elections. As a part of the election campaign, a leaflet was circulated informing adivasis that Christian adivasis were not entitled to get benefits as scheduled tribes. It proclaimed: "after the election [the new government of BJP] would stop giving such rights to Christians. Realise! Realise! Purify yourself through yagna and become a Hindu. Otherwise you will regret later."

As a part of building a base among the adivasis the Sangh parivar is actively involved in welfare and religious activities in the region. The Hindu Jagran Manch (HJM) established Vanvasi Ashram, a residential school, at Waghai in 1991. Thirty male students live in the ashram. It aims at all-around development of the vanvasis. Swami Avishanandji has settled here for the last two years. One more ashram has been started in 1996 at Mokhamar village, near Subir, where the Nav Jyot school, run by Jesuits, is located. Swami Avishanandji says, "The ashram here is one of the 7,000 projects of vanvasi 'kalyan' [welfare] in the country. When I came here and talked to people they said 'give us religion. Our brother who becomes Christian is deviating from us. There are many problems here, but first make us Hindu. We want our identity.' We regret that we have not come here earlier to show our tradition and culture. People here worship Hanuman. Village people get divided as some become Christians. Those who become Christians throw away our gods into the forest which leads to tension. Such tension has increased during the last five years. Thirty per cent of the Dangis got converted to Christianity with financial temptations and force. This process has been slowed down because of our work. Now the converted are coming back [into the Hindu fold]. We take them to Unai where they take bath in hot springs and get purified."

The HJM organised a Hindu 'sammelan' (conference) in June 1998 in the Dangs in which some Christian adivasis were collectively 'purified' and taken back into the Hindu fold. On the eve of the sammelan HJM distributed a leaflet which said: "The most burning problem of the Dangs is the establishments being run by Christian missionaries...Wherever Christian priests have gone in the world, they loot the people...They teach people to tell lies, to steal in the name of religion...Awaken Hindu and struggle against these thieves who lie, who rob you of your rights, and bring these people to their senses..."

Besides 'reconverting' from Christianity to Hinduism, HJM has launched a campaign to harass and pressurise those Christians who do not follow their advice. In 1998 at least 14 incidents were reported in the press or in police records of harassment and beating. In several villages such as Jamalpada, Divan Temrun, Kudka, Darpada, Borkhal, etc, individual Christians were beaten up. In Darpada, the cycle of a Christian was snatched away. Stones were thrown during the Sunday prayers. Some prayer places – kacha buildings of bamboo and tiles (only 4 per cent of the houses in the Dangs are pucka) – were damaged. In Dhagunia village which has eight to 10 Christian households out of a total of 122 households, Christians were beaten up in November 1998. Some Christians were taken to Unai temple to be bathed in the hot springs. Those who refused to go were prohibited by the village sarpanch (headman) to take water from the village well. In Umerpada village the police inspector harassed Christians on the basis of a false complaint made by VHP workers. In Kudka village evangelist Premchand was beaten by the police patel. In early December, Dakshin Gujarat Adivasi Cristi Kalyan Parishad (DGACKP) submitted a memorandum to the chief minister giving details of the instances filed with the police. The petitioners asked: "Despite the complaints about burning of six and damage to four prayer places why is the government silent? Why is the police department not taking any action? Why has no one been arrested?" It is alleged that Christian adivasis are not given birth and tribe certificates, necessary for employment, by government officers. In that sense, the government has informally implemented what the leaflet, mentioned above, announced before the last elections.

In a few villages the Christians were persuaded and also intimidated that if they

do not go to Unai for purification, they would face social boycott. Most of those who succumbed to various pressures belong to the first generation of Christians. "We have to live in peace and harmony with our own people", one of them said. Another person from Jamanmala who was on his way to Unai told us, "I became Cristi because the Father advised me to offer prayer and God would help me for a better life. But my condition has not improved. Now Swamiji says, 'you should not forget your culture and religion; get purified'. I am now becoming Hindu so that we can continue to observe our rituals and can also drink liquor on festivals and can also use coconut in worshipping our 'devs' deities]." "I became Cristi because I thought that it would save me from disease. But now I am going to Unai because this is our bap-dada's [parental] religion". One old person said "I have come here [to the ashram] because Swamiji has called us and others from the village have come"

Last year VHP, RSS, HJM and other organisations of the parivar organised several anti-Christian rallies on Christmas day in different locations of the adivasi belt in Gujarat. One of them was at Pipalwada in Vyara taluka, bordering the Dangs. The Bajrang Dal started its activities in the Dangs in 1996. By distributing freely pictures of Hanuman it popularised Hanuman as the god of the Dangis. It recruits youth. The Dal organised December 6, 1998 as Hindu Vijay Gaurav Din, i e, Hindu victory day, at Ahwa. However, the programme did not attract many youth and passed off as a non-event.

HJM decided to organise a mass rally on Christmas day, December 25, in Ahwa. The town has more than 100 Christian families, Dangis and non-Dangis. There is a Christian locality and a church. As a part of its propaganda HJM distributed leaflets declaring: "Christian priests are insulting Hindu saints through newspapers. This insult is insult of the whole Hindu society. It is a religious duty to bring sense to those Christians who dared to insult the Hindu saints. HJM is determinant to stop the conversion activities of Christian missionaries." Another leaflet was against Ishu (Christ) and the Bible proclaiming that Ishu was not a saint and a 'dut' messenger of peace). It declared that Ishu had come on earth to divide the family and the people. He was a champion of war. The Bible asked followers to destroy the god of those who lived on the hills and to finish those people who worship gods and goddess.

Christian organisations such as the DGACKP and the Church of north India wrote to the collector and district police commissioner in early December last that they had learnt about the proposed rally and were apprehending attacks on Christians and churches on the 25th as had been attempted the previous year at Pipalwada where there was an attempt to set fire to a church. The government was requested not to give permission for holding the rally on that day. The DGACKP asked for protection to all churches. The South Gujarat Human Rights Group also requested the collector not to give permission for the rally. The collector called a meeting of representatives of various organisations on the 23rd in which the Christian organisations reiterated their demand. The collector said that there would be enough police force on that day, but he did not commit himself whether he would allow the rally to be held. He finally gave permission to the HJM for the rally. Police protection was not provided to the prayer places.

The venue of the rally was very close to the church in Ahwa. The town was decorated with saffron flags on the 24th. Several truck-loads of people from within and outside the Dangs were brought for the rally. The procession started at 12 noon. The main slogans of the rally were: "Christians are 'chor' (thieves)", "Hindu jago Christians bhago" (Hindus awake, Christians run away), "gali gali me shor hai Padari sab chor hai" (everybody in the streets is shouting that Christian priests are thieves). "Jay Ram and Bajarangbali ki jay". Some of the placards were also painted with such slogans. Christian leaders complained to the deputy police commissioner and the collector that they should not allow the shouting of such provocative and insulting slogans. At around 4 o'clock the rally was converted into the meeting in which provocative speeches against missionaries and Christian conversions were made. It was alleged that the missionaries were anti-national and had plans to convert India into a land of Christianity. For that the missionaries were getting very huge foreign funds. People were asked to protect "our tradition and Hindu religion and teach a lesson to the Christians so that they do not convert people". One of the speakers said that they did not need to fear as the governments at the centre and in the state were "ours" (of the Hindus). It is also alleged that the collector went on the dais and received garlands.

Some Christians who were standing outside the ground protested against the speeches. They appealed to the authorities again and again, without success, to prevent the speakers from making offensive speeches. It is alleged that some Christians threw stones at the meeting. The other side alleges that HJM activists threw stones at Christian women in the market. In the evening around 6 o'clock, the police used lathis and tear-gas to disperse the meeting to avoid any further confrontation. "Had there not been a lathi charge at that time, some Christians would have been killed as many of the participants in the rally were armed with stones, steel pipes, sticks, and trishuls", a police constable, a patidar by caste from central Gujarat who was on duty at that place, observed in a personal interview with this writer.

As the meeting dispersed, a crowd of 50-60 persons went to the market. The mob broke open and looted five shops. Furniture was broken. Three of the shops were of Muslims and two were of Christians. Another mob went to Deep Darshan school, about one and a half kilometre from the venue of the meeting. It was allegedly led by Janubhai Pawar, Bajrang Dal leader. Two policemen who were on duty with sticks to provide protection could not stop the crowd. Stones were thrown and window panes broken. A third mob went to Subir, which is around twenty kilometres from Ahwa, by jeep. They first threw stones at the hostel. A few persons from the crowd went inside the compound of the school and set fire to a jeep and a motorcycle. On the same night six individual Christians were beaten up in different villages. Two churches were damaged. Next day when the home minister of Gujarat camped in Ahwa, churches in three villages were set on fire. A Christian was beaten up in one village. On the 27th 10 churches in different villages were damaged or set on fire. In five days from the 25th to 29th 19 churches were reported to have been damaged and 10 Christians beaten up. Except in three or four cases, the injuries were minor. The police has arrested more than 100 persons, both Christians and non-Christians and adivasis and non adivasis, local and non-Dangis. But some Christians live in fear because they have been warned that as soon as the state reserve police is withdrawn "we will teach you lesson".

During my visits to several villages in early January I found sharp Christian-non-Christian divisions in the villages. Several non-Christian adivasis told us that the present strife had been the creation of politics. In most of the villages outsiders damaged the prayer houses. That too during the nights. In Muchond village the church was set on fire on the 27th at midnight by hooligans who came to the village from outside in a jeep. As soon as the village

inhabitants came to know of the fire they joined together to extinguish it. The initiative came from non-Christians. This is true of many villages. In a few villages Christians and non-Christians jointly repaired the damaged churches.

The BJP government in Gujarat and at the centre said repeatedly that there had been conversion by force. But so far they could not get any evidence. Concocted instances of disfiguring of Hanuman idols or throwing away of idols into forests by Christian adivasis have been widely circulated. Newspapers have published such stories without verification. The deputy chairman of the state planning board, Acharya, who is preparing a 'Hindu Economic Plan for Gujarat' had the audacity to say publicly that the destruction of churches in the Dangs was a 'reaction' of the Hindus. According to him, "It is the missionaries who started the whole thing. The Hanuman temple was attacked first, leading HJM to take out a rally on December 25 as a show of strength of the Hindu forces" [2] In response to our question "Why did you organise rally on 25th December?" Swami Avishanandji, the main organiser of the rally, said, "If conversion is their constitutional right, to organise a rally on any day is our constitutional right". The leaflets, cited above, attacking Ishu and the Bible were circulated. They bore the publishers' and printers' names. Such activities were a deliberate attempt to hurt religious feelings and contributed to creating tension in the area. But the government has not taken any action against the culprits.

IV

The Dangs is in turmoil. During the last three decades the Dangis have been pushed out of their forest-based subsistence economy. They have been forced to be settled agriculturists, but the total farm land area available to them has been considerably reduced. Whatever little agriculture land they cultivate is being increasingly encroached upon by the forest department for plantation. They are almost debarred from using major and minor forest products. The quantum of forest labour has declined significantly, forcing them to migrate outside to work on low wages and in wretched condition. Education has increased, but without non-farm job opportunities. Unemployment among the educated has increased, leading to frustration. Various welfare programmes have not taken off the ground. Restlessness among the Dangis has been manifest in various forms, resulting in several agitations. Atrocities against adivasis involving the forest and police departments have increased. Instead of solving their basic issues of survival, the present agitation focusing on Christian missionaries has been fostered from outside, diverting the prevailing tension and dividing the Dangis on religious lines which are a non-issue for the Dangis.

The events in the Dangs are a part of organised persecution of Christians in Gujarat. The additional chief secretary of home department is reported to have told district collectors in, 'high level review meeting' in November 1997 that "there is a conspiracy in tribal areas to destroy Hindu 'sanskriti' by creating class war and large-scale conversion. Tribal welfare programmes need to be geared up to counter the conspiracy." He asked the district collectors to keep a close watch on Christian missionaries and their conversion activities.[3] The anti-Christian campaign on a large scale spearheaded by VHP, HJM and Bajrang Dal followed. In 1998 a number of events took place in different parts of the state, including the burning of the *New Testament* in Rajkot, digging out of the body of a dalit Christian from the grave in Kapadwanj, attack on nuns in Panchmahals, and damaging of churches in tribal areas. The VHP and other organisations are openly involved in the anti-minority campaign. The director-general of police, C P Singh, accepted in October 1998 that "it was the activists of the Vishva Hindu Parishad and Bajarang Dal who were taking law into their own hands which posed serious danger to peace in Gujarat. Many of the attacks on the minorities were after these organisations had whipped up local passions on mere allegations of conversions [by Christian missionaries] and forced inter-religious marriages, where again conversion was supposed to be the alleged motive..."[4] But the government has not taken action against the culprits. Moreover, the Gujarat government has set up a police cell for monitoring inter-religious marriages. This announcement was made in the assembly by the home minister. Thus the state has become openly a party to the persecution of minorities.

Notes

[I thank Lancy Lobo for arranging my visit to the Dangs, Mar abhai Gaekwad for providing certain information, Gopal Guru and S K Thorat for comments on the earlier draft of the paper and my colleagues at CSMCH, JNU, for encouraging me to write this paper.]

1 In 1993, on behalf of 228 adivasis of 20 villages a special civil application was filed asking for restraint on the forest department and its employees from evicting the adivasis from the land they have been cultivating [Engineer 1999, Chaudhari 1998]. The Court issued the stay order.

Worst Tragedies, Least Reported

Bharat Dogra

Media manipulation is not a new phenomena. Many states have resorted to it over this century, making for a distorted picture of disasters and conflicts.

IT is ironical that some of the worst tragedies of the century were least reported, at least at the time that these occurred. One of the most infamous examples is that of the great Chinese famine of 1950-61. The *Third World Guide*, a widely cited reference published by Instituto del Tercer Mundo, Uruguay, says, "In 1958, Mao launched the Great Leap Forward, aimed at accelerating rural collectivisation and urban industrialisation. This heavy-handed, dogmatic and inflexible plan led the country down a disastrous path, sparking widespread famine in the countryside. Planners in the cities continued to order food to be shipped out of rural areas, assuming that peasants were understanding their production by 15 per cent, while party officials in rural areas were actually over reporting production by 15 per cent. The official Chinese figure for deaths between 1959 and 1961 is 20 million, one of the greatest human tragedies of the century, and one of the least reported." The *Human Development Report* (HDR) 1997 says that the mortality was even higher. This report says, "In 1959-62 more than 30 million people, most of them peasants, died in the Great Famine (of China)". It is perhaps not entirely unrelated that this domestic fiasco was followed by China's invasion of India in 1962.

Subsequently, the 'cultural revolution' also took a heavy toll of innocent lives in China. In the words of the *Third World Guide*: "At its worst, the Cultural Revolution degenerated into mob rule as opportunists skilled in revolutionary rhetoric settled personal scores. With the 'struggle between two lines' attaining civil war proportions at some stages in the Cultural Revolution, production suffered severely as many factories and universities closed altogether. An estimated 10 million died during the years of turmoil."

Earlier in Soviet Union, during the years of Stalin's supremacy, several hundred thousand people were killed to curb dissent in the course of arbitrary imposition of ill-advised development programmes devised by bureaucrats or armchair theorists having little contact with reality, particularly rural reality. When Stalin tried to forcibly convert Kazakh nomadic herders into collective farm ranchers in the 1930s, as many as half the population of herders are estimated to have died fighting this change.

The terrible ecological ruin of Soviet Union of course continued well beyond the years of Stalin, in fact it was probably accentuated. As Zhores A Medvedev has written in a widely quoted paper, 'The Environmental Destruction of the Soviet Union' (*The Ecologist*, 1990): "The Soviet Union has lost more pasture and agricultural land to radioactive contamination than the total acreage of cultivated land in Switzerland. More land has been flooded by hydroelectric dams than the total area of the Netherlands. More land was lost between 1960 and 1989 through salinisation, changes in the water table, and dust salt storms than the total area of cultivated land in Ireland and Belgium put together. Amidst acute food shortages, the total acreage of cultivated land has declined by one million hectares a year since 1975. The Soviet Union is losing its forests at the same rate as rainforests are disappearing in Brazil. In Uzbekistan and Moldavia, chemical poisoning with pesticides has led to such high rates of mental retardation that the educational curricula in secondary schools and universities have had to be modified and simplified."

The same expert further related how the entire tragedy had been covered up in secrecy for a long time. "Secrecy and government propaganda ensured that there was no open debate in the Soviet Union about environmental issues – and that the debate that did occur was confined to small groups of concerned individuals. Censorship prevented the general media from disclosing pollution statistics, even for non-toxic substances. Pollution caused by the military or nuclear industries was totally secret. The levels of everyday operational discharges of radionuclides from nuclear power stations were also classified. The methods of nuclear waste disposal and the location of the waste facilities were unknown. The Soviet people do not even know where their uranium mines and uranium enrichment plants are located. Food contamination by pesticides, nitrate or other chemicals remains unreported. Although government institutions exist to monitor the environment and to exercise toxicological control over food, they are subjected to official secrecy. Unofficial measurements are strictly prohibited."

However, it will be a mistake to think that such cover-ups have been confined to communist countries. In fact the most advanced western countries which take pride in the freedom of their press have also been involved in massive cover-ups of important events. Perhaps the most important cover-up related to the motives behind the nuclear bombing of Hiroshima and Nagasaki in 1945. The American establishment successfully managed the mainstream media to hide the crucial fact that the US's own top military experts had said clearly that the use of nuclear weapons was neither necessary nor justified. Before Hiroshima, general Eisenhower told Stimson, top adviser to president Truman, "Japan was already defeated and – dropping the bomb was completely unnecessary". General Douglas MacArthur told author Norman Cousins that "he saw no military justification for the dropping of the bomb". Admiral William Leahy, Truman's chief of staff said, "The Japanese were already defeated and ready to surrender... My own feeling is that in being the first to use (the atomic bomb) we adopted an ethical standard common to the barbarians of the Dark Ages."

What then was the real motive behind the use of nuclear weapons? Physician Loe Slizard, whose discovery of the chain reaction had contributed to the atomic bomb (much to his dismay) later said, he was told by secretary of state James Byrnes that he and president Truman believed that the use of the bombs on a live target were necessary to make the Russians 'more manageable' following the war. Prominent British scholar PMS Blacket has written, "The dropping of the atomic bombs was not so much the last military act of the second world war as the first major operation of the cold diplomatic war with Russia". This real motive was successfully hidden by the American government for several years.

A widely cited book co-authored by Noam Chomsky and Edward S Herman says that at the time of the Vietnam war the American media was guilty of portraying "murderous action as a defence of freedom". Other observers have pointed out that highly destructive weapons used in the more recent gulf war were later popularised as video games by media, reducing mass distress and deaths to trivia. In Nicaragua the US government wanted to overthrow the pro-democracy, pro-poor Sandinistas and the major newspapers extended full support to this idea. This reduced the entire debate to the tactics that ought to be used to throw out the Sandinistas; the view that the Sandinistas should be helped instead of being disrupted was simply ignored. According to a study released by the Centre for Public Integrity, US, "The Reagan and Bush administrations have manipulated war coverage so drastically that the American public has a distorted picture of conflicts from Grenada to the Gulf".

North-East: Crisis of Identity, Security and Underdevelopment

Jayanta Madhab

Even after the creation of seven states to satisfy the ethnic aspirations of the local people, the north-east continues to be in turmoil. Further balkanisation is being demanded which will lead to the creation of very small and totally unviable states. The existing states have failed to meet the basic needs of the people. There is growing discontent over corruption. The regional disparity between the north-east and the other states has widened as has the disparity between the rich and the poor in the north-east. Clearly, it has become necessary to reconsider the approaches and policies followed so far.

IN the 1950s, north-east essentially meant Assam, Manipur and Tripura. The colonial power introduced a number of administrative concepts like excluded areas, partially excluded areas, tribal areas, frontier tracts, north-east frontier agency, etc, to govern the hill areas of the north-east. Out of erstwhile Assam, partly to rationalise these concepts and partly to give vent to ethnic aspirations, the government of India had created four more states, namely, Nagaland (1963), Meghalaya (1972), Arunachal Pradesh and Mizoram (1987). If creation of these states would have solved the problems, nothing would have been better. But it created more problems; because, on the one hand, various smaller and bigger communities started to demand establishment of more states; on the other hand, the states showed their incapability to deliver the basic goods.

Indeed today, most parts of north-east are much more disturbed than ever before; development is stalled, bureaucracy is bloated and nothing is left for funding development, unemployment is acute; clamour for independence and creation of new states is at its peak.

It would have been simpler to describe these phenomena as a natural corollary to or a fallout from the process when a traditional society modernises. While this is partially true, the main problems lie elsewhere. The crisis is one of identity, security and underdevelopment, all interlinked.

One must realise that north-east is a mini India. There are more than 75 major population groups and subgroups, speaking approximately 400 languages and dialects, of which there are about 168 in Arunachal, 55 in Nagaland, 87 in Manipur, 100 in Tripura and 200 in Assam, Meghalaya and Mizoram. One political geographer remarked, "by virtue of its location in the transitional zone between east and south Asia, the region characteristically exhibits amalgamation of phenomena, with factors of race, language and religion. This enabled every subregion in the study area to display distinct socio-cultural and politico-economic leanings and attributes" (Gopalakrishnan, *Socio-Political Framework in North East India*, 1996, p 27). The elite of the different dominant groups having seen that neither size of population nor economic viability matters in establishing states within the Indian union and that only political pressure, violent or otherwise, is required, there is an upsurge of demand for subdividing Assam again and the potential demand for subdividing Tripura, Meghalaya and Manipur cannot be underestimated. On the one hand, the experiment with autonomous district councils or for that matter village councils in Nagaland has not, for various reasons, proved to be successful; on the other, the states have failed to deliver the basic requirements of a society. On top of this, state politicians with the help of the bureaucracy siphon off a big chunk of state financial resources, mostly coming from the centre. This comes as an incentive to the so-called elite groups for demanding new states. Creation of states not on the basis of economic viability but on political aspirations has not really helped the populace. Most of the budgetary resources are spent on salaries and to a smaller extent on debt service, leaving practically nothing for development. Income disparities have grown and regional disparities, after the introduction of the liberalisation policies, have grown even further. The north-east states have lagged behind eco..omically further and further in relation to the other states.

In addition to the demand for creation of new states, there are long pending demands backed by violent struggles in Nagaland and Assam for independence.

Looking at this kaleidoscope, one wonders why there have been such violent and vociferous demands for independence and for new states in the north-east. Indeed, no other part of India has been subjected to such a prolonged violent struggles, which have held development to ransom, as the north-east.

Behind all these demands and struggles, the overriding factor is one of identity. The fear of losing identity is paramount. This is compounded by the security factor, which is essentially protecting the land from outsiders. The latter factor was so important that as far back as 1873 the colonial power introduced the inner line regulations for most of the areas. The hill states fear that people from the plains and neighbouring countries may take their lands to set up trade, industrial projects and thus jeopardise their security and upset the demographic balance. Mizos told the then home minister S B Chavan in 1994 that "the need for tribal people is survival as tribal and development is our secondary issue". For that reason, the Mizoram government does not even levy sales tax, the most productive of state taxes. If sales tax is levied, registration certificate will have to be given to outside traders which will enable them to establish residency.

Assam did not have an inner line permit system. As a result of this and taking advantage of it, there was induced immigration and later influx from Bangladesh and Nepal. The immigration problem has overshadowed all other problems since 1979. There is no realistic estimate of immigrants, but estimate varies between 30 and 40 lakh. During 1971-91, the Muslim population grew nearly twice as much as the Hindu. The rate of growth of voters in the immigrant areas has been higher than the rate of population growth of the state. One observer reflected the sentiments of the Assamese people in 1985: "Within fifty years they will form the majority in Assam. The next step will be a referendum on merger with Bangladesh. With Assam gone India will have no land link with the rest of the north-east India" (*Assam Tribune*, August 17, 1985).

This may be imaginary and unlikely to happen, but the fear is real amongst the indigenous people of Assam. The Assam Accord of 1985, which dealt with the foreigners' issue and was supposed to identity and deport foreigners from Assam, was a total failure as far as this issue is concerned. The IM(DT) Act, which was introduced only in Assam while the rest of India follows another Act, was a non-starter. The various central and state governments including the AGP government in Assam have promised scrapping of this Act, but have done nothing in view of the governments' dependence on minority votes and on their MPs and MLAs. Therefore, no government in Assam can

afford to alienate this sizeable group. In August 1994, no sooner former chief minister Hiteswar Saikia made a statement in the Assam assembly that in a single year 30 lakh Bangladeshi infiltrators had entered Assam, the leader of the Muslim Forum threatened that unless the chief minister withdrew his statement, the Forum would pull him down in five minutes. The chief minister later said that "there is not a single foreigner in Assam". Therefore, the solution to this vexed problem becomes difficult if not impossible. In the meantime, agitation and struggle go on. Frustrated youth lose faith in the system and take up arm for independence.

An eminent historian has remarked, "a solution of the problems of foreign nationals is apparently extremely bleak. If the inflow of infiltrators remains unabated even at the present rate it will be only a question of time when the indigenous Assamese will be alien in their own home" (Borpuzari, *North East India: Problems, Policies and Prospects*, 1998, p 126).

If such be the case, clearly some re-assessment of the issue is necessary. Fourteen years have passed by and people have become disenchanted with the progress of identification and deportation of foreigners. AASU continues to agitate on the issue, submits memorandum to prime minister, home minister and chief election commissioner and observes 'Betrayal Day', etc. The Boros, on the other hand, decided to settle the issue themselves through what is called ethnic cleansing. Arunachalis, Khasis in Meghalaya, indigenous Tripuris and Mizos were not to be left behind; they also had their own scores to settle. There was a time in 1987 when there was a clamour which can still to be heard, from a section of politicians that all of north-east should have inner line regulations or Kashmir style constitutional safeguards.

While all these agitations go on, the influx is unabated and attempt to deport foreigners are stalled. The Bangladesh government is in no mood to receive such huge numbers of people and, in fact, denies emigration. The central government is equally reluctant to pursue the matter with Bangladesh. Under these circumstances some rethinking on the problem is necessary.

Among political developments, another important one needs to be mentioned. While the state legislative system is well developed, at the tertiary level of district councils, panchayats, village council, the system has not either got off the ground or not worked properly. The states are equally reluctant to share resources and functions. No elections have taken place to panchayats in Assam despite high court orders. The Shukla Commission recommended that those services which are village specific like rural water supply, elementary education, primary health, PDS, etc, should be implemented at the panchayat/district council/village council level. This will enable peoples' participation and better transparency and probably lessen corruption. But this has not happened.

On another front, arguments have been made that while the north-east has a land area of about 8 per cent, but peoples' representation in the parliament is only 4 per cent. This may not be a tenable argument. But there is an element of truth in it. Take, for instance, Mizoram; it has only one MP in the Lok Sabha. The system being what it is, he may get to speak only once in five years. This is totally unacceptable. Entire Mizoram may remain unheard. Some better methods have to be established.

Along with the issues of identity and security, underdevelopment is the third factor which has given rise to agitation and insurgency. Barring Nagaland all other insurgency movements in the north-east had their genesis in economic backwardness.

At the beginning of the planning era, the north-east economy compared well with the rest of the states. No sooner the effects of partition were felt, the economies started faltering. For, the region lost the most vital transportation routes through East Pakistan. Instead, it had to take a long, fragile and circuitous route which was costly. As a result, anything the region produced became expensive to market outside and its products became uncompetitive. The region, on the other hand, had to pay more for all the products brought from outside of the region. If there was one overriding problem, it was the connectivity problem. Unfortunately, even after 50 years of independence, it is the same. Lack of infrastructure, particularly communication, transportation and power, became critical. Together with the lack of investible capital and lack of entrepreneurship, this slowed down the pace of development. Local entrepreneurs, already small in number, could not seize the available opportunities.

Agriculture which is the mainstay and on which 70-80 per cent of the populace depend is still traditional and rice output is only one-third that of Punjab. The region is rich in horticultural products, but again the productivity is low and because of lack of market access farmers do not get remunerative prices and get discouraged. The region is blessed with water resources, yet it imports about half of its fish requirements from outside. Even worse is the case of livestock development. Assam imports 74 per cent of its milk products, 94 per cent of eggs and 98 per cent of its meat requirement. Except Manipur and Tripura, whose agricultural productivity per unit of land is higher than the all-India average, in the rest of the states in north-east agricultural productivity is a point of concern. In 1991-96 Assam's agricultural growth rate was estimated at 1.2 per cent, much below the rate of growth of population and that of Meghalaya 0.8 per cent and Tripura 0 per cent. Despite the fact that agriculture and allied sectors contribute more than 31 per cent to state GDP and has the potential to grow the state's budget allocation to this sector is meagre. Assam spends only 7 per cent out of a total Rs 6,000 crore budget on that sector. Manufacturing sector is small, never contributes more than 5-6 per cent to the state national product. Due to lack of investment, growth is stagnant. Only the service sector, i e, government, and the construction sector, due to government investment mostly on border roads in some states, are growing.

The Shukla Commission estimated that about Rs 2,500 crore worth of consumables are imported from outside the region every year. In addition, the credit-deposit ratio being very low in the region, the banking sector transfers something like Rs 5,000 crore from this region to other regions for investment. Because of prolonged insurgency in the region, despite abundance of natural resources (oil, gas, coal, granite, limestone, water and forest wealth), no outside investment has taken place. Indeed there was capital flight in the last eight years from the region. Unemployment, particularly educated unemployment, is high. All these have compounded the problem.

Looking back, the planning priorities of governments, both central and state, were faulty. The implementation of projects and programmes was even worse. Whatever public sector enterprises were established, almost all got sick due to mismanagement. Basic requirements like law and order, justice, primary education, primary health, water supply and sanitation, motorable roads and electricity could not be delivered by the states despite having received from the centre Rs 42,000 crore during the last seven years. The per capita devolution is highest in the north-east amongst the states. This is, however, not without reason. All projects in the north-east are big and lumpy. Projects can be implemented only during five months of the year due to prolonged monsoon; all

projects cost more because of transportation problem. Whatever the reasons, the common man has not been benefited by the huge development effort. Corruption, like in other states, is all pervasive. People at large in the north-east are very critical of the performance of the governments which have failed to harness the abundant natural resources of the region and exploit the potential of border trade with Myanmar and Bangladesh.

Insurgency in Nagaland is the oldest in the region, though it has been halted at various times by the signing of accords and obtaining of concessions. The more aggressive NSCN has its origin in 1975 and for the last 28 years has waged a war against the establishment. Mizos fought for nearly 20 years. ULFA, the Boros and other outfits in the north-east are comparatively new. Nagas, after half a century of instability, are clamouring for peace: a cease-fire with a section of NSCN is in place. The other section has still to make up its mind. Local people say that this has enabled the underground to come overground and collect extortion money and taxes more openly.

In any case, insurgency can survive only when the local population gives support or remains indifferent. Unless local people clearly make a choice in favour of government, insurgent outfits will survive in some form or other till the ground for insurgency are removed. Local people make the choice when they see the benefits. Unfortunately in several states on the north-east, local people are still largely indifferent, mainly because governments have miserably failed to deliver the basic necessities of life. They also see the pervasive corruption. Lately, however, both in Nagaland and in parts of Assam a realisation has come that the costs involved on both sides are tremendous and the time has come to discuss the issues.

To sum up, even after the creation of seven states to satisfy the ethnic aspirations of the local people, the region is, still in turmoil. Further balkanisation is being demanded which will lead to creation of very small and totally unviable states. The states have not been able to deliver the basic goods to their people. There is a growing discontent over the level of corruption. The regional disparity between the other states of India and the north-east has widened as also the disparity between the rich and the poor within the region. Except Mizoram and Manipur, all other states have a higher percentage of people below the poverty level than the all-India average.

Clearly, some rethinking is necessary. Existing policies have not worked; further creation of states will not guarantee the end of the problem. Independence is beyond the purview of any government to grant. What is required therefore are the following:

(1) Encourage free, frank and open debate on the issues of the north-east within and outside the region; let the population understand the issues in their perspectives and in totality.

(2) Willingness on the part of the government of India to discuss unconditionally with all major insurgent groups.

(3) Rethinking is necessary on the issue of federalism, to enable states and tertiary level institutions to participate fully in the all-round development of their constituents.

(4) Sincere efforts are required on the part of the central and state governments to strengthen the functioning of tertiary level institutions like panchayats, autonomous districts/village councils.

(5) The foreigners issue needs to be reassessed in view of the current situation. Serious efforts are needed from all quarters to solve this vexed problem which seems insolvable. Some rethinking is necessary.

(6) Identity and security which are such emotional issues in the north-east can be assured through various means which need to be explored. Land alone need not be the only means of security.

(7) Consideration for giving labour permits to Bangladeshis and Nepalese may not be ruled out once identity cards to the residents are given.

(8) The central government had commissioned various studies through committees and commissions. Two former prime ministers also announced hefty packages for the north-east. The Shukla Commission's recommendations largely remain unimplemented till date. People at the ground level do not see any difference. Indeed people have become disenchanted and cynical. Money alone will not help, unless accompanied by strict accountability. Money has come before, it may come again, but the people's lot will not improve if the same system of disbursement is followed. Radical thinking is necessary.

(9) At the same time, one cannot emphasise too much that whatever the commitments made by the central government should be honoured through a time bound plan.

(10) In a federal structure, it is the responsibility of the central government to see that regional disparity does not go beyond a point. Reasonable, not total, parity need to be maintained.

(11) Lack of appreciation and understanding of north-east in the rest of India, particularly in the power centres, has compounded problems. This needs to be removed.

There is a tendency at the centre and elsewhere to see this region as a liability. But one must recognise that the region was once prosperous and peaceful till extraneous factors, not of their making, began to hurt. Its hydropower potential, oil and gas resources, its forest wealth, if prudently used with linkages with south-east Asia can benefit the whole country. Therefore it is time to see the area as an asset rather than a liability.

Untouchability and Dalit Women's Oppression

Bela Malik

A purely dalit or a purely feminist movement cannot adequately help dalit women. But no matter. Dalit women participants at the Convention against Untouchability and Dalit Women's Oppression were willing to help themselves. Even as they narrated their problems and humiliations, there was pride in a new identity, in being able to withstand hardships, and in the strength and courage to wage attritive battles.

FIFTY years after independence ritual pollution, caste exploitation and all the other legacies of Indian civilisation that those who oppose affirmative action in the name of efficiency choose to ignore, and which those who oppose it from more prejudiced motives would like to perpetuate, are alive and well, keeping in good cheer the less polluting 'citizens' of the nation. And the images of all of these were graphically brought out at the Convention against Untouchability and Dalit Women's Oppression, organised by the All India Democratic Women's Association (AIDWA) on December 20, 1998 at Delhi. All that was recounted at the convention highlighted the need to address the specific problem of caste oppression compounding the burdens imposed by a generalised patriarchal exploitation. Thousand-odd dalit women from Punjab, Haryana, Rajasthan, Himachal Pradesh, Uttar Pradesh, Bihar and Madhya Pradesh participated in the convention, along with several guest speakers and AIDWA activists and sympathisers. The turnout of a thousand-odd was impressive.

Dalit women speakers used the forum to articulate their problems and to share the experiences of their struggles. They were from diverse backgrounds, belonged to different age groups and had varying degrees of consciousness about the gap between the reality of their socio-economic conditions and the legal rights that they notionally possess. The degree of passion expressed varied accordingly. The younger women, for instance, were more militant and less willing to tolerate the terms of their existence. The women were mainly rural, though some activists were based in urban areas. Some women were politically active and held political office at the panchayat level. Others were agricultural workers or construction labourers. Despite these differences, there were common threads running through their accounts. They narrated their experiences without hesitation, and in a wide and mutually incomprehensible variety of dialects rendering the term 'Hindi-speaking-belt' somewhat of a misnomer.

For the dalits, caste and class merge in subjecting them to the margins of India's political economy. The convention foregrounded the indignity being experienced and resisted by dalit women. Concentrated in the primary sector, only a fraction of land is owned by dalits, and holding on to land that is legally theirs more often than not involves protracted and tenacious struggle. Resorting to a mere language of rights is inadequate as a solution to the experiences of this section living away from the middle class world of rhetoric and debate.

In Haryana, for example, according to the 1991 census, only 8.06 per cent of scheduled castes own land, while 55.08 per cent are landless agricultural labourers. Land 'pattas' are never in dalit women's name. For dalits in general, access to schools and education is minimal. As an instance, in Rajasthan, only 8 per cent of dalit women are literate

While it is true that dalits in general are oppressed, dalit women bear a disproportionately higher share of this burden. Given the division of labour within the household, women have to suffer more from the lack of access to water, fuel sources, and sanitation facilities, exposing them to humiliation and violence.

Upper caste women are often among the perpetrators of oppression. In this general environment, the contexted significance of a purely dalit or, more specifically, an exclusively dalit women platform seems only natural. Given the nature of oppression, a struggle for a better life for dalit women cannot, perhaps, be divorced from a wider social emancipatory agenda. It is often the case that a purely theoretical feminist argument asserting the equality of women is not adequately sensitive to the larger context of caste and class context in which oppression and inequality of women is practised. It remains a matter of reflection that those who have been actively involved with organising women encounter difficulties that are nowhere addressed in a theoretical literature whose foundational principles are derived from a smattering of normative theories of rights, liberal political theory, an ill-formulated left politics and more recently, occasionally, even a well-intentioned doctrine of 'entitlements'.

Dalit women face discrimination in access to a dignified life, to legal redress to claim what is theirs in principle, to equal wages, to the decision-making process, and to benefits from government initiated programmes targeted at their welfare. Issues of childcare and health are relegated to the background in a struggle for subsistence. The problem of being marginalised and therefore discriminated against is worsened by the practice of untouchability. Sharecropping, for example, is not extensive among dalit families due to the observance of ritual purity by caste groups. The grim reality of untouchability appears inescapable. It is there in schools, in tea shops, while labouring, while walking on public roads. The fear of indignity, humiliation and rape is always present. For instance, speakers reported that food was thrown to them as if they were dogs. The abuses were casteist "she looks like a 'chura'". Speakers also pointed out that casteism was practised by people across religions. Caste becomes convenient in reinforcing existing inequities. Control over resources that fulfil fundamental human necessities is established unequally, in conformity with the coercive power of class. Its distribution, therefore, can only serve the ends of extended coercion.

Women participants were keenly aware that caste pollution, by either presence or touch, that operated so strongly in the case of conflict over public resources seemed not to matter at all in the extraction of labour. When it comes to taking water from a hand pump, notions of ritual purity are invoked, when it comes to the extraction of labour in the field, it does not matter at all that the seed is planted, the crop tended and the grain harvested by the same untouchable. The same applies in the case of rape as social revenge/punishment/coercion. By a curious quirk, the untouchable becomes socially touchable in more ways than one. The image of a homogeneous Hindu people in pursuit of a single civilisational dream was seen for the eyewash that it was by many speakers. Even in the case of purportedly so fundamental an aspect of life as worship, the invocation of the existence of caste to create separate places of worship was emphasised. Even in the aftermath of the

demolition of the Babri masjid, which was ostensibly the act of a united Hindu community, all temples were not open to dalits.

The speakers were aware of the work of mobilisation by the hindutva brigade in their midst. A strong sense of the limiting practice of untouchability was manifest. This consciousness raised some broader self-evident questions. Once this awareness exists, what is the mode of politics that becomes necessary? Secondly, what are the implications for a sociological analysis of Indian society insofar as a transformative knowledge or a transformative self-realisation exists? Some sociological and anthropological, and from it, uncritically imitative historical writing pursuing knowledge from the perspective of identity, seems to evade altogether the transformative possibilities presented by such consciousness.

Be that as it may, this experience was common to the urban and rural parts of north India. While a comprehensive legislation, the Scheduled Caste and Scheduled Tribe (Prevention of) Atrocities Act, 1989, exists on paper, social, political and economic pressures ensure that it remains ineffective. Of the innumerable cases of rape of dalit women, only a fraction of the victims lodge reports, an even smaller fraction is filed by the police, while actual conviction is negligible. The problem lies not so much with the law itself as with the context in which it exists.

The gravest problem is that of both an absolute and relative scarcity of drinking water. At common water sources, dalit women face humiliation, and are even deprived of water because upper castes assert their privilege in respect of drawing water. Unequal relations are compounded from the lack of equality in access to resources. The inequality is reproduced when, in exchange for permission to draw water from a public source, dalit women are forced to perform various menial tasks for upper caste women. The everyday act of collecting water invites many abuses and jibes. Many speakers complained of how they were made to beg for water, and after they were given permission to draw it, were made to scrub the hand pump clean.

In a country where sanitation is a scarce facility, and since what is scarce is subject to public disputes, the principle of distribution operates along a caste-class axis. The landless suffer, the dalit landless suffer even more and dalit landless women suffer the most. Dalit women are often forced to use fields that belong to upper castes, leaving them susceptible to physical and mental harassment.

The problems arising from lack of literacy and education were reiterated. Dalit children face discrimination at schools. Their objective conditions force them to drop out of school. Many speakers felt that without education, the next generation too would be trapped into the same iniquitous social world that their parents inhabit. Lack of electricity in villages and alcoholism among men were problems which found mention.

The mode of transformation in demonstrably unequal societies is the political organisation of socially oppressed groups to assert their purportedly guaranteed equal rights. Right comes alive when claimed, and it can only be claimed when those who are guaranteed the right, but deprived of it, organise and struggle to attain it. Mere organisation does not secure it permanently. Neither do stray acts of militancy, successful or otherwise, necessarily enable the transformation of a backward social reality. The organised force needs to assert itself constantly until such time as the right is secured permanently. Only then can the legal framework itself be said to be reasonably democratic, and, most importantly, only then can the judiciary, especially at the lower levels, be forced to think and act differently.

Instances of such assertions were recounted at the convention in colourful and pithy terms, far removed from the customs and protocols of genteel society. Accounts were given of women organising themselves to ensure that policemen do not harass them, or even enter their village. Such organising also ensured that land legally theirs, but coveted by upper caste groups, was not lost. Most importantly there was a pride in being hardy, in not being pampered, in being able to withstand great hardships, in having a new identity, other than the caste-designated identity, in the strength and courage to sustain and endure attritive battles. It was a feeling of "we do not have the strength to bear any more, we only have the strength to fight". A poignant account of the struggle of the women of Kitmai village, in the Fatehpur district of Uttar Pradesh, was given. Rape of women in this predominantly dalit village was a routine matter. Collective action through the organisation of a Mahila Samhiti led to an improvement in the condition of women in the village.

The convention brought to the fore the need to look at the different forms of exploitation that take place and then to link these up so that a practicable emancipatory strategy can be devised. What also became obvious was the prevailing and worrying disjuncture between the more avant garde practices of the social sciences and the grim Indian political reality that awaits transformation. That the social sciences, such as they are, can exist, even flourish, in such a context is itself a telling statement.

Havana versus Davos

The Unbridgeable Chasm

Frederic F Clairmont

The world economic conference in Havana in January, called by the Association of Economists of Latin America and the Caribbean, was explicit as to its purpose: to ensure maximum participation in the free exchange of ideas. Nothing reflected the spirit of generosity of the conference better than the courteous public exchanges between the World Bank representative and president Fidel Castro.

TWO major world economic conferences straddling the ambiguous theme of globalisation occurred about the same time. The first, in Havana, by the Association of Economists of Latin America and the Caribbean; the second, by the world's biggest capitalists and their political hangers-on in the elite Swiss Alpine resort of Davos. That however was where the similarity ended. The first ruthlessly analysed the ravages of the economic, cultural, political and social policies of neo-liberalism, pressed so relentlessly by the satellite trinity of transnational capital and the US caste oligarchy: the World Bank, IMF and WTO. Its logo is uninhibited market freedom of capital, liquidation of the nation-state, and the wholesale obliteration of the democratic institutions that partnered it over the last two centuries. These policies were tantamount to a gulag of a special kind that literally involved job liquidation to the tune of millions. The name of the game is restructuring.

The Davos Forum, militant propagandist of transnational capital, was engineered to ensure the perpetuation and consolidation of the *univers concentrationaire* of Big Capital, with the *pensee unique* its dominant totalitarian trait. Understandably, its deliberations received world coverage in the corporate media in contrast to Havana. Was this not to be expected inasmuch as Big Capital and its mediatic protuberances are cesspools that hardly require publicity? Significantly, George Soros, Milton Friedman and John Kenneth Galbraith and others were invited to Davos but chose to stay away.

Organising Principle

The first thing that struck the participants in the Havana conference was the beauty of the surroundings. The hotel and its huge complex, one of the most stunning in the Americas, included the convention centre where the plenary was held – a source of enormous pride, financed, built, owned and managed by Cubans. The numbers attending the meeting were between 550 and 600. Simultaneous interpretation in five languages (including Chinese) was provided. Many of them were economists, engineers and workers and intellectuals and public figures such as Mme Mitterrand and many other prominent political, scientific and cultural figures from the Americas and elsewhere. The architects of this gathering were explicit as to its purpose: to ensure maximum participation in the free exchange of ideas. A goal that was consummated.

It was the antithesis of the *pense unique* for widely divergent opinions were expressed. Many corporate media enterprises were invited but not all came. The World Bank spokesman aired his views, nor was he boiled in oil for so doing. Nothing could have surpassed the spirit of generosity of the conference than the courteous public exchange in the plenary between him and president Castro. What country in the world, as an Indian delegate observed, could ever have financed and undertaken this project on such a vast scale, and that in a nation that still labels itself third world?

For five days the intense pace of work never slackened: from 10.00hrs to 22.00hrs with pauses only for meals. The research papers met the highest standards of academic scholarship. They will ultimately be printed and disseminated within Cuba and abroad as pedagogic materials to assist the reshaping of a crisis-stricken international economy.

Unfailingly, president Fidel Castro and certain members of his political entourage were always present, assimilating the knowledge revealed in the presentations. Happily, vigorous meetings of this kind will be institutionalised, if only as a countervailing force to the destructive force of transnational capital and its propaganda *apparatchiks*, of which the Davos Forum is a notorious exemplar. Havana, as a Colombian historian noted, was the twining of humanity and applied economics.

Here was a head of state raising questions, assimilating the new knowledge, venturing his observations forcefully but never dogmatically. His analysis was derived from the staggering diversity of Cuba's revolutionary experience over the last 40 years, nourished by his own extensive reading, discussions and meditations on international economic relations. He never pontificated but by his incessant quest for dialogue it was apparent that the congress had opened new vistas to him and indeed to all of us. In Cuba, the Special Period (following the demolition of the USSR and the socialist camp) is drawing inexorably to an end, perhaps too slowly for many, but nonetheless this is its trajectory. Growth is forecast, according to The Economist Intelligence Unit, to surpass 4.5 per cent this year. Macro-aggregates depict however only a very small part of the gigantic metamorphosis that this nation of 11 million people is traversing; and whose impact on Latin America remains irrepressible. A Jesuit participant came closer to the heart of the matter when he said that Cuba was the only country he knew in the Americas where children do not go barefoot, where they do not go hungry, where they do not sleep on streets, and where they were able to read and write. Monumental achievements by any standards no doubt but Cuba's achievements were much larger as so tangibly exhibited in this conference.

It was a poignant reminder also of the stark tragedies of the totalitarian Frankenstein of neo-liberalism and its maledictions. The congress was a bastion of criticality whose goal was to promote debate on current trends within the world economy by exploring avenues of research via new theoretical and analytical tools. Hence, it was not conceived exclusively as a debating forum but also one for the formulation of alternatives in which social justice, that sworn enemy of the neo-liberal gulag, becomes the noblest of realities.

Economic Background

What shaped the contours of the debate was the breakdown of international capitalism that has battered the world economy since the collapse of the Thai baht in June 1997. A firestorm that shows no signs of relenting, but of accelerating. The once vaunted Tigers, touted by the World Bank, the IMF and the US oligarchy as paragons of 'investor confidence', and the miraculous workings of unhindered capital flows are now squirming in the gutter of moral and economic decay. They are not alone: the credibility of the World Bank and the IMF is in tatters, shunned and assaulted even by the likes of George Soros who has lost faith in the system and transnational speculative orgies that were the source of his net worth of $ 25-30 bn

As the discussions highlighted, even the spokesmen of transnational capital and their media ventriloquist dummies can no longer dissimulate the system's putrefaction, demoralisation and a sense of impending breakdown that permeates corporate boardrooms. Japan is but one more example, followed by the Russian debacle of August 17. The rot did not and cannot be halted. The aftershocks of the Brazilian financial bubble and the wretched expediencies being taken, such as the appointment of one of Soros's agents to be boss of the central bank, dramatises the depths of an irreversible crisis. A moribund Mexican economy and its diseased ruling class, like that of Chile, is no more capable of weathering the typhoon than Brazil. Perhaps nothing is so humiliating as the liquidation of national sovereignty of certain comprador governments as Argentina as stressed by several speakers.

It has sold out the national patrimony to the TNCs, including the banking system. There is nothing much left to sell off. Everything that could be privatised has been privatised. These engulf transportation networks, airlines, gas, oil and electricity, and even streets. Vast tracts of the Argentinean pampas including farm holdings of as much as 4,00,000 hectares have been sold out to foreign investors, George Soros, one of the most conspicuous urban real estate dealers in Argentina, ranks also among its biggest latifundistas, as do the major US grain companies. Far more tragic is that the ruling class is crawling on its belly calling for the removal of the last vestige of sovereignty: replacement of the peso by the dollar. A once freed slave now hollering for the imposition of his chains.

Conclusion

It was appropriate that this path-breaking congress was held in Havana on the threshold of a new century. What it above all demonstrated was the vitality of a nation that had chosen a divergent development path, and for which it has been condemned to death by a foreign power; but which refuses to die or capitulate. A sizeable chunk of Cuban territory, grabbed one century ago, continues to be occupied by a foreign power that celebrates its rape of Cuba's sovereignty. But that's not all. The economic blockade imposed on Cuba has already cost the nation over $ 60 bn. The US in its unilateral action remains accountable to no one. It is a mockery of the very notion of a free multilateral trading system which the US claims to be defending when its political oligarchy has galvanised more than 40 laws and executive decisions to apply unilateral economic sanctions against 76 countries representing 42 per cent of the world's population. Globalisation is not an irreversible process. That is the moral of the congress. What has been globalised by the conquests of the TNC gulag can be de-globalised.

What the congress in its far-reaching debates served to remind us was that while the transnational corporation is an iniquitous institution it contains the seeds of its own destruction best glimpsed in the headlong thrust of the concentration of capital, revelatory not of its strength but of its weakness. Moreover, mass movements are emerging with impetuous force. Ultimately these movements will come to play a decisive role in reshaping the global economy and its peoples. It is precisely the advent of this mighty countervailing force that president Castro had in mind when he observed that inasmuch as the US today is the basis of globalised imperialism, the battle against its dominion must also be globalised.

The Nuclear Option

Some Economic and Strategic Issues

T Krishna Kumar

How are social choices made on the nuclear issue? What is the information base on the costs and benefits of generating the nuclear capabilities required to be termed deterrence? Does the nuclear option itself increase the threat of aggression from neighbouring countries which may mean additional costs without yielding any benefits? Can there be any estimate of possible damage if the deterrence fails?

BEFORE examining the nuclear option we need to have a working definition of what is meant by it. I define the nuclear option as: (i) a nuclear technological capability, supported by a sustained R and D effort, in the field of nuclear power generation; (ii) a capability to indigenously produce and process nuclear weapons material so that the country can be completely self-sufficient and self-reliant in producing the nuclear weapons; (iii) a capability to produce nuclear weapons of a type and intensity that can be regarded as at least equivalent or superior to what our neighbouring countries, which are presumed to pose us a nuclear threat, have; (iv) a surveillance and protection system to defend our defence installations and the densely populated areas from a possible first nuclear attack by our neighbours; (v) capability to deliver the nuclear weapons to the target sites in our neighbouring countries, and this needs to be done accurately and swiftly through surface-to-surface missiles, weapons-carrying aircraft, and submarines. These capabilities are implied by our country's pronounced policy of no first use of the nuclear weapons. Whether one adopts a first use or no first use policy the capabilities required seem to be almost the same.

These capabilities depend crucially on who our enemies are, from whom we fear a nuclear threat or a general threat of aggression. I therefore assume that these neighbouring countries from which we fear such threats are China and Pakistan. The first cited capability is a prerequisite for other capabilities. But it is also a capability that we need in order to be self-reliant in generating nuclear power for peaceful uses. Hence while examining the costs and benefits of such nuclear R and D one must note that benefits accrue to the peaceful uses of nuclear power as well. Of course, there is the tricky question of how to allocate the total cost of joint R and D effort between the peaceful purpose and defence purpose.

Our country exercises the nuclear option by our union government incurring huge military expenditure towards activities that are supposed to generate these capabilities. One of the basic principles of economics is that an activity should be undertaken if the economic benefits outweigh the economic costs. This principle applies equally whether one is considering a private expenditure or government expenditure. The only difference is that the problem of calculating the economic costs and benefits of public or government expenditure is somewhat messy. In addition, one must examine how the social choices are made regarding public or government expenditure on the nuclear issue. The calculation of benefits and costs at the individual level involves a high degree of personal and / or subjective judgment. Individuals have independent perceptions of these costs and benefits, and thus could take different positions on the nuclear issue. Then the question is how a social choice is made on this nuclear issue.

It is on this issue of mechanisms of reaching a social choice based on individual choices that our recent Indian Nobel laureate Amartya Sen worked. The majority decision, which is the hallmark of a democratic political system, can lead to some absurd results, called intransitivity of social preferences, unless some conditions are imposed on the preference structure of individuals. For instance, it is possible that one majority might prefer 20 per cent increase in defence expenditure to 10 per cent increase in expenditure on power, while another majority may prefer 10 per cent increase in expenditure on power to 10 per cent increase in expenditure on poverty alleviation, and yet another majority may prefer 10 per cent increase in expenditure on poverty alleviation to even 20 per cent increase in expenditure on defence. Sen showed that under certain reasonable conditions on preferences of people the majority decision rule will not admit such pathologies and that it would satisfy various conditions that a social choice must satisfy.[1]

It does not necessarily mean that the BJP, which enjoys a majority, is justified in its decision to follow the nuclear option. People may have different perceptions on the threat and costs associated with the nuclear option. These perceptions are based on insufficient and manipulated information available. The perceptions are also unclear and are quite uncertain and vague. It is not clear, for example, what the impact of increased defence expenditure is on the general price level, and on the level of poverty. When government resources are scarce and they are needed both for defence expenditure and also for an alternative such as poverty alleviation, one needs to know the trade-off between poverty alleviation and increased defence expenditure. It is therefore possible that with better and more information people may modify their perceptions. The social decision based on majority under that revised situation may or may not be in favour of the nuclear option. A nationwide debate on the issue may enable us to make informed and better social decisions through the majority rule of our democratic system. This is again one of the major conclusions reached by Sen: In a good democracy in which people have concern for one another, particularly for the poorest of the poor, in which there is freedom of speech and expression, and where people exercise their opinion through the vote, the social decisions will maximise the social welfare which includes protection of individual's rights and social justice.

We need to know what it costs in rupee terms to finance the activities that will generate the nuclear capabilities described above. Similarly, it is also necessary to know what is a reasonable estimate of the benefits associated with that expenditure in terms of rupees. While it is easy to obtain reasonable estimates of what it costs to pursue the nuclear option, the estimated benefits depend on the threat perceptions and how effectively the outcomes of the

expenditure eliminate or reduce the severity of those threats. At one extreme, if the threat perception is purely a myth then the benefits are zero; at the other extreme, if the threat perception is real and certain then the benefits can be enormous, provided that we assume that these capabilities that we develop do serve as deterrent to such a threat. I shall share with you my perception that this assumption may be wrong. As I will argue later the nuclear option can also increase the threat of aggression from our neighbouring countries which may mean costs, in addition to the expenditure on the nuclear option, without yielding any benefits whatsoever.

While the rupee value of expenditure on the nuclear option is known with some degree of accuracy and certainty, the rupee value of the outcomes of that expenditure is not so tangible. These outcomes are not goods and services traded in a market-place having a rupee value. These outcomes will have greater value if there are threats of greater intensity and frequency, if the threats have greater certainty of occurring, and if the defence expenditure results in outcomes which will reduce the threats or reduce the probability of realising those threats. There are a few questions that we have to pose: (i) What are the threats from our neighbours? (ii) Is the nuclear option a deterrent to those threats, as it is made out to be? (iii) How is the nuclear option a deterrent to those threats? (iv) Are there other less expensive ways of diffusing those threats or dealing with them?

The threats are: (i) Border disputes and border encounters with our neighbours; (ii) terrorist activity supported by the enemies, such as what we are experiencing with the ISI of Pakistan; (iii) a traditional war of aggression from one of the neighbours, or from both of them jointly, which does not use the nuclear weapons; and (iv) a threat of first use of the nuclear weapons by one of the neighbours or from both. One might argue that the first three threats do not relate to the issue of using the nuclear option. I am assuming that one of the reasons we wish to follow the nuclear option is to create a perception among our adversaries that we are capable of using it and thus create a deterrence among them with regard to the first three threats as well.

These are potential threats. There are different probabilities with which these threats may be realised at any future point in time. The greater these probabilities the greater is the potential threat. The next question is how do we estimate the social cost of these threats. One way of estimating the total cost of these potential threats is to quantify the damage caused by them and put a rupee value on that damage. Since the threats are uncertain and occur with certain probabilities the estimated cost of damages will have a probability distribution. We would then be able to calculate the mean or average rupee value of the probability distribution of such damage. The mean or average cost of damage does not adequately distinguish between a colossal damage, albeit with a very small probability and an equivalent moderate damage with high probability. Sometimes it is not possible to identify the extent of damage and to estimate its rupee value. In that case one standard suggestion made by economists is to take as a lower bound of such cost the value of social goods and services that are foregone (the cost of the next best alternative).

Threat Perceptions

What does the nuclear option do to the threat perceptions? One might expect that pursuing the nuclear option will either reduce the intensity of the type of threats that were listed above, or it will reduce the probability of realising those threats. In either case the mean or average cost of the damage due to those threats is reduced. This reduction in the average cost of damages may be taken as the benefit associated with the pursuit of the nuclear option.

Most countries today assume that nuclear weapons will not actually be used by the governments of other countries. This is due to social, political, and economic ostracising which it entails from the comity of nations. It may only serve the purpose of creating an atmosphere of deterrence. In other words, one might say that the threat of the first use of nuclear weapons by any country has a very small probability. By pursuing the nuclear option we are only reducing marginally an already small probability of the first nuclear attack by our adversary. Hence the reduction in the average or mean or expected cost of damage which can be attributed to the nuclear option is likely to be very small. Ultimately the estimate of the benefits is purely an empirical issue that requires information on the extent of threats, their likelihood and the damages caused by them, both with and without the nuclear option. Unfortunately we have very limited or no information on these aspects.

One might even argue that exercising the nuclear option would worsen the already hostile attitude our neighbouring countries have towards us. Hence it might provoke them to use other less severe threats than a nuclear attack from our neighbours; the latter being not an alternative at all for reasons just described. While the nuclear option might reduce very marginally the threat associated with a nuclear attack, it might increase the threat of less severe attacks by a much greater degree. The net result could be an increase in the cost of damage than a decrease, as advocated.

The deterrent theory, which is often advanced for following the nuclear option, is based on a fallacious premise. It assumes that the threat perception is based on the present situation and it also assumes that while we follow a strategic decision our adversary does not have a counter strategy. Game theory and strategic behaviour constitute some of the most commonly used concepts in economic theory. As an economist I wish to apply these to the nuclear issue. If we take a strategic position we must grant our adversary also a strategic response. If we produce nuclear weapons we must assume that our adversaries also either produce or procure nuclear weapons of equivalent or superior quantity and quality. Hence our initiative in producing the nuclear weapons will undoubtedly trigger a nuclear arms response from our adversaries. This situation would work like a sequential or a dynamic game between us and our neighbours and lead to an arms race.

A country like Pakistan that cannot match India in its resources will have to depend on military support from other nations. The geopolitical situation in this region will thus be seriously altered. At a time when we need to reduce tension and promote co-operation between us and our neighbouring countries, instead of going in that direction we are following the

Table: Capital Costs of a Nuclear Weapons Programme

		Rs Crore
One reactor to produce plutonium		700
One missile production facility		500
Cost of 150 nuclear bombs of 15-20 kilo tonne capacity		600
Cost of missiles		4,025
55 Prithvis	385	
30 Agnis	1,500	
25 Agni -IIs	1,500	
16 Sagarikas	640	
Cost of fitting one IAF squadron		60
Cost of three nuclear submarines		12,000
Cost of C^3I		3,525
Cost of two satellites		2,000
Cost of radar, missiles, etc, to protect airbases/launch sites		5,000
Total		28,000

nuclear option. The consequences are quite clear in a world with only one superpower, after the dissolution of the USSR. We are prompting our neighbouring countries to either collude against us or to have an alliance with the superpower. This strategy is bound to isolate India from several countries which are looking for India's leadership in the non-aligned movement to restrain the use of power by the superpower. Instead of prompting the nuclear powers to follow the policy of nuclear disarmament, the Indian move is likely to isolate India, as it already has, with no change in the nuclear disarmament situation. Our country's position in the international context is likely to become weaker than stronger.

As an isolated country we have to depend on ourselves in this game of arms races. A poor country like ours cannot afford to devote increasing resources year after year for such activities at the expense of the growth of the real economy. It may be recalled that it is this kind of arms race and the diversion of resources to defence expenditure that had destroyed the USSR. Another major concern expressed by some industrially developed countries, such as the US, is that nuclear proliferation might make misuse of the nuclear weapons easy. This point must be taken seriously given the degree of international terrorism today. A country like ours which cannot catch an alleged outlaw Veerappan with the support of the police of two states and that of the border security force, may not be able to ensure the safety of nuclear weapons once they are created.

If our main objective is to reduce the potential of threats from our neighbouring countries there may be other alternative approaches available. We do not seem to have explored all the other alternatives. Transactions between neighbouring countries, whether such transactions are political, economic, social, or cultural could be based on co-operation or conflict. We may say that such transactions are outcomes of a game repeatedly played by these neighbouring countries. Economists have demonstrated that in repeated games of this nature it is quite often advantageous to play it co-operatively than non-co-operatively. It is also shown that the scope for co-operation increases if there are more transactions. Hence one of the options we should follow is to increase the co-operation between neighbouring countries and ours by increasing the economic, social and cultural transactions between us.

Finally there is another important aspect associated with the choice of the nuclear option: India had earned a name as a peace-loving country that was the abode of a Mahatma who preached 'Ahimsa'. India is also one of the founders of the principle of non-alignment. Should we lose such an identity with our decision to pursue the nuclear option? This is also a decision that was taken by the present government in secrecy without having a prior nationwide debate. By following the nuclear option we as a nation are earning a bad name of initiating nuclear proliferation among developing countries that cannot safeguard nuclear weapons from being misused by terrorists. Having seen what the nuclear bomb had done to thousands of people in Hiroshima and Nagasaki it is hard to understand how our country can adopt a policy of triggering the use of such weapons of mass destruction. One argument often presented is that the nuclear powers have such weapons and have not disarmed themselves. It does not call for further production of nuclear weapons; instead it calls for a move towards a peaceful pressure on those countries to seek nuclear disarmament. One must distinguish between the historical context in which such weapons were produced and are being stockpiled from any new moves to produce them. It is this distinction that underlies the Comprehensive Test Ban Treaty (CTBT) and Nuclear Proliferation Treaty (NPT).

Now let me return to the basic economic issues and present some rudimentary economic statistics. These estimates are based on those by a fellow economist C Rammanohar Reddy in a series of three articles published in *The Hindu*. It is estimated that in 1955-64 when China was quite active in building its nuclear capability it spent on its nuclear programme about US $28 billion (1996-97 prices). Of course as Rammanohar Reddy correctly states this expenditure was incurred by China when it developed the technology in isolation and when the base knowledge was still under-developed. In our case the cost could be much less. Further our space programme, which has produced Prithvi and Agni I and Agni II missiles already, incurs some of the cost for the delivery system, and hence these are what economists call sunk costs.

General K Sundarji states that a minimum deterrent effect will be achieved by an arsenal of 150 nuclear bombs, each of 15-20 kilo tonne capacity of the kind dropped on Hiroshima and Nagasaki, that could be delivered by the already existing aircraft and missiles. He puts the cost as Rs 2,760 crore in 1996-97 prices. This would be approximately US $ 0.7 billion (1996-97 prices), which is only two and a half per cent of what China spent in building its programme between 1955-64. But Sundarji's estimate did not include command, control, communication and intelligence system (C^3I) that is absolutely necessary for ensuring the deterrent effect. Nor did it consider using submarines for carrying the nuclear weapons. Brigadier Vijay K Nair gives an independent estimate of Rs 6,835 crore. This estimate includes C^3I and a nuclear submarine. This would be around US $ 1.7 billion, which is only about 6 per cent of China's expenditure on the programme spent between 1955-64 (1996-97 prices).

Rammanohar Reddy gives a detailed break-up of the estimate of capital costs of Indian nuclear weapons programme that can serve as a nuclear deterrent (see table). His estimate of capital cost in Rs 28,000 crore. This figure does not include the R and D cost for nuclear power generation capability that I would put at the top of the list of capabilities. But if one adds the operating costs, wages and salaries, fuel costs, transportation costs, R and D for C^3I, etc, this estimate rise go to Rs 40,000 crore to Rs 50,000 crore, over a period of 10 years, or about Rs 5,000 crore per year. This estimate does not take into account the hazards and environmental impact of the nuclear wastes. There is a recurring cost associated with safeguards against hazards. In addition one may assume that nuclear plants have a lifetime of about 100 years, and after that they have to be decommissioned ensuring safe disposal of nuclear material. This decommissioning of the nuclear plants involves some additional costs. It is suggested that these costs would be several times that of other costs. Even if one assumes that they are twice the other costs it would amount to Rs 1,00,000 crore. The annualised cost would be Rs 1,000 crore. Thus, the annual cost of the nuclear option is about Rs 6,000 crore.

How do these figures compare with other transparent numbers? Our country's gross domestic product (GDP), is of the order

of Rs 1.25 million crore (1996-97 prices). The annual additional defence expenditure is about one half of 1 per cent of our GDP. Our tax revenues are of the order of 10 per cent of our GDP. The additional defence expenditure is therefore of the order of 5 per cent of our tax revenue, which is already quite low and quite inadequate to even for the several important government programmes. Comparing the additional defence expenditure with the next best alternatives foregone, viz, expenditures on various social services, with Rs 6,000 crore one can run 15 lakh primary health centres, by spending that amount the government can have a two-fold increase in its expenditure on primary education and meet the entire cost of universal primary education.

To give another illustration. We have a foreign debt of US $ 90 billion. Assuming an average interest of 8 per cent per year the annual interest payments are about Rs 28,800 crore. The annual cost of the nuclear option is therefore a little more than one-fifth of this annual interest burden on our foreign debt. This is a very important comparison in the context of increasing trade deficit and increasing foreign debt. It is the imprudent handling of foreign exchange situation in the 1980s that resulted in the financial crisis of 1991. One may recall that during Indira Gandhi's regime as a political strategy the soft IMF loan was prematurely paid back in two years just prior to the general elections. This forced the government to borrow at higher commercial rates of interest. Rajiv Gandhi soon thereafter liberalised the economy allowing imports liberally when the exports did not register much growth. The increasing trade deficit and the high interest burden lead our country to a foreign exchange crisis in 1991. It is this crisis that made us dependent on the IMF and the World Bank which imposed conditions for giving loans. It is these conditions which almost eliminated our autonomy in choosing our economic policies. All this happened when our economy was doing very well internally with a two-digit growth rate. It is therefore very important that we manage our foreign exchange very carefully.

One must recognise the futility of pursuing an arms race when the country does not have enough resources. This is made amply evident by the arms race policy of former USSR and the US. The dissolution of the USSR was due to its failure to meet the basic needs of its people as result of diversion of sizeable resources to the arms race with the US. A country can compensate for its military weakness by making its economy strong. This is made evident by Japan's economic hold on the US economy. Let us put first things first and take care of our foreign exchange situation, primary health, primary education, and poverty alleviation before we gamble with a possibly futile nuclear programme.

Note

[Based on a talk delivered to an informal gathering of scientists at the Raman Research Institute, Bangalore on November 14, 1998. The author thanks Alladi Sitaram, Vinod Vyasulu, and the participants at the informal gathering for their comments. The author alone is responsible for any errors.]

1 The condition is that given any three alternatives there is a consensus on at least one of them as the least preferred, most preferred, or with median preference. Such a condition will be satisfied if people communicate with each other and show concern for each other. This situation may be expected to prevail in a good democracy

Impure Economics

C T Kurien

Economics as Ideology and Experience: Essays in Honour of Ashok Mitra edited by Deepak Nayyar; Frank Cass, London, 1998; pp xviii + 291, £ 19.50.

I

THIS volume consisting of a biographical sketch of Ashok Mitra by the editor, Deepak Nayyar and sixteen contributions by leading Indian economists and a couple of foreign economists is a fitting tribute to the man in whose honour it has been brought out. The volume was conceived and planned by Amit Bhaduri, Nirmal Kumar Chandra, N Krishnaji, Deepak Nayyar, Prabhat Patnaik and Krishna Raj. The biographical sketch concentrates on Ashok Mitra as an economist, but also touches upon his role as an administrator, parliamentarian, columnist, cricket enthusiast and a true friend to many, drawn from different walks of life. The contributions were referred and, as many of the contributors acknowledge, revised on the basis of the comments of the anonymous referees.

The reviewer has a problem, though, in dealing with a volume of this kind without an overall theme. I shall exercise the reviewer's liberty to reorder and reclassify the essays. I start with four of them which deal with specific topics. The rest will be grouped into three broad themes.

II

The opening essay by Prabhat Patnaik is an attempt to show that unemployment in underdeveloped countries is of a special kind, different from the three familiar types: the first arising from shortage of means of production; the second related to insufficiency of aggregate demand; and the third, resulting from rigidity of real wages. With the help of a model involving heterogeneous output, specificity of production processes including differential skills of workers, and specification of demand patterns, Patnaik shows that a kind of unemployment not explained by the above three can exist. The real life situation corresponding to it is said to be where goods produced by workers in an underdeveloped country (let us say hand woven cloth) cannot be consumed by the workers themselves while others in the country and consumers in other countries prefer a substitute (let us say mill produced cloth). Therefore, says Patnaik, the nature of this kind of unemployment is related to 'lifestyles', particularly, the desire of the well-to-do sections in underdeveloped countries to imitate the patterns of life prevailing in developed countries. This may be so. And yet, it is difficult to accept that this form of unemployment, even when it is widespread, has the theoretical generality that the other three types have. Be that as it may, how valid is Patnaik's claim that "this kind of unemployment has not figured in the economic literature"? To those of us for whom D R Gadgil's *The Industrial Evolution of India in Recent Times* was staple diet, it is not novel at all. "One of the most harmful effects of a foreign rule is the imposition on the conquered peoples of the ideals of the conquerors", noted Gadgil and went on to say, "the newly created Indian bourgeoisie showed itself during the latter half of the last century extremely ready to accept European standards and to pour scorn on everything Indian". Gadgil offered this as explanation of the decline of Indian handicrafts which, of course, led to the craftsmen remaining involuntarily unemployed and their equipment underutilised. And Gadgil wrote before Keynes put forward insufficiency of demand as the explanation for involuntary unemployment.

Amiya Kumar Bagchi's contribution is a discussion on rent-seeking, concentrating on rent-seeking by merchants, financiers and industrialists setting it in historical perspectives. Rent-seeking by these groups arise from the private monopolies they strive to establish. Modern TNCs which combine trade, industry and finance have an excellent opportunity to derive rent via their global operations. And in their operations they derive support from national governments and international agencies like IMF and World Bank which claim to be against rent-seeking by public enterprises. "For example", says Bagchi, "in India, the government has guaranteed a return of 16 per cent to foreign enterprises investing in the power sector ... Thus, not content with the rents generated through private monopolies, TNCs have found new vantage points for rent-seeking under a regime which ostensibly wants to abolish rent-seeking in public enterprises ..." (p 119).

Ranjit Sau's paper brings out the point that in an economy such as India's, which maintains several modes of production, it is necessary to have structural macro economics that explicitly recognises not only capitalists and workers, but other classes as well. Sau also sets up a model that deals with the relationship between industry and finance which provides insights into the complex relationships and cleavages among industrialists ordinary and monopolist, domestic and foreign.

Taking off from Ashok Mitra's pioneering work on class structure and terms of trade N Krishnaji and (the late) T N Krishnan have an interesting empirical analysis of how terms of trade influence the structure of demand. They come to the conclusion that in the Indian economy there is in operation what may be described as a food constraint on growth. "About a third of the population is not able to eat enough by any norm. For perhaps another third or more, the income elasticities of food expenditure tend to be high as a result of both quantitative and qualitative preference. The market for manufactures is then constrained by low levels of residual incomes left over after food needs are met"(p 136).

III

I turn now to those contributions which can be clubbed together under common themes. One of these themes, recognised in the volume itself is "The Comparative Dimension". It consists of Terence J Byres' essay on the need for the comparative method in the social sciences, Utsa Patnaik's comparison of India and China in terms of agrarian change and the contribution by Jayati Ghosh and Abhijit Sen comparing the international capital flows of an earlier era with the contemporary situation. Byres draws a distinction between the variable-oriented and case-oriented approaches to comparative studies. Examples of variable-oriented comparisons are the time series kind that Simon Kuznets' work illustrates, the cross-section variety that is used in inter-country comparisons by many UN agencies and inter-state comparisons by many scholars in our country itself. This approach has many strong points, especially the quantitative estimations and relationships that it helps in establishing. It has many limitations too because by identifying an entity in terms of its decomposed variables, it

abstracts from complexity and diversity in its search for the general. In one of its familiar versions, a particular argument is expounded and evidence is selectively marshalled from different instances to substantiate it. The case-oriented approach, a common instance of which is comparisons of two periods in historical research, can be more thorough in one sense, but it has its inherent limitations too. Byers suggests that though the usual practice is to use the experience of the past in the understanding of the present, the opposite also is possible. He observes that Ashok Mitra's work on inter-sectoral terms of trade is likely to be enlightening for those European historians who might wish to do serious work on this neglected aspect in European economic history.

Byers does not mention comparisons of economic systems as an instance of the case-oriented approach. But that is the focus of Utsa Patnaik's comparison of the patterns of agrarian change in China and India. She carefully documents the generally accepted position that radical land reforms in the post-revolutionary China enabled that country to mobilise the abundant supply of labour power and use it for capital formation in the rural areas. India, on the other hand, by failing to implement radical land reform has not been able to generate that kind of dynamism. The case-oriented approach is, thus, used to distinguish between the 'revolutionary' and the 'conservative' paths of economic transition and to insist upon the central role of institutions in the process of transformation. While the validity of these claims can be conceded, two questions have to be raised about the method itself. The first is what institutions are to be taken into account in such comparisons: only those that are directly related to the problem under discussion or a larger set? Whether the loss of life that occurred in China in the late fifties and early sixties has been exaggerated can be debated (On this Patnaik has some very pertinent observations on pp 249-50.) It can also be argued whether the famines that caused the loss of life and the series of bad harvests of the period can be attributed solely to the radical organisational shift to large-scale communes. But is it possible, as has been suggested by other scholars, that if the institutions of participatory democracy and a free press had existed in China, perhaps the enormous loss of life could have been avoided? Secondly, the comparison of two paths rests on the assumption that the "initial conditions" were similar. Patnaik maintains that there were "enough similarities in the initial conditions, despite all the differences, to make a meaningful comparison of the two countries' strategies of development" (p 223). But would the radical reorganisation of land ownership in China have been possible if the rural landlords had not been driven out during the civil war and the activities of the red army prior to the launching of the development strategy? And was there, in this sense, a major difference between the initial conditions of the two countries that makes it difficult to evaluate the differences in their strategies?

Similar questions about the comparative method arise also from the contribution of Ghosh and Sen. They do well to point out that the view that the large-scale international movement of capital is a recent phenomenon of the 1980s and 1990s is not valid. True, these two decades have witnessed a phenomenal increase in the global movement of capital compared to the immediate post second world war decades. However, as a proportion of the GNP of the industrial countries their capital exports have been less than 3 per cent in the past two decades compared to well over 3 per cent in many periods in the second half of the 19th century and a high 4.9 per cent in 1913 (p 266). But are the meaning and implications of capital movements the same if, as the two writers point out, there is a substantial growth of *gross* flows of capital across countries now? They point out other differences as well. Now there is no clearly defined 'leader' of the world economy in the sense in which Britain played the role during the years of the gold standard. Also, "while the explosion of finance in the late 19th century occurred in the context of stable and growing aggregate output and income in the industrial countries, high and rising investment rates and a general boom in world trade, the recent spurt in finance and capital market does not have such a favourable background" (p 270). Given these differences and many more that can be cited, the methodological question from a comparative study perspective is whether the recent spurt in international private capital flows can be, should be, treated as a qualitatively *new* phenomenon representing a departure from what happened in an earlier period. More boldly, does the present signify a *new phase* of capitalist development? Can the answer be given based on experience or does it belong to the realm of ideology?

IV

Papers by Nirmal K Chandra, C P Chandrasekhar and Amit Bhaduri deal with problems of former socialist regimes. Chandra's thesis is that the fall of socialist economies, of the Soviet Union in particular, was brought about by the "time bomb of consumer subsidies" (p 28). He points out that Marx in his *Critique of the Gotha Programme* had stated that in the first phase of communist society the individual producer receives back from society what he contributes to it after deductions have been made for the common satisfaction of needs such as schools, health services, etc. From this and the writings of Engels on the subject Chandra states that Marx and Engels did not favour increasing subsidies on food, clothing and housing during the transitional phase to communism. He points out that the extraordinary stability in food prices in the Soviet Union was a post-1965 phenomenon and that by the 1980s subsidies for food, housing and transportation claimed a very high proportion of Soviet expenditure. Chandra, however, points out that consumer subsidies alone could not have brought about the collapse of the Soviet system if other elements in the system had functioned well.

In what I find a fascinating essay, Chandrasekhar probes the problems of centralised planning which most socialist regimes had resorted to. He brings out some aspects which have not received sufficient attention so far. First, it was assumed that once private ownership of resources was abolished the entire economy can be treated as one big factory and could be managed on the basis of principles underlying the internal administration of factories. However, the despotic character of technology within capitalist factories as overlooked as also the fact that the inherent hierarchical nature of factory organisation would lead to excessive bureaucratisation. Second, the emphasis on the factory-society parallel ignored the fact that in capitalist societies an abundance of consumer goods for upper income groups was made possible by diverting resources from meeting the basic needs of the poorer sections. Socialist economies avoided this trade off initially, but once they got caught up with the desire to 'catch up' with capitalist countries in terms of the product profiles of the latter, it became difficult to follow the socialist principle of meeting basic necessities of all citizens and ensuring high levels of investment. Third, to the extent that socialist economies guaranteed free choice of occupations and a market for labour with difference in wages between different types of work, it became necessary to permit free market operations

for consumer goods also. Hence it was no longer easy to specify the areas of control of the state. Chandrasekhar concludes by saying: "Both theory and experience with socialism in practice suggest the assumption of the possibility of an omniscient state underlying the 'planning principle' is extreme. Once we do away with that assumption, however, we are left without an alternative structure of functioning institutions, in societies with social ownership. That is, even if we postulate a socialist economy as a planned economy, until we have specified the precise categories of decisions that are centrally planned, the institutions that would make decentralised decisions, and the fall-out of central decisions for the operational functioning of lower units of command, we have not fully specified the system. We are also still left with the problem that the extent and organisational form of decentralisation needs to be defined so as to avoid importing in full the instability and waste of capitalism" (pp 45-46). He is right also in affirming in the words of Maurice Dobb that only experience can decide the expedient extent of the one and the other.

Bhaduri tries to make more explicit the 'inner contradictions' of the system itself that led to the collapse of the socialist economies. Unlike capitalist accumulation, Bhaduri argues, socialist accumulation was based on a bureaucratic management of demand. The system "faced a double squeeze: real wage restraint was severe to finance investment accumulation and, at the same time, wage goods were absent or hopelessly scarce because of a bureaucracy-driven investment programme" (p 77). It may have worked or been accepted in the early stages, but over time it led to "a growing *separation* between bureaucratic central planners allocating investments and ordinary consumers generating the patterns of demand"(p 77). The system did not and could not correct this malaise and collapsed in the end. Bhaduri does not leave it at that. He goes on to say: "Without any independent self-correcting economic or political mechanism, extraneous to the Party structure – either in the form of a reasonably functioning market mechanism or in the form of political democracy of countervailing centres of power – the socialist experiment of creating a 'better society' could not have succeeded. It failed not because it made mistakes, but because doctrinaire rigidity ruled out serious attempts at correction" (p 79).

Chandra, Chandrasekhar and Bhaduri provide explanations for the failure of the socialist experiments of the past. Further research along these lines is vital for a proper understanding of what happened and to provide guidelines for the future.

V

I am bringing the remaining papers in the volume under the general theme of the role of the state in the economy and related issues. First there are papers that deal with particular aspects of the broad theme. Iqbal S Gulati points out the magnitude and implications of international public borrowing stating that even during the 1980s when both internal and external public debt in India increased rather quickly, it was the internal debt that was racing ahead. Gulati also makes the point that the real problem, however, is not that internal debt is high and rising, but that increasingly government funds are being deployed unproductively.

The late Pramit Chaudhuri has a critical appraisal of the role of the state in poverty eradication. On programmes of employment generation he points out that only if additional employment is created at the lower end of the wage-skills spectrum will such programmes have any dent on poverty and that 'growth-mediated' and 'support-mediated' policies are not alternatives, but have to work hand-in-hand. Chaudhuri also warns that it is difficult to think of the state as working to empower the poor, because that will be to participate in the diminution of its own powers.

With inside experience of the planning process A Vaidyanathan makes an evaluation of planning in the country indicating the distinctive features of Indian planning, especially its intimate links with the political environment. Under the changed economic and political conditions Vaidyanathan recommends that the Planning Commission should become "a forum for strategic thinking, a medium for getting the relevant expertise from concerned enterprises, universities, and laboratories together to examine the problems and come up with solutions, and an interlocutor with the government to establish appropriate policies and institutional arrangements" (pp 196-97).

Rehman Sobhan makes a survey of public sector enterprises in the third world and the prevailing mood of privatisation. As against the widely prevalent notion that the establishment of public sector enterprises in third world countries was influenced by socialist doctrines, Sobhan claims that in the context of decolonisation it was the need to bring foreign enterprises owned by non-indigenous bourgeoisie under national management that led to the formation of public enterprises: it was essentially a process of nationalisation in the literal sense of the word. These enterprises that, thus, came up in response to practical exigencies have, of late, come under the ideological onslaught of the IMF and the World Bank committed to the cult of privatisation. The ideological pressure is accompanied by the opportunity that a new coalition of the present ruling classes and the bureaucracy finds to take over state-created assets on terms that the coalition is now in a position to dictate.

Through a study of the historical evolution of markets and a critical evaluation of the performance of 'market economies', Arun Ghosh examines the role of governance in economies. He shows that whatever may be the claims put forward in theory that markets ensure efficiency, the actual performance of market economies is characterised by enormous waste of resources. Ghosh then moves on to show that 'market economies' (as capitalist economies are frequently referred to in popular writings) do not function on the basis of their own laws and that they cannot function without a central authority that the state represents. "The nature of the market system is inextricably linked to the nature of the state", he argues (p 61).

Although this position is reflected in the writings of others in this volume (see, in particular, Bhaduri, p 78) nobody really develops the theme to bring out the centrality of the state in a modern economy (a modern *capitalist* economy) with roles much more than as a regulator of markets. This may be because when economists write qua economists, they tend to treat the state as an external entity as standard conceptualisations of the economy have no place for the state *within* it. In the context of the evolution of the theory of international trade Deepak Nayyar brings out the consequences of economic analysis that leaves out the state and the political processes that the state in one sense epitomises. Going back to the writings of Smith and Ricardo on international trade Nayyar shows that their concerns did not lie in abstract economic principles. They were motivated by a strong desire to challenge the political dominance of mercantilist ideology. Hence they viewed international trade not merely as an expression of comparative advantage, but in terms of its impact on income distribution, capital accumulation and economic growth. Subsequent economic theorising about international trade began to separate the economics from the politics. It is not necessary to go into the history of this divorce

proceedings. We only need to note that neo-classical economic theory ratified the divorce, cleansed economics from politics, made the state an external intruder and produced a corpus of economics pure and simple – perhaps more simple than pure.

In international trade theory this has meant, for instance, that while the cross-border movements of goods and capital are said to be governed by economic principles, the movement of labour is considered to be regulated by the laws of the state. Capital now claims the right to move freely across national boundaries as a matter of economic necessity, but workers come under regulations of various sorts if they try to move from one country to another. The former comes under economics and the theory of international trade; the latter is treated as migration and is studied by the less advanced disciplines! In such a situation the interactive causation between international trade and international migration, which may run in both direction, remains unexplored, observes Nayyar.

Ashok Mitra the economist would have nothing to do with such economics removed from experience for it readily becomes mere ideology and not a tool to analyse real life problems. This collection of essays in his honour would have been more complete if it had a contribution dealing directly with the divorce of economics from politics and its contemporary consequences.

Consumption, Poverty and Environment

Sanjeev Prakash

Human Development Report 1998, published for UNDP by Oxford University Press, New Delhi, 1998; pp 228, Rs 375.

SINCE UNDP's annual *Human Development Report* (HDR) was initiated in 1990, it has generated a valuable, critical perspective of the conditions required for a just, sustainable and human-centred development process. Successive HDRs have laid particular emphasis on policies and institutions to address the condition of the most disempowered, marginalised and impoverished groups within nations and in the world as a whole. In offering their characteristically powerful critique of currently influential development policies, particularly when measured against the tasks of fulfilling objectives of universal primary education, equitable economic opportunity, basic health, popular participation, gender equality and poverty eradication, as well as in their continuing stress on the potential of informed and well-directed political action, the HDRs have been marked as much by a spirit of conceptual clarity and incisiveness as by a canny appreciation of the value of salience in political discourse.

In achieving what is doubtless a difficult balance the HDR authors have had to tread a fine line between the often competing claims of conceptual rigour and empirical complexity, ivory tower idealism and pragmatic realism, universal acceptability and cultural particularism. Most usually, however, this balance has been achieved with great adroitness and tact.

The theme of this year's HDR is global patterns of consumption in relation to human development. In comparison to earlier years this year's report seems to have ventured into more uncertain ground. Though this may partly be because many aspects of its principal theme remain spiritedly contested within the natural and social sciences, this year the authors also seem to have fewer original ideas to offer, an analysis that is on the whole less clear and penetrating, and policy prescriptions that are sometimes too general and present considerable difficulties for adaptation into viable instruments for economic policy and law in comparison with earlier years.

Given the nature of the theme of this year's HDR, it would be particularly valuable to have an insightful analytical synthesis at this juncture. Studies of consumption, its driving forces, distribution, natural, institutional and technological sources, social and environmental impacts, as well as its implications for human development, constitute a complex, transdisciplinary and challenging range of concerns into which it would be particularly valuable to bring some order, clarity and practicality.

This year's HDR authors have achieved somewhat less than this. Their attempt to arrive at a theoretical synthesis of consumption, the environment and human development suffers from a lack of the analytical rigour and sharpness evident in previous HDRs. It also seems constrained by passing references to what are clearly central concerns given the issue of patterns of global consumption, and by a limited empirical base that excludes key studies and conceptual issues which would have revealed important new dimensions of the subject. I will restrict myself to two or three areas in which these omissions and contradictions seem to be most acute.

Admittedly, disciplinary perspectives on human consumption are markedly divergent: it is a long way from the rational, individualist, utility-maximising actor of neoclassical economics to the socially embedded actor for whom consumption is a principal means of establishing social relations, identity and status, a view that emerges from recent work in the social sciences. Attempts to analyse or reconcile these divergences remain rare but critical.[1] The HDRs have always stressed the importance of human functionings and capabilities in relation to socially contexted goals, as well as the crucial role of public investment and social institutions in enhancing the level of human welfare and the human development index (this also applies to various other indices that have been proposed in the previous reports, such as the gender development index or the human poverty index). Given this range of concerns, one would assume that a concomitant degree of attention would be paid to broader, socially contexted views of consumption and environment pollution that have emerged from recent theoretical and empirical work.

Social scientists like Mary Douglas and population-environment modellers such as David Coleman as well as others have argued that because human aspirations everywhere focus on the symbolic and the prestigious, consumption levels are generally higher and maximum population numbers below the physiological limits in nearly all societies. This condition makes models of human consumption and environmental harm more complex and multi-dimensional (for instance, due to asymmetries in equity, technology, and trade, and collective or cultural norms) than simple, linear models are capable of treating.[2] Yet there is little treatment in this year's HDR of variations in interdependent utility functions in different cultural and normative settings, or of the social and institutional limits to consumption and environmental stress that are critical in this regard, apart only from passing mention of Veblen's idea of conspicuous consumption and one excellent passage on the exclusionary effects of social inequality and asymmetric consumption.[3]

Incomplete View of Poverty and Environment Linkages

Such omissions seem particularly pronounced when it comes to the analysis of interlinkages between poverty and

environment. Broadly, the authors propose (over pages 66 to 83) the dominant 'downward spiral' view, in which environmental degradation increases poverty which in turn intensifies environmental degradation. This view is derived principally from works of various western authors who tend to take a macro-level systems view of such issues.[4] Such a view is also consistent with the 'bell-curve' suggested as a general indicator of the relationship between income per capita and environmental degradation by the World Bank in 1992. In this view, increases in income first lead to greater environmental degradation but if sustained ultimately lead to diminishing environmental impact.[5]

It is important in this context to clarify certain key definitions. The bell-curve relationship may be accurate when the degradation specified is an index of industrial effluents, but it is false when applied to the natural resources that sustain poor rural communities in most parts of the world, or when an aggregate of greenhouse gas emissions are concerned. As economists including Kenneth Arrow and Partha Dasgupta have noted, such generalisations are misleading.[6] Indeed, Dasgupta comments that the bell-curve idea is "tantamount to saying that there is trade-off between the environment and income in the short run but in the long run this trade-off disappears". He also argues that the relationship between income and environment degradation depends on how income is measured; it will not resemble a bell-curve when income is taken to mean NNP per capita where the shadow value for the depreciation of fixed capital includes depreciation of both manufactured and natural capital.

Significantly, a wide range of empirical studies present a far more complex picture of the relationship between poverty and the environment. In this context it is useful to distinguish between different types of poverty. In cases of rural subsistence poverty, environmental degradation can contribute to poverty by decreasing the supply of biomass resources required for subsistence. However, the evidence that this situation invariably creates further degradation of the environment is far from convincing. For instance, a series of empirical studies by Vijay Jagannathan and others have suggested that rather than poverty it is features of the economic system such as market incentive structures, the pattern of public investments in infrastructure, and macro-economic factors that are the root causes of land, water and environmental degradation in areas of widespread poverty.[7] These and other authors also found little evidence that the poor in the rural areas they studied possessed either the capital or technology necessary for extensive degradation of the environment.

Much depends on the coping strategies of the poor, which are in turn related to the options available to them, prevailing policies and social factors. These factors can include the presence of social capital that underlie the formation of institutions for collective action to regulate use of local environmental resources. Karl Polanyi long ago pointed out that a moral economy comprising essentially of norms of reciprocity and an entitlement to subsistence, both key aspects of social capital in rural subsistence contexts, has operated in most subsistence societies through history.[8] It is possible to think of poor people as lacking certain kinds of resources and capital but not others; for instance, a lack of financial and human capital does not invariably mean that natural and social capital are also lacking to a similar degree.[9]

Based on the empirical evidence available, David Pearce and Jeremy Warford conclude that the presence of poverty does not mean that environmental degradation will follow as a result, that rather than being an underlying cause of degradation, poverty is properly seen an intermediate expression of other factors responsible for degradation.[10] They further suggest that in the case of rural subsistence communities as well as other kinds of poor communities, poverty is characterised by low resilience to shocks and risks caused by macro-economic factors or natural disasters. If these underlying shocks and causes are absent, poverty will persist but without causing environmental degradation.

The report does discuss this low resilience to risks and shocks at any length, and suggests that the poor have an inherently short time horizon with respect to the use of natural resources, thus unfortunately confirming the view that varying approaches have simply been gathered ad hoc from different sources without attempting the difficult task of constructing a coherent and rigorous analytical framework. A short time horizon suggests a rate of discount for the value of environmental resources that the income-poor do not display when risks are managed and mitigated, either through collective mechanisms or successful policy intervention. There is little evidence to suggest that poor people have uniformly short time horizons in diverse risk environments, nor that their average time horizon is very much lower than for other groups facing high risks and shocks from policy failure or other causes.

Policy Implications

Critical to the discussion is that each view of the poverty-environment relationship has very different policy imperatives. If poverty is always a root cause of environmental degradation, then little else is helpful apart from standard poverty alleviation measures. On the other hand, if the real cause of degradation is chiefly the low resilience of poor people to shocks and risks, then a broad range of other measures including enabling policies to encourage natural resource management by local institutions, the provision of soft credit particularly during periods of high risk (for instance, due to macro-economic change and natural disasters), as well as the supply of cheap fuel, clean drinking water and other environmental entitlements are called for. It should be noted that research to further our understanding of these issues is still weak and underdeveloped. However, the second approach also raises intriguing questions for future research; for instance, particularly useful would be studies that tell us how the presence of micro credit institutions and the provision of credit to rural poor communities during periods of high risk have affected the short-term utilisation and degradation of environmental resources.[11]

The report extensively analyses the unequal burden that various forms of environmental degradation, including water pollution, industrial hazards, solid waste, soil degradation, deforestation, etc, impose on poor people and in this as well as in many other areas it displays an active and urgent concern for the interest of the poor. This is indeed a valuable contribution in analytical and policy terms. Unfortunately, its conceptual framework dictates that the poor are seen as largely passive, fatalist and unwitting progenitors of environmental degradation rather than dynamic actors who (like other human beings) must balance conflicting interests and act on the limited and continually changing range of options available to them.

There are other generalisations that seem out of place in what one expects in an impeccably researched document. For instance, on page 79 the report suggests that the impacts of global warming in terms of the distribution of rainfall will accentuate current shortages in the developing countries,

> the effects [of global warming] will be distributed in a way that will generally

worsen existing inequalities and patterns of poverty and hunger...yields are expected to fall in Africa, south Asia and Latin America, where most of the world's poor and hungry live...It is the same story for rainfall. By and large the haves, who get enough now, are expected to get more, while the have nots will get less. Water shortages are expected to increase, with sub-Saharan Africa, the Arab States, south Asia and Europe particularly affected.

This view seems to contradict most models of climate and general circulation. Studies of the south Asian monsoon reveal that it is driven by two principal forcing mechanisms, differential land-ocean sensible heating and tropospheric latent heating, both of which are based on prevalent solar radiation patterns. In addition, anomalously heavy snow cover over the Himalaya affecting Asian continental albedo and other factors have been identified with a weakened or delayed-onset of the monsoon.[12] Though many uncertainties remain, in accordance with these studies most recent atmospheric models show increased precipitation from the south Asian monsoon over most of its area of influence due to higher average atmospheric temperatures and the increased effects of solar radiation. As well, some modellers anticipate an increase in stochastic local variations of rainfall such as those in the Uttar Pradesh Hills and around the Gorakhpur region of east Uttar Pradesh this year.

On the whole and despite these inconsistencies this year's report is a welcome addition to the series of HDRs. It is particularly to be welcomed because for the first time it attempts to make a comprehensive critique of the impacts of human society's skewed consumption patterns on the global natural resource base, and of the implications of all these for human development. It is to be hoped that future reports in the series will further develop these concerns and thus play a greater role in identifying policies and practices suitable for creating sustainable patterns of consumption in industrial and developing countries.

Marxism and International Law
A Contemporary Analysis

B S Chimni

Changes in international law over the past two decades have made it an instrument for safeguarding transnational capital. International law today creates and congeals inequities in the international system. It reflects the domination of bourgeoisie which profits at the expense of working classes and disadvantaged groups in both the developed and developing countries. This article attempts to fill the gap left by Marxists' neglect of the study of international law. It calls for an international legal strategy that would form an integral part of a transnational counter-hegemonic project.

I
Introduction

INTERNATIONAL law is today playing an unprecedented role in creating and congealing inequities in the international system. The period after the second world war has witnessed the exponential growth of international law [1] No longer confined to questions of war and peace or diplomacy, international law has, on the one hand, come to govern the use of oceans and outer space, and on the other, regulate core aspects of national economic, social, and cultural life. Recent years in particular have seen the adoption of a network of laws which seek to establish the legal and institutional framework favourable to the accumulation of capital in the era of globalisation.

Generally speaking, three overlapping features can be said to mark the growth of international law in the last two decades. First, it is the principal instrument through which the rule of private property is being extended in the world economy. Second, it is the means through which the rights of transnational capital are being safeguarded, among other things, by prescribing uniform global standards – ignoring the phenomenon of uneven development – in key areas such as technology and foreign investment. Third, it guarantees the observance of these standards through endowing international institutions with the means to enforce them.

But despite the critical role international law has come to play in building and sustaining the contemporary international system Marxists have entirely neglected its study.[2] While an attempt was made in the former Soviet Union to articulate a Marxist approach to international law, its content was dictated less by Marxism-Leninism than by the need to rationalise Soviet foreign policy.[3] The principal task of Soviet international lawyers was seen as providing post facto justifications for the acts of omission and commission of the state in its external relations. No serious effort was undertaken to engage with bourgeois international legal scholarship in order to highlight the distinctive nature of the Marxist approach. Consequently, the field of international law still represents a wasteland insofar as Marxism is concerned. In this essay we make a preliminary attempt to fill the gap in the literature by reflecting on the condition of international law and institutions at the end of the twentieth century. However, the paper opens with a few theoretical considerations on the subject of historical materialism and international law.

II
Historical Materialism and International Law

The statement of a Marxist approach in any area of social science usually involves reference to, and exposition of, the relevant texts of Marx, Engels and Lenin. In the case of international law this is ruled out for the simple reason that they never directly addressed the subject. Instead, what follows is an attempt to apply the insights of Marxist methodology and sociology to the field of international law and institutions.

Four interrelated features may be said to characterise bourgeois international law writings. First, they offer a formal and technical definition of international law as comprising norms which govern the relations between states.[4] Bourgeois writings tend to study the phenomenon of international law in abstraction from international society, ignoring its specific features in various phases of history, its social content, and its corresponding forms. Second, bourgeois writers proceed on the assumption that the state stands above particular groups, interests and classes within a nation state. A key role of the state is said to be to regulate the conflicts between them in order to realise 'national interests' [Miliband 1977:66]. Together, these two assumptions facilitate the portrayal of international law as a neutral device which stands above states and classes, a depiction clearly belied by the history of international law and institutions. Albeit, the class content of modern international law has undergone transformation over the last three centuries of its existence. Third, bourgeois scholarship, like the dominant realist tradition in international relations, "is premised on the recognition of a fundamental disjuncture between internal political life which is carried on under the co-ordinating and pacifying sovereignty of the state, and external politics, which is governed by the irresistible logic of anarchy".[5] This makes it ignore the links between the internal organisation of a state and its external policies which it hopes to write into international law. Fourth, bourgeois writings fail to recognise the supranational character of capitalism and conceive the interstate system as a relationship between states which is independent of the functioning of the capitalist world economy.

In contrast to the approach of bourgeois scholarship four general overlapping propositions constitute the matrix within which a Marxist approach to international law is to be articulated. First, a Marxist approach to international law is inextricably related to its theory of international relations whose essence is in the final analysis determined by the manner in which states are internally organised. In the words of Marx and Engels (1976:38), "the relations of different nations among themselves depend upon the extent to which each has developed its productive forces, the division of labour and internal intercourse". Second, it follows, the foreign policy of a state is integrally linked to its domestic policy and is articulated and executed in the matrix of a specific socio-economic formation based on a definite and dominant mode of production. Of course in turn, as Gramsci noted (1971: 182), "international relations intertwine with these internal relations of nation-states, creating new, unique and historically

concrete combinations". Third, it rejects the abstract and vacuous concept of 'national interest' and contends that the state in its external relations does not seek to realise 'national interests' but rather the interests of particular groups and classes. Fourth, it does not view the contemporary international system as a mere sum of its parts but as possessing a distinct identity created by the supranational character of capitalism which is rooted in a world market and an international division of labour which together constitute the world economy.[6] Together these propositions point towards a perception of international law and institutions as a device which serves sectional global interests. The history of international law bears out this understanding.

The evolution and growth of modern international law is bound with the different phases of global capitalism. It is thus no accident that the different phases in the historical evolution of international law match the evolution of the world economy. In lieu of the fact that "capitalism from the very beginning has been imperialist" [Patnaik 1997:183], The history of the world economy may be divided into the following phases:

(1) 1600-1760	Old colonialism
(2) 1760-1875	New colonialism
(3) 1875-1945	Imperialism
(4) 1945-	Neo-colonialism

It is interesting that scholars of international law have arrived at the same break-up from a study of international legal sources. For example, Ian Brownlie (1984: 357-70) of Oxford University mentions the following phases: 1648-1750, 1750-1850, 1850-1950, and 1950-.

The different phases of the world economy yield appropriate international legal superstructures which can be classified thus:

(1) 1600-1760: Old colonialism – Transition from feudal to bourgeois international law.
(2) 1760-1875: New colonialism – Bourgeois (colonial) international law.
(3) 1875-1945: Imperialism – Bourgeois (imperialist) international law.
(4) 1945- : Neo-colonialism – Bourgeois democratic international law.[7]

Two clarifications are in order here. First, each of the phases of international law which has been identified is not an undifferentiated whole. For example, the neo-colonial period, dating from 1945, has seen both a progressive phase – a period which saw the decolonisation process unfold and the adoption of texts such as the Programme and Declaration of Action on the New International Economic Order (NIEO) and the Charter of Economic Rights and Duties of States (CERDS) - and a regressive phase dating from 1975. It is fascinating that the conclusions from a review of legal materials again coincide with that of dependency scholars like Samir Amin (1994:106) who also identifies 1975 as the turning point in that the third world returned to playing a comprador role abandoning bourgeois nationalist projects.[8] The year also saw the defeat of the upward trend in resistance in the advanced capitalist world which started in France in 1968 [Callinicos 1996: PE-11]. Likewise, beginning with the subversion of the Allende regime in Chile, repressive states in the third world, with the backing of imperialism, launched a fierce attack against working class movements [for a detailed review see Petras and Vieux 1994: 1-34]. It is this setback which facilitated the move from nationalism to pragmatism.[9] The regressive phase has itself seen, since the early 1980s, the restructuring of international law and institutions to facilitate the globalisation process.

Second, in stating that the different phases of the world economy have yielded corresponding superstructures of international law the idea is not to offer a deterministic and unidirectional interpretation of the evolution and growth of international law. While it does suggest that international economic relations have in crucial ways shaped the international legal system it does not contend either that the particular content and form it assumes is directly determined by it or that it does not in turn influence processes and events in international affairs. The Marxist categories of base and superstructure do not allow this complex reality to be captured. Three points may be made in relation to the contemporary international legal system.

First, productive relations regulated by law are in part meaningful only in terms of their definition in law. Marx himself stressed the fact that the property relation stands in such close contact with the existing relations of production that it "is but a legal expression for the same thing" [Pashukanis 1978:91]. In the case of international law the regulation of productive relations is, it is true, mediated by internal law. But it would be a mistake for this reason to represent all international law as ideology for it can directly control the content of internal law.[10]

Second, the international legal system possesses its own internal structure and dynamics which shapes its content and discourse.[11] It develops, for example, only through certain recognised 'sources of international law'.[12] The particular form international law thus assumes defines its boundaries; anything falling outside it is designated as non-law. Its distinctive nature has served to sustain the status quo and prevent the substantive transformation of the content of international law in favour of third world states.[13] For example, it has allowed near unanimous resolutions repeatedly passed by the UN General Assembly on restructuring international economic relations to be designated as 'soft law' since resolutions of international institutions are, among other things, not listed as a source of international law [Bedjaoui 1979]. Thus, as Bedjaoui (1979:99) has noted, "only the form of a legal concept is considered, while its content – the social reality it is supposed to express – is lost sight of".[14] The specific characteristics of its form also give it the appearance of neutrality. For instance, treaties are in the contemporary international system arrived at between parties who, vide the principle of state sovereignty, are equal in the eyes of international law. This principle of formal equality tends to automatically inject an international agreement with the elements of fairness and equity. Whereas, in reality the substantive inequality of parties almost always shapes the content of the agreement.[15]

Third, once international legal rules are adopted they possess a degree of autonomy from the states which have agreed upon them. While power plays a crucial role in shaping the content of the law, it imposes serious constraints on the behaviour of states once it comes into existence. A whole range of international (and national) mechanisms are in place to compel compliance with international obligations. The task of international institutions set up to ensure observance of rules is not the defence of the interests of individual powerful states but rather to safeguard the interests of a coalition of dominant global social forces and states. Thus, even the most powerful actor in the international system has to justify its actions with reference to international law. The fear of undermining the legitimacy of the international legal system through suggesting at all times that there is one law for the powerful and another for the weak also refrains dominant states from openly flouting the authority of international law and institutions. While such a dual structure characterised colonial and imperialist international law its open assertion is no longer acceptable. To put it differently, the idea of rule of law is not a vacuous one in the contemporary international system. It is not merely an ideological device which is manipulated by powerful states to their advantage. It has real significance. In this regard it is often forgotten that the idea of rule of law has come to be embedded in the international system through the historic struggles of colonial peoples for independence as also democratic forces within the former metropolitan countries. To dismiss the idea of rule of law then is to belittle these struggles and to fail to understand that it was far from being the

reality for centuries in the sphere of international relations. Of course, it would be equally mistaken to forget that international law and institutions serve the interests of the dominant social classes and states in the international system. Formal equality in it goes hand in hand with material inequality, and democratic principles and norms with neo-colonialism. In this essay it is this latter dimension of international law which is elaborated. In the sections to follow we review, at both the economic and political levels, the recent developments in international law and institutions which manifest the policies of neo-colonialism in the era of globalisation. However, for a correct portrayal of international law, and in order to avoid legal nihilism, both the aspects need to be borne in mind.

III
Globalisation and International Law-I

International law and institutions are today being transformed to facilitate the process of globalisation. Globalisation may be said to refer "to the shift of the principal venue of capital accumulation from the nation-state to the global arena" [Teeple 1997:15].[16] There is, as Teeple points out, "an historical parallel to the present shift":

> The development of national forms of capital in the 18th and 19th centuries required the destruction of local and regional jurisdictions. Numerous differences in laws, standards, currencies, weights and measures, taxes, customs duties, political and religious rights and privileges made trade and commerce over a large geographic area extremely difficult. Just as these barriers to the expansion of capital had to be overcome to make the modern nation-state, so today the systems of governance in the nation-state have to be dismantled in order to remove the barriers to accumulation for global corporations. It follows that laws, regulations, standards, and governing agencies since World War II have been and continue to be reconstituted at the global level [Teeple 1997:16].

Since the early 1980s, the advanced capitalist world has, under the guidance of the hegemonic transnationalised fractions of its national bourgeoisies, and with the assistance of the transnationalised fractions of national capital in the third world, pushed through a series of changes in international economic law which lay the legal foundation for capital accumulation in the era of globalisation [Robinson 1996:13-31]. These changes appear to have two principal objectives: (i) to extend and deepen worldwide the rule of capital through the removal of 'local' impediments; and (ii) to dismantle international laws of distribution which are based on the principle of market intervention. We identify below the different measures which have been taken in the world of international law to translate these objectives into reality.

(A) Extending and Deepening the Reign of Capital

A series of developments in the past two decades have sought to deepen and extend the reign of capital.

First, reference may be made to the privatisation of the public sector in the third world. This objective is being achieved through the instrument of international monetary law which legitimises and enforces conditionalities imposed by international financial institutions.[17] As has been pointed out, "forced privatisation was the standard feature of all structural adjustment programmes" [Hoogvelt 1997: 138,172]. By 1992 more than 80 countries around the world had privatised some 6,800 previously state-owned enterprises, mostly monopoly suppliers of essential public services like water, electricity, or telephones [Hoogvelt 1997:138].[18]

Second, a growing network of international laws seek to free transnational capital of all spatial and temporal constraints. The trend towards strengthening the rights of foreign capital, initiated in the mid-1970s (the move from nationalism to pragmatism), continues unabated. The concerns of transnational capital have been met through the establishment of a Multilateral Investment Guarantee Agency (MIGA)[19] and through concluding bilateral investment protection treaties (BITS) between the industrialised and the third world countries.[20] By 1996 more than 1,000 BITS had been concluded, mostly between the industrialised world and the third world countries [Schrijver 1997:191]. More recently, there have been the agreement on Trade Related Investment Measures (TRIMs) and the General Agreement on Trade in Services (GATS) adopted as a part of the GATT Final Act of the Uruguay Round of Trade Negotiations (hereafter the 'Final Act'). If these texts are examined in conjunction with the World Bank Guidelines on Foreign Investment (1992)[21] and the proposed OECD multilateral agreement on investment (MAI), the basis on which a global MAI is to be negotiated in the World Trade Organisation (WTO),[22] it becomes clear that the trend is towards removing all fetters on the entry, establishment and operations of capital. This is confirmed further by the September 1997 statement of the IMF Interim Committee – issued at the behest of what Bhagwati has called the 'Treasury-Wall Street-IMF Complex' – endorsing a move towards capital account convertibility despite all evidence showing the grave consequences for the economies embracing it (ibid). This is in contrast with original obligations contained in the 1944 Articles of Agreement which called for the "avoidance of restrictions on payments for current transactions" [Bhagwati 1998: 7-12]. What is of significance is that while the noted texts confer or hope to bestow a number of rights on transnational capital they impose no corresponding duties on them. Indeed, the Draft Code of Conduct on Transnational Corporations which imposed certain duties – respect for host country goals, transparency, respect for environment, etc – has yet to be adopted. Finally, the UN Centre for Transnational Corporations which was bringing some transparency to the functioning of TNCs was shut down in 1993.

Third, the global technology regime has been privatised.[23] The adoption of Agreement on Trade related Intellectual Property Rights (hereafter the TRIPs Text) as a part of the GATT Final Act has been a crucial step in this regard with its preamble baldly stating that "intellectual property rights are private rights" There is little justification for such a pronouncement. Indeed, a review of the literature on intellectual property rights (IPRs) reveals that such a view is difficult to sustain [Chimni 1994:315-33]. As one noted expert has put it,

> the language of property is ill considered here ... Knowledge is not a scarce resource. It is infinite in time and space. It can be used by all without depleting its value. In fact, the more it is used, the more valuable knowledge often is. Allocating property rights in knowledge makes ideas artificially scarce and their use less frequent—and from a social viewpoint, less valuable [Waver 1994:259].

The history of the negotiation of the international patent regime in particular is extremely interesting. Between 1980 and 1985 four international conferences were called under the auspices of WIPO to negotiate changes to the Paris Convention on Industrial Property, 1883. The Paris Convention, which can be termed an empowering document when compared to the TRIPs Text – it leaves to individual member states to define the subject matter of patentability, the duration for which a patent is to be granted and the scope of rights of patent holders – was sought to be revised in order to take into account the concerns of third world countries. But a year later, in 1986, the GATT Uruguay Round of Trade Negotiations was inaugurated in which the Paris Convention was revised in the reverse direction of strengthening the hands of patent holders *vis-a-vis* states in the poor world. The TRIPS Text gives more rights to patent holders, mostly transnational corporations

(TNCs), disregarding the fact that it will have grave consequences for the health of the poor in the underdeveloped world through sharply raising the prices of drugs, including essential life saving drugs, that are already beyond the pocket of the poor [Chimni 1993; 1994]. The absurdity of the TRIPs Text is revealed by the mere fact that it requires countries ranging from Rwanda and Nepal to the US and the UK to legislate the same patent regime. Thus, a principal objection of the third world countries to the TRIPs Text was that a global uniform patent regime did not allow individual countries the freedom – a privilege exercised by the industrialised countries to advance their own technological development – to adopt patent regimes in accordance with the development interests of the individual countries [Ricupero 1990:198-99]. They of course also questioned individual provisions whose substance is to subvert the goal of technological self-reliance that countries like India and Brazil are pursuing [Chimni 1994; Bifani 1990; UNCTAD 1991; Patel 1989; Nair and Kumar 1994]. The response to the resistance offered was the invocation of the US Omnibus Trade and Competitiveness Act, 1988 under which sanctions were threatened against countries unwilling to bring their IPR regime in line with its demands. Finally, like in the instance of transnational capital few duties are imposed on the technology or patent holder in the TRIPs Text. The only text to do so, viz, the Draft Code of Conduct on the Transfer of Technology has yet to be adopted despite being a subject of negotiations for more than two decades.

Fourth, the global commons have been subjected to the process of privatisation. Consider the developments in the Law of the Sea which regulates the use of the oceans. In 1982, after a decade of negotiations, the Third United Nations Conference adopted the Law of the Sea Convention. It was widely welcomed by the international community – despite the scepticism of some of us – as a legal regime which was fair to all the participants. Under the convention the principle of common heritage of (hu)mankind applies to the non-living resources of the ocean floor and its subsoil beyond the limits of the Exclusive Economic Zone (extending to 200 miles) and the Continental Shelf. It is to be operationalised through a parallel regime which requires (vide Article 153) every exploitable site to be divided into two parts, one for the mining company that has made a claim, and the other for UN's Enterprise, the operational arm of the International Sea-Bed Authority established by the convention. Writing in 1982 we had contended that the revolutionary concept of common heritage of mankind harboured reactionary content as it essentially envisaged the private exploitation of the resources of the seabed beyond national jurisdiction [Chimni 1982:407-12]. But such criticism was rejected as the parallel regime envisaged the transfer of technology from private mining consortiums to the enterprise. In 1994, through a subsequent agreement, the obligations relating to the transfer of technology were however dropped [Schrijver 1997: 191]. What is more the operations of the Enterprise have been constrained in other ways.[24] Thus, as one observer puts it, "the ... international law with respect to the global commons remains dominated by the rights of corporate property" [Teeple 1997:32].

Fifth, the idea of the global commons is sought to be extended by the industrialised world to the environment, including resources (e g, forests) which are located within the territory of third world countries [Imber 1994:58ff]. In addressing the issue intertemporal considerations are not given due weight implying a change in the distribution of property rights to the detriment of the third world countries. For "as industrial countries developed, global private rights were granted to polluters; now, developing countries are asked to agree to a redistribution of those property rights without compensation for already depleted resources" [Uimonen and Whalley 1997:66]. This 'redistribution' of course goes hand in hand with an IPR regime which makes environment friendly technology costly to access. On the other hand, there is a push to universalise northern regulatory norms since they promote the interests of transnational capital: the leading 50 environmental corporations in the world are located in the advanced capitalist countries [for details see Pratt and Montgomery 1997: 75-96].

Sixth, there have been established alternative dispute settlement mechanisms which seek to eliminate the role of national courts in resolving disputes between TNCs and the state. Today, international commercial arbitration is the preferred mode of settling disputes for TNCs. Since the late 1970s there has been a tremendous growth in the number of arbitration centres, arbitrators and arbitrations [Dezelay and Garth 1996]. "By the mid-1980s", according to a close observer, "it had become recognised that arbitration was the normal way of settlement of international commercial disputes" [Lalive 1995:2]. International commercial arbitration, it needs to be underlined, is essentially a private interests regime in which parties have 'autonomy' in terms of the selection of the arbitrators, the substantial law to be applied, and the place of arbitration. Support for it rests on a certain assumption of the proper sphere of state activities. In fact it reproduces the public/private divide in international law. Community policy comes into play only at the time of enforcement of an award and that too in the exceptional circumstance that the 'public policy' of a state has been violated, a concept increasingly narrowly interpreted. While, without doubt, international commercial arbitration has a significant role to play in routine cases involving international business transactions, it is not a suitable method for resolving disputes in core areas of national economic life like, for example, the exploration and exploitation of natural resources [Sornarajah 1991:79]. Third world countries were therefore for long suspicious of international commercial arbitration (ibid). For despite claims to the 'autonomy' of parties only a select and elite group of individuals serve as international arbitrators and the law applied is invariably traditional (colonial and imperialist) international law with its clear bias in favour of capital (ibid). But institutions pursuing the interests of capital (the World Bank and the International Chamber of Commerce, for example) have relentlessly promoted international commercial arbitration.[25] The increasing competition in recent years between third world countries to promote foreign direct investment has helped this effort as it has pressurised them to accept the preferences of TNCs in dispute resolution.

(B) Remaking the International Laws of Distribution

Accompanying the network of laws which extend and deepen the reign of capital have been attacks on principles and agreements which attempted to inject, as a part of the effort to usher in a NIEO, the traditional international law of distribution with elements of equity and justice. Two examples would suffice First, is the rejection of the special and differential treatment (SDT) principle which calls for preferential treatment to be given to third world countries. Beginning with the late 1950s, the industrialised world had, under pressure from the newly independent countries – its institutional expression being UNCTAD and the Group of 77 – grudgingly accepted the SDT principle. For example, in 1966 GATT was amended to include Part IV of the agreement (entitled 'Trade and Development') which sought to give expression to the SDT principle. While it did not place hard legal obligations on the industrialised states they were compelled to accept a formal commitment to the SDT principle. Pursuant to it a voluntary Generalised System of Preferences (GSP) scheme was launched in 1970. It was introduced under the auspices of UNCTAD

for the industrialised countries strongly resisted "giving the GSP the form of an amendment to Article 1 of the General Agreement [the MFN clause] and thus ensured the maintenance of the juridical status quo" [Berthoud 1985:78]. The GSP scheme brought little benefit to third world countries [Nicolaides 1995:309]. Beginning with the late 1970s the principle itself came under attack and attempts began to dilute even the soft law commitments. In the GATT Tokyo Round of Trade Negotiations which concluded in 1979, the industrialised world pushed through, despite the opposition of the poor world, a decision which introduced the notorious graduation clause into the SDT principle [GATT 1980:203-05]. A few months before the conclusion of the Tokyo Round the Group of 77 had issued a declaration in UNCTAD in which they expressed their "rejection of the concept of 'graduation' ... which would allow developed countries discriminate among developing countries in a unilateral and arbitrary manner" [Berthoud 1985:83]. It however failed to persuade the industrialised countries. The biggest blow came in the Final Act of the Uruguay Round when a number of agreements and understandings adopted drastically curtailed the grant of SDT. In the balanced language of Trebilcock and Howse, while the Final act "reflect[s] developing country concerns in a number of areas, the tendency has not been to grant developing countries broad exceptions to compliance with GATT rules. In some instances developing countries may be given a somewhat longer period of time to phase in domestic compliance with the new rules, but the Uruguay Round result reflects, in large measure, a rejection of the view that developing countries should not be required to make reciprocal commitments to trade liberalisation" [Trebilcock and Howse 1995:324]. The new texts adopted on key provisions like Article 18-B, the safeguard clause and subsidies represent a clear set back for the SDT principle.[26] Its dilution has been justified in the name of deepening the integration of the third world countries in the world economy and on the belief that "the insistence of on S and D and the refusal to engage in reciprocal negotiations meant that the benefits of GATT membership was substantially reduced" [Hoekman and Kostecki 1995:244]. In actuality, the denial seeks to squeeze the space for independent self-reliant development of third world countries.

Second, dating from the arrival of the Reagan and Thatcher administrations in the US and UK respectively, an all out attack was launched on international commodity agreements (ICAs) whose primary aim is to stabilise the prices of primary commodities by intervening in the world market through the use of export quotas and/or buffer stock mechanisms [Chimni 1987:ch 3]. It may be recalled that the NIEO programme of action had recommended the "expeditious formulation of commodity agreements" and CERDS had stated that "it is the duty of states to contribute to the development of international trade in goods" through concluding ICAs [ibid:3-4]. These instruments were however represented by the Reagan and Thatcher administrations as distorting free markets. The timing of the offensive was impeccable. It came at a point when primary commodity prices were at the lowest since the great depression.[27] The unfortunate collapse of the Fifth International Tin Agreement in 1985 was used to completely discredit the instrument of ICAs disregarding their role in ensuring a more equal distribution of gains from the sale of raw materials, as also the fact that the idea of free market was a myth [ibid:197-212]. What the industrialised world wanted to ensure was that prices of primary commodities remained low through staving off intervention in markets through ICAs. It both increased the profits of capital as also allowed the industrialised world to tackle the problem of inflation at home. While in the beginning of the 1980s there were five ICAs in operation (covering cocoa, coffee, natural rubber, sugar and tin), at the end of the decade only one was in existence. On the other hand, by the early 1990s the average level of non-oil commodity prices was "the lowest for over a century" [Maizels 1994:54]. By 1991 "the total terms of trade loss on all non-oil commodity exports from developing countries amounted to about $60 billion..." (ibid). Over the period 1980-91 "the cumulative loss totalled some $290 billion" [ibid:56].

Yet the hostility to ICAs did not cease. Rather, the end of the cold war eliminated the strategic considerations for supporting ICAs. The US had started supporting ICAs in the early 1960s only in the wake of the Cuban revolution. The Latin American Task Force set up by president Kennedy, concerned at the spread of 'Castroism', had *inter alia* recommended that the US co-operate in establishing co-operative arrangements in order to reduce the potential political consequences of violent fluctuations in the prices of Latin America's exports [Fisher 1972:27]. In March 1961, in his famous Alliance for Progress Speech, president Kennedy stated that the US was ready to 'co-operate with the Latin American and other producer country governments in a serious case-by-case examination of the major commodities and to lend its support to practical efforts to reduce extreme price fluctuations" [ibid:28]. Thus, the collapse of 'actually existing socialism' has taken away the principal reason for the support of ICAs by the US.

IV
Globalisation and International Law-II

The changes which have been introduced in international economic law have been accompanied by an emerging international 'political' law which *inter alia* seeks (i) to legitimise a system of global apartheid in a bid to preserve unbelievable privileges for a section of citizens in the advanced capitalist countries. In this regard international law rules have been rewritten to limit voluntary and forced migration to the west [Richmond 1994]; and (ii) to promote "low intensity democracies" in the third world to sustain favourable conditions for foreign investment. New international law norms are being established to promote 'democratisation' and 'good governance' in order to confer legitimacy on collaborating regimes at a historical juncture when authoritarian regimes no longer need to be supported, as in the past, to fight communism. These two developments are analysed in some detail below.

(A) Toward an International Law of Exclusion: Asylum under Threat

While capital and services have become increasingly mobile in the era of globalisation, labour has been spatially confined despite the urgings of consistent free trade economists [Bhagwati 1989: 243-44]. But what is even more disturbing are recent developments in the advanced capitalist world in relation to the institution of asylum [Chimni 1994; 1995a]. For here we are talking of the forced migration of people, i e, of individuals and groups fleeing untold misery and suffering. Since the early 1980s there has been a concerted attempt by the western countries to dismantle the liberal international refugee regime which was established after the second world war. In particular, the post cold war era has seen a whole host of restrictive practices being put in place to prevent refugees fleeing the underdeveloped countries from arriving in the west.

The international refugee regime was from the beginning a product of the cold war. It was seen as an instrument with which to embarass the former Soviet Union and its allies. "The refugee definition was carefully phrased to include only persons who have been disfranchised by their state on the basis of race, religion, nationality, membership of a particular social group, or political opinion, matter in regards to which East bloc practice ha[d] been historically been problematic" [Hathaway 1991:8]. The import of the definition

becomes clear from, among other things, the fact that nearly 95 per cent of refugees given asylum in the US in this period came from the former communist bloc countries [Robinson and Frelick 1990: 298]. The end of the cold war meant that the refugee lost both ideological and geopolitical value. Identified below, albeit in a summary fashion, are a few of the legal measures and interpretations which have been mobilised for the containment of refugees in the last two decades.[28] They violate either in letter or in spirit the UN Convention on the Status of Refugees, 1951 to which all the western states are parties.

First, there are the restrictive visa policies and carrier sanctions: the latter making airline carriers liable to fines for carrying passengers without proper papers. Second, 'international zones' have been demarcated in airports where physical presence does not amount to legal presence and from where summary and arbitrary removal is permissible. Third, safety zones have been created inside countries – as in northern Iraq and former Yugoslavia – to stop asylum seekers moving out and seeking refuge. As it turned out, these safe zones were the most unsafe you could imagine [Chimni 1995b: 823-54]. Fourth, the fundamental principle of non-refoulement, enshrined in Article 33 of the 1951 UN Convention, has been given an extremely narrow interpretation. According to the principle of non-refoulement "no refugee should be returned to any country where he or she is likely to face persecution or torture" [Goodwin-Gill 1996:117]. An example of an extremely retrogressive interpretation is the decision of the US Supreme Court in Sale v Haitian Centres Council [113 S Ct 2549 (1993)]. In it the US Supreme Court decided that the act of interdicting Haitian refugees on the high seas and returning them to their country of origin irrespective of the claims to having a well founded fear of persecution was not violative of Article 33 of the 1951 Convention. This decision met with near universal disapproval and has been described by the high commissioner for refugees as "a setback to modern international refugee law". Fifth, most countries in Europe, and the US since April 1, 1997, are implementing the 'safe third country' concept whereby an asylum seeker is denied access to a comprehensive asylum determination procedure because they could apparently have sought protection in countries they passed through to reach their ultimate destination. The concept has grave consequences for the asylum seeker as it has led to chain deportations, often back to the country from which the refugee fled. In an unfortunate decision the German Federal Constitutional Court in May 1996 upheld the German safe third country law legitimising its practice in other countries as well. A recent report of the United States Committee on Refugees (USCR) – a privately funded public information programme of Immigration and Refugee Services of America – has however recommended that "the use of national safe third country national laws and practices should be discontinued immediately" [US Committee for Refugees 1997:32]. Sixth, still on the same theme, mention may be made of attempts to harmonise internal procedures in Europe which has led to the adoption of two conventions known as the Dublin and Schengen Conventions which have recently come into force. The USCR has also recommended the scrapping of these conventions insofar as the criteria used for determining claims of asylum seekers is concerned. It recommends that "the country where the asylum seeker first chooses to seek asylum, rather than the country of first arrival, should normally assume responsibility for adjudicating the asylum claim" (ibid). Seventh, asylum seekers have been held in offshore camps which have been effectively declared rights free zones. For example, when the US started holding Haitian and Cuban refugees at Guantanamo Bay, a territory leased out from Cuba, a US Court of Appeals ruled in Cuban American Bar Association (CABA) v Christopher [43 F 3d 1412 (11th Cir 1995)] that refugees in 'safe haven' camps outside the US did not have constitutional rights of due process or equal protection, and were not protected against forced return. This is, according to Bill Frelick of the USCR, "an open invitation for abusive and arbitrary conduct". Eighth, where an asylum seeker manages to cross these hurdles a very restrictive interpretation is given to the definition of 'refugee' contained in the 1951 Convention. For example, asylum seekers fleeing former Yugoslavia, most of whom met the 1951 Convention definition, have been denied refugee status. Some countries (Canada, for example) have also invoked the internal flight alternative (IFA) test to deny refugee status. Together, these interpretations and measures manifest a language of rejection which threatens the very institution of asylum. They epitomise the international law of exclusion.

(B) Polyarchy, Intervention and International Human Rights Law

It has however not prevented the advanced capitalist world from mobilising international human rights law to support global economic expansion without committing itself to the pursuit of equity in its international economic relations.

First, a particular perspective on international human rights law has been advanced to support the idea of 'low intensity democracy' or 'polyarchy' with the idea of legitimising internal orders which favour foreign investment and provide stable social and political conditions for its operation [Evans 1997:99]. Polyarchy refers "to a system in which a small group actually rules and mass participation in decision-making is confined to leadership choice in elections carefully managed by competing elites" [Robinson 1996:49, 57]. Under it "a system can acquire a democratic form without a democratic content" [Ibid; see also Evans 1997:98-99]. International law experts like Franck claim that there is an emergent right to democratic governance linking the legitimacy of governments with 'free and fair' electoral processes [Franck 1992:46; Fox 1992:539; Teson 1995:91-92]. This limited concept of legitimacy suits the interests of transnational capital which is keen to see the rule of law prevail without it translating into the participatory rights of people.[29] It is therefore no accident that despite accepting at a formal level the fact that economic and social rights have the same significance as political and civil rights the industrialised world has done little to put this view into practice on the international plane. For example, the right to development was declared by the UN General Assembly in 1986 as 'an inalienable human right'.[30] But little has been done to give substance to the right. If anything attempts have been made to empty it of content. The SDT principle is said to be "central to a new international development law" and "at the heart of a new legal method" to inject an element of equity in international economic relations [Carty 1993:88]. But the SDT principle, as we saw, has been given short shrift in the GATT/WTO regime. Further, the advanced capitalist world has authored the structural adjustment policies being implemented by the international financial institutions which have led to the massive violation of the economic and social rights of the working peoples of the underdeveloped world [Bello 1994; Cornea 1992; Development Gap 1993; Ghai 1991; Cornea, Jolly and Stewart 1987].

Second, in the matrix of international human rights law a right to humanitarian intervention has been shaped which legitimises intrusions in the sovereign political space of third world countries. To put it differently, where 'low intensity democracies' collapse ('failed states') the industrialised world has given to itself the right to intervene (often through the UN) to restore 'polyarchy'. As Orford has noted, in this view "collective humanitarian intervention is legitimate if it ensures that the criteria of formal procedural democracy are met even in sharply polarised societies where large groups are excluded from decision-making power" [Oxford 1997:

461]. Powerful northern states also use the language of human rights for the moral condemnation of states which are not low intensity democracies ('rogue states') to take punitive action against them. In the Nicaragua case the International Court of Justice held that it "cannot contemplate the creation of a new rule opening up a right to intervention by the one State against another on the ground that the latter has opted for some particular ideology or political system". ('Case Concerning Military and Parliamentary Activities in and Against Nicaragua', Nicaragua v United States of America, *ICJ Reports*, 1986, para 283.) However, in recent years, precisely such a right of intervention is being shaped in the matrix of human rights law [for justification see Teson 1988].

V
Globalisation and International Institutions

In the corpus of literature which constitutes international legal studies there is little reflection on the role of international institutions in sustaining a particular vision of world order. While international law experts have concerned themselves with international institutions, the discussion has largely been confined to the rules of law which govern their legal status, structure and functioning, with matters of power and influence left to political scientists.[31] This is in contrast to the significance of 'international state apparatuses' (ISAs) in any national context. The ISAs serve, as Fine and Harris have pointed out, several functions. First, they help mitigate inter-imperialist rivalries. This does not mean international institutions remain neutral to these rivalries. Rather "they will be constructed and forced to promote the internationalisation of capital according to the relative strengths of different blocs of capital in competition ..." [Fine and Harris 1979:154]. Second, they help implement imperialist domination through the international control of finance, tariffs, etc. Third, "the working classes of all national states can be disciplined and moderated in class struggle by the economic control exercised by these bodies, a control that is remote from the struggles at the point of production" [ibid:153]. In other words, according to Fine and Harris,

> ... there exists a complex structure of national and international capitalist state apparatuses, some of which are more distanced from the site of class struggles (the national social formation) than others. Those which are more distanced are more freely able to pursue the class interest and class positions of the dominant bourgeois fractions than is the national state. Because they have mechanisms (laws, treaties, agreements) for enforcing policies onto their constituent national states this structure of international institutions is able to exert what appears as an outside pressure on national states in favour of the interests of internationalised capital [ibid:160].

The Fine and Harris conclusions were perhaps not entirely appropriate for the time they were writing. In the 1970s international institutions still played a relatively peripheral role within the international system [Kirdar 1977: 24-25]. This was a time in which the third world countries were still avoiding going to the IMF as it imposed onerous conditionalities on the state, and the GATT was a long distance away from being transformed into the WTO, an octopus like organisation regulating critical areas of national economic life. But today, as one observer notes, "the 'commanding heights' of state decision-making are shifting to supranational institutions" [Robinson 1996:18].

The nature and character of these international institutions cannot be understood from within a bourgeois legal framework with its emphasis on formalism. In order to make sense of the functioning of international institutions we need to locate them within the larger social order, in particular the historical and political contexts in which they originate and function. Such an approach contends that only when a coalition of powerful social forces is persuaded that an international institution is the appropriate form in which to defend their interests is it brought into existence, albeit through state action, and it survives only if it continues to serve these interests [Murphy 1994:25, 44; Cox 1996]. The class which exercises the most influence in these institutions today is the transnationalised fractions of national bourgeoisies with the now ascendant transnationalised fractions in the third world playing the role of junior partners. These fractions do not seek in these institutions to actualise 'national interests' but rather act as "transmission belts and filtering devices for the imposition of the transnational agenda" [Robinson 1996:19].[32]

Three principal features characterise contemporary developments relating to international institutions. The first feature is the transfer of sovereign economic decision-making from nation-states to international economic institutions. Second, is the resistance to putting in place a decision-making process which is transparent and democratic. Third, is the gearing of the UN system towards promoting the interests of transnational capital, including increasing the role that the corporate sector can play within the organisation. Together, these features limit the possibilities of genuine democratisation of both inter- and intra-state relations. B[y] a contrary impression is sought to be creat[ed] through steering the knowledge productic[on] and dissemination functions of inte[r]national institutions; an ocean of literatu[re] is produced to justify their transforme[d] role.

(A) Expanding Role of 'Internationa[l] State Apparatuses'

The GATT/WTO regime best exem[]plifies the shift in power to 'internation[al] state apparatuses'. The GATT/WT[O] regime now regulates not merely trade i[n] manufactured goods but also trade i[n] agricultural commodities, 'trade relate[d] foreign investment, intellectual propert[y] rights and trade in services. Negotiation[s] are to begin under the auspices of th[e] WTO on other areas like the social claus[e] the trade-environment interface, and [a] multilateral agreement on investmen[t]. Guaranteeing the observance of the rule[s] in these diverse areas is the WTO disput[e] settlement system (DSS) backed by [a] system of sanctions. The usual lament tha[t] international law is not law as it lack[s] enforcement mechanisms does not appl[y] at least in the instance of the WTO.

In key areas of national economic lif[e] it will be the decisions of the DSS whic[h] will be final rather than, as in the past, th[e] decisions of the highest court within [a] nation-state. The DSS has been considerably strengthened under the WTO through the inclusion of several new features not present in the GATT system. The essence of these new features is to have disputes settled within a short time framework and to ensure that the impugned state abides by decisions delivered by the DSS.[33] A complex system of sanctions (including a system of cross-retaliation across sectors) has been put in place to make a recalcitrant state agree to obey the decisions of the DSS.[34]

It is true that the DSS has moved from a power oriented system under GATT to a rule oriented system in the WTO.[35] As Trebilcock and Howse note: "...the history of GATT dispute resolution has evinced a tendency towards greater reliance on a rule-oriented regime in resolving disputes" [Trebilcock and Howse:383]. They correctly point out that "the Uruguay Round Understanding on Dispute Resolution seeks to advance substantially the legal orders conception of the GATT" [ibid: 397]. To the extent that the new DSS reduces the role of power in arriving at solutions to international trade disputes it is certainly welcome. Surely, in a battle of briefs the less powerful countries have a better chance to have their views accepted than in negotiations which are openly visited by power.

However, the move to a rule of law model is placed in perspective if, first, the

DSS is evaluated in conjunction with the substantive agreements which constitute the Final Act. Since the rules they codify protect the interests of the industrialised states, in particular transnational capital, a rule oriented dispute settlement system only goes to enhance the inequities which they sanction. Second, the fact that unilateral sanctions continue to form a part of the system, as is reflected, for example, in the continuing use of super and special provisions of the 1988 Omnibus Trade and Competitiveness Act by the US, reveals that power continues to play a role in dispute settlement.[36] Third, where there is the possibility of the DSS seriously hurting the industrialised world attempts have been made to curb the move towards a rule oriented system. For example, special rules of interpretation have been included in the context of challenges to the imposition of anti-dumping duties (essentially used as a protectionist device by the industrialised states).[37]

The relocation of sovereignty that the DSS involves has been achieved without making the WTO in any way accountable to the peoples who inhabit the states whose actions it proposes to surveille and supervise. There is the absence of democratic participation in the law-making and dispute settlement process. Important elements of civil society – interest groups, civic organisations, and legislatures – are denied any role in it. The WTO DSS does not allow non-state involvement and is secretive in hearings and documentation. Thus, the WTO clearly needs to be opened up to wider participation; the executive arm of the state alone should not be allowed to represent the state [Kingsbury 1994: 8-9, 14-17, 34]. The democracy deficit the WTO suffers from is a big blow to the attempts of third world peoples to inject greater democracy in the functioning of the international system.

(B) Resistance to Democratic Decision-Making: The Case of IMF

The absence of democratic functioning also characterises the international financial institutions which have come to exercise unprecedented influence on the lives of ordinary people in the third world. The anti-democratic nature of its functioning is more primitive as here the problem is of allowing different groups of states equitable representation in the decision-making process of the organisation. To take the case of the IMF, the decision-making process in it is based on a system of weighted voting which excludes its principal users, the poor world, from a say in the policy-making.[38] The third world voice is not heard even as the policies of the Fund inflict enormous pain and death on the people who inhabit it [Bello 1994; Cornea 1992; Development Gap 1993; Ghai 1991; Cornea, Jolly and Stewart 1987].

In 1993, the IMF boasted of a membership of 175 countries. Of these 23 were developed countries, 17 were east European countries including eight states of the former Soviet Union, and the remaining 135 countries were third world countries, including six central Asian countries of the former Soviet Union. Nearly 4.4 billion people or 78 per cent of the world's 1990 population live in the third world [Gerster 1993: 121]. Despite constituting an overwhelming majority of the membership the third world countries as a whole had a voting share of 34 per cent in the IMF.[39] Without the OPEC countries (who act as creditor states in the institution) this share is reduced to 24 per cent.[40]

Since the 1960s the third world countries have been concerned with their lack of effective participation in the decision-making process in the Fund.[41] In the beginning their concern was essentially with the usurpation of the Funds' decision-making by the industrialised countries rather than the internal decision making authority [ibid:87]. But since the early 1970s a systematic challenge was launched to seek changes in the structure of Fund decision-making.[42] CERDS stressed the need for full and effective participation in the decision-making process of international economic and financial institutions.[43] From the outset the third world countries were ready to concede that a one state-one vote formula was unrealistic insofar as the Fund was concerned. Besides the question of power politics, the need to safeguard the revolving nature of the Fund, and the viability of allowing borrower countries to have a majority in an international lending institution, an important constraint was the non-usability for the most part of currency resources of the developing countries [Fergusan 1988: 100-02]. In other words, an increase in their quotas could mean a diminution in the lending capacity of the institution [ibid: 101].

The third world countries are therefore willing to give a functional interpretation to the principle of equality. Instead of insisting on equality of voting between states they emphasise on the relative equality among groups of states.[44] In other words, they wanted the third world countries as a whole to have an effective voice in the decision-making process [Fergusan 1988, 91-94].[45] This could be done by expansion of basic voting power and/or by establishing different criteria for establishing voting power other than the one used to determine quotas. For instance, by taking population into account.[46] There are many examples of using the concept of group as the basis for giving content to the principle of participatory equality of states [ibid: 104-06]. If accepted it would enhance the possibilities of effective participation of concerned states and increase the transparency of decisions, without taking away the dominant voice of the lender developed countries. Instead of looking to the long-term interests of the world economy in terms of the interests of the overwhelming population of the globe, the weak situation of the third world is being used to impose conditions which extend and deepen the role of private property and lead to the worsening of the conditions of the people. It is then understandable that the imperialist world resists the transformation of the decision-making process in a democratic direction.

(C) The Privatisation of the UN System

In the present period all international institutions are being mobilised in favour of promoting the interests of transnational capital. Mention needs to be made of the important role that the UN system is coming to play in the global privatisation process as also the moves to 'privatise' the United Nations system itself. The UN secretary-general has gone so far as to suggest that "the very concept of intergovernmentalism as we know it is being altered as a result of the redefinition of the role of government..." [Annan 1997:68]. In his speech to the World Economic Forum in February 1997 Annan announced that "strengthening the partnership between the United Nations and the private sector will be one of the priorities of my term as secretary-general".[47] This vision is built on the "new universal understanding that market forces are essential for sustainable development (sic)" [ibid: 1]. These pronouncements need to be read in the background of the shutting down of the Centre for Transnational Corporations, the fact that the UNCTAD has "repositioned itself" [Annan 1997:20] and the marginalisation of development issues in the UN system [South Centre 1996]. It becomes clear then that the agenda of the UN is being transformed from one supportive of restructuring extant international economic relations to one which is in the business of strengthening it. While it still continues to pay lip service to the global poor, its principal goal has come to be to promote the interests of private capital, both domestic and transnational, and make appeals to it to serve the cause of international justice.[48]

The promotion of the corporate sector is taking place even within the UN system. While there has never been any doubt about the policy tilt of the international financial institutions, private interests have come to influence a larger segment of the UN system. Lee, Humphreys and

Pugh have, on the basis of the analysis of three UN organisations (viz, International Telecommunication Union, International Maritime Organisation and International Tropical Timber Organisation), drawn attention to the fact that "private companies are increasingly influencing decisions and activities that are nominally the prerogative of governments" [Lee, Humphreys and Pugh 1997:339]. Further, under discussion are terms of reference for business sector participation in the policy setting process of the UN, as also partnering in the use of UN development assistance funds and in the pursuit of the goal of sustainable development [Korten 1997]. These developments may eventually transform the character of the UN from a public to a private organisation.

(D) Legitimation Functions of International Institutions

A key omission of international legal studies has been the failure to study the ideological role of international institutions.[49] The ideological or what may be termed the legitimation functions of international institutions assumes many forms. First, the organisation represents its institutional field and concerns to the outside world. Second, it actively promotes norms of international behaviour which facilitate the realisation of its objectives. Third, it frames issues for collective debate and proposes specific policy responses. Fourth, it identifies key points for negotiation in order to fill gaps in the normative framework and to adjust to changes in the external environment. Finally, it evaluates the policies of member states from the standpoint of their mandate and concerns. The knowledge production and dissemination functions of international institutions are steered by the dominant coalition of social forces and states to legitimise their vision of world order.[50] Only an oppositional coalition can evolve counter-discourses which deconstruct and challenge the hegemonic vision. This has been done in the past. For example, the entire debate on a NIEO was generated by the third world countries, with the support of the former Soviet Union, through either establishing institutions in which it exercised a dominant voice (like UNCTAD) or through a global coalitional politics which compelled the dominant states to listen to their voice in other institutions. The collapse of 'actually existing socialism', the crisis which has gripped third world economies in the past two decades, and the withering away of the Group of 77 has translated into the universal language of privatisation and markets. The forced consensus on this language needs to be urgently challenged.

VI
International Law, Hegemony, and the Use of Force

The dominance of powerful states in the international system is thus sustained not through the use of force but through having a certain conception of world order accepted as a natural order by the ruling classes and peoples of states over which dominance is exercised. However, when necessary, threats to the system are countered through the use of force. This force is invariably sought to be legitimised through the language of international law. While the threat or use of force is outlawed by the UN Charter (Article 2 para 4), it permits its use in self-defence (Article 51). There are also questions relating to the meaning of aggression, the use of force, and self-defence which create space for dubious interpretations. Since there is no compulsory third party settlement of international disputes in international relations there is no forum in which the interpretations advanced by dominant powers to justify the use of force can be challenged. Where it has been possible, as was the case when Nicaragua took the US to the International Court of Justice (ICJ), the US refused to comply with the decision. In fact in the Nicaragua case the US refused to participate further in the proceedings of the case as soon as the ICJ, overriding US objections, accepted to exercise jurisdiction. Indeed, piqued by its decision the US terminated its acceptance of the compulsory jurisdiction of the court [for a discussion see Chimni 1986: 960-70]. However, the ICJ went ahead and found the US "in breach of its obligation under customary international law not to intervene in the affairs of another state" and "not to use force against another state" [*ICJ Reports*, 1986, para 292]. It was also found guilty of violating the sovereignty of another state [ibid]. The US, of course, refused to abide by the decision of the World Court. Nevertheless, it underlined the fact that the idea of a rule of law in international affairs is not an empty one. It cannot be dismissed as a mere ideological device used by dominant states to maintain order in the international system. This is not to deny the originary violence which marks the present international legal system or the periodic violence unleashed on states and peoples which seek to challenge the prevailing consensus but to avoid falling into the trap of legal nihilism through a general condemnation of law and legal institutions.

The Gulf war, on the other hand, is perhaps the best demonstration of the thesis that the hegemonic powers will not shy away from the use of force when serious challenges are mounted to the system. In this case demonstrative force was used to defend the neo-colonial character of the existing international system.[51] As Said has observed with respect to the Gulf war "The entire premise was colonial: that a small third world dictatorship, nurtured and supported by the west, did not have the right to challenge America, which was white and superior. Britain bombed Iraq troops in the 1920s for daring to resist colonial rule; 70 years later the United States did it but with a more moralistic tone, which did little to conceal the thesis that Middle East oil reserves were an *American* trust" [Said 1993:295, emphasis in original]. During the course of the war the UN Security Council was treated as an extension of the US state department and the legal framework for Security Council actions shown scant respect [Anand 1994:5-17; Schacter 1991:45; Weston 1991:522]. In fact the UN Security Council abdicated its responsibility inasmuch as it had no control over what were ostensibly UN operations [ibid].

The force used was clearly disproportionate, and eventually directed at the fleeing enemy. International humanitarian laws were thrown to the wind [ibid:46ff]. Iraqi civilians were consciously made to suffer for reasons unrelated to the defeat, surrender, or weakening of the Iraqi military [Normand and Jochnik 1994:410]. The barbarian/civilised dichotomy which characterised imperialist international law came into play. Said has noted how the western media suggested that "Arabs only understand force; brutality and violence are part of Arab civilisation..." [Said 1993: 295]. It suggested that the western power "could go ahead and kill, bomb, and destroy, since what would be being attacked was really negligible, brittle with no relationship to books, ideas, cultures, and no relation either...to real people" [ibid: 298].[52] What is equally significant is what got left out: "What got left out was enormous. Little was reported on oil company profits, or how the surge in oil prices had little to do with supply; oil continued to be overproduced" [ibid:296; see also Fran 1992:3-22]. In brief, the conclusion suggests itself that like in the colonial period the laws of war are seen as imposing few constraints where the non-European world is concerned. As Bauman puts it, "since they are by definition violent, barbarians are legitimate objects of violence. Civility is for civil, barbarity for the barbaric" [Bauman 143]. It is hardly surprising therefore that the US has recently voted against the establishment of the international criminal court [*The Guardian Weekly* 1998:3].

VII
Conclusion

The aim of this paper was to draw attention to the crucial role international law and institutions have come to play i

the contemporary international system. With capitalism entering the phase of globalisation international law is playing a role akin to the one which internal law performed in the early stages of capitalism in removing local impediments to the process of accumulation. The international legal process is being used to control the content of national laws in crucial areas of economic, political, and social life, as also to relocate powers from sovereign states to international institutions in order to facilitate their surveillance and enforcement. These developments have considerably eroded the capacity of third world states to carry out independent and self-reliant development

For a period of time in the 1970s there was optimism that international laws could be transformed by a global coalition of third world countries to meet their particular concerns. An equitable international law of distribution was sought to be shaped through the adoption of the SDT principle and by promoting ICAs to realise just prices. Negotiations were also initiated to draft codes of conduct to regulate TNCs and the transfer of technology, and to revise the Paris convention on industrial property. Radical concepts such as the 'common heritage of mankind' were advanced in the process of arriving at rules to govern the use of the oceans. Attempts were made to democratise the decision-making process in the IMF and the World Bank. But these initiatives floundered on the rock of neo-colonialism. From the beginning of the 1980s, an increasingly hostile international economic environment saw the third world countries abandon the strategy of global coalition, hoping to separately encash their dependent status.

Meanwhile, capitalism entered the phase of globalisation. It was now the turn of the advanced capitalist countries to seek changes in the body of international law. These changes involved, first, the rejection of the proposals which had emerged in the 1970s in the form of a programme and declaration of action on NIEO and CERDS. Second, it called for the adoption of legal instruments to free transnational capital of spatial and temporal constraints. Third, an international law of distribution based on market ethics was given shape, eliminating all chances of injecting equity into international economic relations. Fourth, changes were initiated in the relevant international legal regime to enable the strict control of voluntary and forced migration. Fifth, international state apparatuses' were sought to be established to ensure the effective implementation of the rules which facilitate and promote accumulation in the era of globalisation.

These changes in the body of international law reflect the domination of the transnationalised fractions of the bourgeousie in the advanced capitalist countries. They have in this regard the active consent of their counterparts in the third world. The latter not only faithfully act as transmission belts for the ideas emerging from the advanced capitalist world but vigorously support it in a bid to profit from becoming junior partners in the global domination project. At the receiving end are the working classes and disadvantaged groups in the first and the third worlds. Their condition has seriously worsened in the last two decades.[53] On the other hand, as a result of the relocation of powers from nation-states to international institutions, the capacity of the left and democratic movements to resist developments which adversely affect their interests has declined [Robinson 1996:27]. If the global progressive forces hope to interrupt and thwart the reproduction of the relations of transnational domination then they must, among other things, think of ways and means to enhance their own role in the international law-making and law enforcement process. This calls for much greater attention to be paid to international legal developments than is being done at present. The international legal strategy must in turn form an integral part of a transnational counter-hegemonic project which, even as it continues to have its principal base in national struggles, comes to form transnational alliances in order to resist the vision of globalised capitalism.

Notes

1 "Perhaps the most important of the revolutions in the dimension of modern international law lies in its expanding scope, in the addition of new subjects to the field of international law" [Friedmann 1968].

2 Seven decades ago, in his preface to the second Russian edition of his book on law and Marxism, Pashukanis (1978:38) wrote that "...the Marxist critique has not even touched on such fields as that of international law yet" The situation is no different today

3 For a critique of the Soviet International Law approach as articulated by its chief spokesman G I Tunkin in the period after the second world war see Chimni (1993:chapter V)

4 Oppenheim, for example, defines international law as "the body of rules which are legally binding on states in their intercourse with each other" [Jennings 1992:4]. Modern textbook writers often extend the definition to include the relations between states and organisations and non-state entities, and in some respect individuals. For instance, Starke (1989:3) defines international law "as that body of law which is composed for its greater part of principles and rules of conduct which states feel themselves bound to observe, and therefore, do commonly observe in their relations with each other, and which includes also, (a) the rule of law relating to the functioning of international institutions or organisations, their relations with each other, and their relations with states and individuals; and (b) certain rules of law relating to individuals and non-state entities so far as the rights and duties of such individuals and non-state entities are the concern of the international community". However, Starke (1989:4) hastens to add that "from a practical point of view, it is well to remember that international law is primarily a system regulating the rights and duties of states *inter se*". But even the broader definition is a formal and technical definition. The general point was made long ago by Pashukanis [Bierne and Sharlet 1980:169].

5 Indeed, "exploring this logic of anarchy is held to be the distinctive task of IR theory – a task which must be kept separate from the study of domestic politics which is governed by fundamentally different principles" [Rosenberg 1994:4].

6 It, of course, raises the complex question as to whether the world economy is the basis of international law in the same way as the internal economic structure can be said to be the basis of internal law.

7 A central feature of bourgeois democratic international law is the universalisation of the principle of sovereign equality of states For a detailed account of these phases see Chimni (1993:224-36)

8 The irony was not lost on Amin "the 1975 turning point seemed striking to me because of the non-aligned movement and the Group of 77 proposal for a New International Economic Order".

9 After all, it was the struggles of the working class and other marginalised peoples which pushed third world elites to supporting radical moves on the international scene.

10 Post-structuralist scholars tend to fall into this trap. For example, David Kennedy of Harvard Law School writes: "Rather than a stable domain which relates in some complicated way to society or political economy or class structure, law is simply the practice and argument about the relationship between something posited as law and something posited as society" [Kennedy 1988:8].

11 In other words, insofar as international law is an ideological construct and possesses a distinct form, it also has an independent history. As Engels pointed out, "every ideology...once it has arisen, develops in connection with the given concept material further, otherwise it would not be an ideology, that is, occupation with thoughts as with independent entities, developing independently and subject only to their own laws" [Engels nd:372]

12 The sources of international law are seen as being articulated in Article 38 para (1) of the Statute of the International Court of Justice (ICJ). It reads

The court, whose function is to decide in accordance with international law such disputes as are submitted to it, shall apply:

(a) international convention, whether general or particular.. ,

(b) international custom, as evidence of a general practice accepted as law;

(c) the general principles of law recognised by civilised nations, and

(d) ...judicial decisions and the teachings of most highly qualified publicists of the various nations, as subsidiary means for the determination of rules of law.

13 As the present president of the ICJ has put it [Bedjaoui 1979:128], international law must "accept the challenge being made to it both by the structural disorder of the world economy and by the deeply felt desire of all peoples for

a new international economic order. However, it is perfectly clear that to satisfy such hopes and to meet the needs of the international community seeking for this new order, international law cannot properly and effectively undertake its own transformation if it confines to its traditional sources alone, i e, custom, treaties and general legal principles. The inadequacy of traditional ways of forming the rules of international law is very sharply felt at the present time. What is to be done if not to make use of other sources?"

14 Koskenniemi (1990:27) puts it this way: "the idea of an international Rule of Law has been a credible one because to strive for it implies no commitment regarding the content of the norms thereby established or the character of society advanced".

15 It is true that the distinctive nature of the international legal process in which sovereign states negotiate ensures that even a group of powerful states cannot translate their economic interests directly into law. Other states have to agree to undertake certain obligations and even puppet states possess a degree of independence in shaping their external relations. International economic relations, in other words, is not passively mediated by particular national economies. However, this does not on the other hand mean that power does not write its interests into law. It merely defines the limits of its role in the international legal process.

16 We recognise that 'globalisation' is an essentially contested concept [Hirst and Thompson 1995, Hoogvelt 1997] What we adopt here is a working definition which highlights its general feature

17 It is often forgotten that the IMF/WB combine achieve their goals through imposing legal obligations on states. International Monetary Law has evolved through, among other things, the interpretation of the Articles of Agreement of the IMF. According to Dam (1982.117) the history of interpretation of the Fund's Articles of Agreement is nothing more, and nothing less, than the record of the rules of the Fund". He then goes on to point out that 'perhaps the most interesting evolution has occurred with respect to those rules dealing with access to Fund resources and, in particular, what has come to be known in Fund parlance as conditionality' That term refers to the conditions that the Fund may impose on access to its resources and on their subsequent use by member countries " See also Gold (1984) At a later point in this article we discuss the anti-democratic nature of the decision-making process in the IMF.

18 Hoogvelt (1997 172) cites one senior World Bank manager who resigned after 12 years as stating: "Everything we did from 1983 onwards was based on our new sense of mission to have the south 'privatised' or die: towards this end we ignominiously created economic bedlam in Latin America and Africa".

19 MIGA insures foreign direct investments against non-commercial risks. For a summary see Petersmann (1988:50-62).

20 BITS represent a clear retreat from CERDS: the latter laid down a restrictive basis for the payment of compensation for expropriated or nationalised property.

21 The Guidelines recommend a 'general approach of free admission'. It then calls for 'fair and equitable treatment' of foreign investment. For the text of the World Bank Guidelines on the Treatment of Foreign Direct Investment see UN (1996:247-55).

22 On the MAI see Dhar and Chaturvedi (1998:837-50) and *The Guardian Weekly* 1998.

23 This is in contrast to the view that "technology is the archetypal common heritage of mankind since it is the expression of man's spirit, his boldness and his conquests, of the advance of science and human knowledge over the centuries and beyond state boundaries" [Bedjaoui 1979:231].

24 'During the period 1990-94, 15 meetings were convened which resulted in a Draft Agreement Relating to the Implementation of Part XI of the UN Convention on the Law of the Sea of December 10, 1982. On July 28, 1994, the General Assembly adopted the Agreement by 121 votes to none, with seven abstentions. The Agreement substantially accommodates the US and other western nations' objections to the deep sea-bed mining regime...It eliminates major stumbling blocks, such as a production limitation in favour of land-based producers of minerals, and mandatory transfer of technology and significantly restrains the role of envisaged supranational mining company, the UN Enterprise' [Scrijver 1997:217-18].

25 In 1965 the International Centre for the Settlement of Investment Disputes (ICSID) was established under the auspices of the World Bank. Those states which become members of ICSID agreed to have a dispute with a private entity settled before it

26 For example, Article 18-B allowed developing countries to impose quantitative restrictions to safeguard an adverse balance of payments situation This has now become difficult as the new understanding on Article 18-B tightens the rules governing its invocation. See Dubey (1996:85ff).

27 ..the general level of real commodity prices had fallen by 1986 to below the nadir reached in 1932 during the Great Depression of the inter-war era" [Maizels 1994:53].

28 This section borrows heavily from my article 'The Law and Politics of Regional Solution of the Refugee Problem: The Case of South Asia', *RCSS Policy Studies 4*, Regional Centre for Strategic Studies, Colombo, July 1998.

29 It has also been its experience during the cold war era that support for authoritarian regimes has inevitably led to a backlash which threatens foreign investment and property.

30 GA Res 41/128. The declaration was adopted by a recorded vote: 146-1(US)-8.

31 Schermers and Blokker (1995:4) in their well known work on international institutional law write that "the institutional law of international organisations comprises those rules of law which govern their legal status, structure and functioning" Schermers and Blokker go on to observe: "While, in the land of legal science, there is no strongly established tradition of developing theories of international organisations, this is different for the neighbouring discipline of political science...These studies, of course, approach international organisations from a different perspective; they pose different questions and use different methodology They are more interested in matters of power and influence, while legal studies depart from rules." (pp 8-9)

32 This agenda is resisted by what may be called the non-transnationalised fractions under the banner of 'nationalism'. Its critique of these institutions often coincides with that offered by left parties without, of course, partaking in the vision of establishing democratic socialism.

33 This is done through incorporating the negative consensus system Article 16.4 of the 'Understanding on Rules and procedures governing the Settlement of disputes' (DSU) states that a Panel Report would be adopted within 60 days unless one of the parties appeals the report or 'the DSB [Disputes Settlement Body] decides by consensus not to adopt the report' It means that even if a single state votes in favour of the adoption of the report submitted under the DSS it will be binding on the parties to the dispute

34 See Article 22 of the DSU for the provisions on cross-retaliation.

35 For a discussion on the two alternative paradigms see Jackson (1989:85-88)

36 Even before the conclusion of the Uruguay Round of Trade Negotiations and the establishment of the new DSS, Bhagwati (1988: 93, 105) had pointed out that the 1988 legislation represented "pernicious bilateralism" and that Super 301 is 'like Judge Dee of mediaeval China becoming the plaintiff, judge and jury'

37 "AD is simply a packaging of protectionism to make it look something different... AD is a major loophole in the GATT, used strategically by firms" [Hoekmann and Kostecki 1995: 177-78]. Further, by allowing a unilateral national response (anti-dumping duties or countervailing duties) the more economically powerful nations can have a considerable impact on smaller trading nations, while the reverse may not be true (Ibid: 243). Article 17 6 (ii) of 'Agreement on Implementation of Article VI' (the Anti-dumping Code) states that where "a relevant provision of the Agreement admits of more than one permissible interpretation, the panel shall find the authorities measure to be in conformity with the Agreement if it rests upon one of those permissible interpretations" As noted by Palmeter (1995), "a major goal of US user industries in the Uruguay round was to limit the ability of GATT panels to overturn domestic decisions. The standard of review embodied in the Agreement reflects the power of the industries supporting AD. The lobby was strong enough to make this specific issue a deal-breaker for the United States, and it obtained most of what it sought"

38 'The extent to which developing countries rather than industrialised countries are dependent upon the financial assistance from the IMF is illustrated by the fact that the last time IMF loans were drawn by any of the industrialised countries was in 1979, namely by Australia and New Zealand [Gerster 1993].

39 Despite the fact that the developing country membership has increased from 93 in 1970 to 135 in 1993 the voting power has decreased from 37 per cent in 1970 to 34 per cent in 1993 [Gerster 1993 122] The reason for this state of affairs is to be traced to the method of determining voting power By becoming a member each state acquires a basic voting power consisting of 250 votes. The rationale for distribution of basic votes was, other than paying homage to the principle of sovereign equality of states, the need to prevent, in however small a way, control of the institution by a few countries, an objective at that point articulated and shared by the US This role of basic votes has substantially eroded in the last five decades. While the membership of the

organisation has increased from 44 in 1947 to 175 in 1993 the proportion of basic votes to total votes has decreased from 12.5 per cent in 1947 to 3 per cent in 1993 (Ibid:123). In addition to basic votes each state receives a further vote for every 1,00,000 SDRs of its IMF quota, quotas are determined (at least in theory) in accordance with the importance a particular country has in the world economy, and thus its capacity to contribute to the convertible financial resources of the Fund The weight of subscription-based voting power, as would be evident, has increased from 87.5 per cent in 1947 to 97 per cent in 1993 It only needs to be added that decisions concerning stabilisation and adjustment programmes merely require an unqualified majority of 50 per cent.

40 This fact is of importance because countries like Saudi Arabia have most often the same interests as other creditor developed countries [Fergusan 1988:219]

41 The relative lack of concern in the period prior to that can be traced *inter alia* to the fact that the IMF "was peripheral to the broad operationalisation of international economic relations" [Fergusan 1988:84].

42 This was particularly after the unilateral decision of the US on August 15, 1971 regarding the convertibility of its currency and its negative impact on the third world countries (ibid 88 and 107)

43 Article 10 of the Charter stated: "All states are juridically equal and, as equal members of the international community, have the right to participate fully and effectively in the international decision-making in the solution of world economic, financial and monetary problems, *inter alia*, through the appropriate international organisations in accordance with their existing and evolving rules, and to share equitably in the benefits resulting therefrom".

44 On the notion of relative inequality see Zamora (1980:603) and Chimni (1987:95-98)

45 As Fergusan (1988:91) has noted, "In the Fund itself, by the end of the 1970s, they were arguing for a specific quantitative limit to the quantum of quotas they should be allotted, as a group They pressed for 45 per cent of Fund quotas"

46 In these regards see Gerster (1993:126-27) As Fergusan (1988:99) has noted: "There are three ways, theoretically, to effect adjustments in voting power in the IMF. The first way is by changing the quantum of basic votes granted by each member – an approach that necessitates an amendment of the Articles. The second way is to obtain changes in the criteria that are used for the allocation of quotas... And, finally, an improvement in the relative economic performance of countries has traditionally been rewarded by increased quotas in the Fund"

47 *UN Newsletter*, vol 52, no 6, February 8, 1997, p 2 See for a list of 'achievements' 'The UN and Business: A Global Partnership', *UN Newsletter*, New Delhi, vol 53, no 28, July 11, 1998, p 8

48 Indeed, transnational capital is able to influence the agenda-setting as was 'evident at the UNCED in June 1992'. According to Thomas, "transnationals played a formative role in shaping the Rio agenda, aided by their financial support for the conference, and the high-profile role and the access given to the Business Council for Sustainable Development by conference chairman Maurice Strong. At the behest of the US all references to transnational corporations were removed from Agenda 21" [Thomas:12].

49 According to Cox (1993:62), among the features of international institutions which express their 'hegemonic' role are the following: (1) they embody the rules which facilitate the expansion of hegemonic world orders; (2) they are themselves the product of the hegemonic world order; (3) they ideologically legitimate the norms of the world order; (4) they co-opt the elite from peripheral countries; and (5) they absorb counter-hegemonic ideas.

50 For an application of this understanding to the Office of the United Nations High Commissioner for Refugees (UNHCR) see Chimni (forthcoming).

51 This statement should not in any way be read to imply a defence of the actions of the Iraqi regime which clearly violated the norms of international law in invading Kuwait. Nor should it in any way be seen as excusing its terrible human rights record.

52 Said here makes reference to Fouad Ajami's article, 'The Summer of Arab Discontent', *Foreign Affairs*, vol 65, Winter 1990-91. See also [Aksoy and Robins 1992:202-13]. As they put it: "The war in the Persian Gulf was cast as a global confrontation between humanity and bestiality, a battle between civilisation and barbarism. This was a war to defend the principles of modernity of reason against the forces of darkness. It was in this cause that the smart weapons of the west meted out what was projected as a moral kind of violence In this cause, the angels became exterminators" (p 202).

How Good Are India's Industrial Statistics? An Exploratory Note

R Nagaraj

There is a growing perception of a steady deterioration of the quality of India's industrial statistics. Is this perception justified? To find out, this study examines the quality of the Index of Industrial Production, and some aspects of the Annual Survey of Industries, and the National Accounts Statistics. The study also examines if (a) the popularly used financial indicators really reflect the underlying investment trends, and (b) the expected association between electricity consumption and industrial output holds. Though exploratory, the findings reported seem to support the growing perception.

ACCURATE and up to date industrial statistics are essential for policy, be it public or corporate, in an era of economic 'planning' or 'reforms'. There is a growing perception that the quality of India's industrial statistics has deteriorated over the years. This exploratory note seeks to find out if such a perception has any basis, with respect to some of the widely used industrial statistics.

Section I, examines the quality of the Index of Industrial Production (IIP) - the most widely used leading output indicator. Development finance institutions' disbursements of long-term credit, and mobilisation of capital in the primary stock market are widely used to forecast corporate investment activity How useful these are to predict domestic fixed capital formation is examined in Section II. In a modern industrial economy, there is expected to be a close technical relationship between electricity consumption and manufacturing output. Does such a relationship hold in the Indian context, we find out in Section III. With the rapid growth of the unorganised manufacturing, there is a widespread belief that the value added in this sector is significantly underestimated. Section IV provides some indication of this tendency. Section V discusses some evidence of growing problems with the Annual Survey of Industries (ASI). Section VI concludes by summarising the main findings of the study.

The questions asked are, how reliable are these leading (and lagging) indicators of manufacturing output and investment? Do they accurately and consistently reflect the underlying trends, given that the production and the organisational structures are becoming increasingly complex?

I
Index of Industrial Production

Index of industrial production (IIP) - available monthly, with the least time lag - is one of the most widely used leading indicators of industrial production. National Accounts Statistics (NAS) contains annual value added and capital formation estimates, with over one-year lag, separately for the registered and unregistered manufacturing. Disaggregated value added estimates for two-digit industry groups are available with over two-year time lag. The NAS is the only source of estimates for the unregistered manufacturing value added and investment. The ASI Summary Results of the Factory Sector that provide the disaggregated data – at three-digit level and by states – are available with a lag of at least three years.[1]

Manufacturing sector constitutes over four-fifths of the IIP's weightage, the remaining being mining and electricity sectors. The index is available for 18 two-digit industry groups; and for five use-based, three input-based and two sector-based categories [RBI 1986]. Source of the primary data for estimating the index is voluntary reporting of monthly output by firms with equipment investment of over Rs 20 lakh in 1980. However, since in some industries small-scale sector dominates, they are also reportedly included in the index.

Last year, after a gap of over a decade, a revised IIP was introduced with 1993-94 as the base year. Reportedly, the number of items included in the 1993-94 series is substantially larger, and it is intended to include even more items from the small sector as and when data become available.[2] Does the revised index really represent an improvement? In other words, is it better at reflecting the underlying production trends? We contend that it probably is not, for the following reasons.

Periodic revision of any index numbers is desirable to account for the changes in the composition of the basket of goods that they represent. During the 13 years since the last revision, the industrial output has grown annually at over 8 per cent, and with considerable changes in its composition. Therefore, the IIP's revision is welcome, to the extent the new index better captures the changes in the output composition. In fact, this has been a routine matter with the official agencies as the index has been revised five times since 1950, roughly once a decade.

However, the other problem remains. The inadequate and poor quality of the primary production data used for estimating the index is perhaps far more significant. Unfortunately, the revision does little to correct it. Reportedly, 18 official agencies supply the primary data for estimating the index, though most important of them all is the Department of Industrial Policy and Promotion (earlier DGTD) that provides data on the manufacturing sector.

Development Commissioner, Small Scale Industries (DCSSI) is reportedly responsible for supplying data for 18 items of this sector. However, this agency seems to be unable to do so. To quote the press release issued to notify the new IIP, "In the absence of regular monthly production data from the unorganised sector, *the item basket has been identified on the basis of data from the registered sector only*. Further, the source agency (DCSSI) could not line up the production data for the items of the revised series" (p 5, emphasis added).[3] Evidently, the index does not capture the unregistered manufacturing at all – contrary to the official claim and its endorsement by many commentators [Pradhan and Saluja 1998b].

On the face of it, there are reasons to believe that the quality of the primary data has deteriorated over the decades. In a regime of industrial licensing, firms conceivably had an interest in voluntarily reporting their output; and the official agency perhaps had some administrative powers to ensure compliance. In other words, since the data generation process was a by-product of the regulatory regime, the index was perhaps more representative of the underlying production trends.

However, since the mid-1980s – and especially since 1991 – with a steady decline and deregulation of output and investment controls, firms have little incentive to report their output to the official agency.[4] Moreover, the officials have little leverage to enforce any rule in

this regard. So, it is likely that non-reporting has gone up, and the index could have become increasingly unrepresentative.

To test this proposition, we compute simple correlation coefficient of annual growth rates of the IIP and the NAS series. This assumes that the NAS series – that is, in turn, based on the ASI data (except for the most recent two years) – is a more accurate representation of the underlying production trends. First, the correlation coefficients are estimated between the growth rates of the IIP and (i) the registered and (ii) the total manufacturing.[5] These are done for two sets of overlapping time series data: (i) 1970-71 to 1984-85, and (ii) 1980-81 to 1995-96, corresponding to IIP with base year 1970-71, and IIP with base year 1980-81, respectively.

Table 1 shows that for Period-I, the IIP growth rate is statistically significantly correlated with both the registered and total manufacturing growth rates. However, for Period-II, the correlation coefficient between the IIP and the registered manufacturing is not statistically significant. Further, if we restrict the time series in Period-II up to 1990-91, then there is no statistically significant correlation between the IIP and either registered or total manufacturing. If we take shorter time-periods, then the association becomes perverse, as illustrated in Table 2, wherein Period-II is divided into three sub-periods. Therefore, there is some basis to believe that increasingly the IIP has become unrepresentative of the underlying output trends, as reflected in the ASI data.

How does the association between the IIP and the ASI look at the disaggregated level? To find out, we do a similar exercise, by estimating correlation coefficients of the growth rates at two-digit industry groups. The answer is no, as most of the correlation coefficients are not statistically significant and, there is no systematic pattern to those that are statistically significant (Tables 3 (a) and (b)). Therefore, it is reasonable to infer that neither in the period of licensing (1971-85), nor in the regime of deregulation (1981-95) was the IIP an accurate predictor of value added at two-digit industry level.

To summarise the findings of this section:

(1) For the period 1971-72 to 1985-86 (Period-I), growth rates of IIP for manufacturing is highly correlated with those of (the registered and total) manufacturing value added. However, this association turned statistically insignificant during 1980-81 to 1995-96 (Period-II). The associations weaken further and turn perverse for sub-periods since 1980-81.

(2) At two-digit industry groups, during both the sub-periods, there is no statistically valid association between the growth rates of the IIP and (the registered and total) manufacturing value added.

From these, one can reasonably infer that the IIP never accurately predicted manufacturing growth rates at a disaggregated level. Though for the manufacturing sector as a whole the IIP could have been well used as a lead indicator for the 1970s, it cannot be used to predict manufacturing value added in a period of deregulation (in the 1980s and beyond).

Clearly, the IIP has deteriorated over the last two decades. This is mainly because the primary data that is used for computing the index has become poorer in quality and probably scarcer in quantity. The recent official press note in fact admits it: "For the registered sector... the quality of production data supplied by the major source agencies suffer from substantial non-response on the part of manufacturing units and consequential estimation resorted to by the source agencies.... *The industrial growth based on the revised IIP do not therefore, seem to reflect the perceived ground realities*" (p 5, emphasis added).

Therefore, no amount of updating and refining the IIP's weighting diagram can compensate for lack of reliable primary data that are used for computing it. Evidently, the official agency is well aware of the problem. To quote the press release once again, "In order to improve the quality of production data, the Department of Statistics is having regular interaction with the source agencies to improve their system of data collection and estimation procedures. It is expected that the quality of data will improve in the near future". How will 'regular interactions' ensure better data collection? They probably will not, unless the firms face a credible incentive (and a threat) to supply the data.[6]

II
Financial Data and Trends in Fixed Investment

Development finance institutions' (DFIs) sanctions and disbursements of long-term credit have been widely used as lead indicators of private corporate investment. This is based on Samuel Paul and Rangarajan's (1973) short-term forecasting model that has been regularly updated for over two decades now.[7] Does the flow of long-term credit really predict fixed capital formation in the private corporate sector?

To test the proposition, we computed simple correlation coefficient between the annual growth rates of fixed capital formation in private corporate sector (NAS data) and disbursement of long-term credit (both in nominal terms) for the period 1965-66 to 1995-96. Since fixed capital formation is likely to spill over into more than one year, we have also estimated the correlation coefficient with one year lag. Table 4 shows that for none of the time-periods is there a statistically significant correlation

TABLE 2: COMPARISON OF THE ASI AND IIP GROWTH RATES OVER THREE SUB-PERIODS

Average of Years	Total Manufacturing	Registered Manufacturing	IIP
1981-85	6 2	7 7	5.7
1986-91	7 5	7.5	8.9
1992-96	6 6	7 1	6.4

between the DFIs disbursement and corporate fixed investment. However, during the period of industrial licensing (1995-80) the correlation is valid with one-year lag. But this ceases to be so in the period of deregulation (1981-96), suggesting that while long-term lending could have been used as a lead indicator in a period of investment licensing, it cannot be used in the liberalised regime. The absence of the association in recent years is widely believed to be due to DFIs' growing practice of 'ever greening': loans disbursed to defaulters that are often used to repay old debts. As the data on disbursements net of ever greening are not publicly available, the widely held belief cannot be tested.

Similarly, in recent years, capital raised by initial public offering in the primary stock market is also widely used to predict corporate investment trends in the short to medium term. This measure too has an intuitive appeal. But is it empirically valid? Table 5 shows that these results are similar to the above findings: In the regime of industrial licensing (1962-80), total capital raised in the primary stock market is positive and statistically significantly correlated with corporate fixed investment. This is true even with one-year lag. But the relationship ceases to exist since the 1980-81. Therefore, in the present context, the primary stock market mobilisation has little relation to corporate fixed investment.

III
Electricity Consumption and Industrial Output

Since almost all modern manufacturing industries use electricity as motive power, and since there is a broad technical relationship between electricity use and value added, growth in electricity consumption, in principle, can be used as a proxy for industrial output growth. To test this proposition, we estimated simple correlation coefficients between annual growth rates of industrial output and electricity consumption (Table 6). None of these correlation coefficients are statistically significant, though all of them have the expected positive sign. Since, in principle, there is a technical relationship between the two variables, lack of correlation suggests incorrect recording of inputs and output.

IV
Underestimation of Unregistered Manufacturing Output

Over a long period, there is a positive and statistically significant correlation between the growth rates of the registered and the unregistered manufacturing value added that are reported in the NAS. Therefore, one may believe that the growth rates of unregistered sector are reasonably satisfactory, despite some widely known output underestimation (of level of value added) in this sector.[8] However, careful micro studies have repeatedly hinted at the growing manufacturing activity in unregistered sector that escapes the official estimation. While such a criticism has an intuitive appeal, it has been difficult to substantiate it in the aggregate. We now provide some evidence that seems to lend credence to the widely held suspicion.

Between 1977-78 and 1993-94, while the unregistered manufacturing sector's share in total manufacturing value added declined by 4 per cent, its share in total manufacturing employment has increased by 5.1 per cent (Figure 1).[9] These changes can be reconciled only under the assumption that the growth rate of value added per worker (labour productivity) in unregistered manufacturing has been growing slower than that in registered manufacturing.[10]

Since value added in unregistered sector is a product of (i) number of workers and (ii) benchmark estimates of value added per worker, the underestimation could be because of either variable. A preliminary scrutiny ruled out underestimation of number of workers, as they seem to be based on decennial census and the NSS estimates. Since the estimates of value added per worker are allegedly outdated, this possibly accounts for the underestimation of value added.

This seems to be borne out by the exercise reported here, examining the relative movements in the growth in value added per worker, and fixed capital stock per worker during 1981-91 in the registered and unregistered manufacturing sectors. It was found that for 100 units increase in fixed capital per worker in registered manufacturing, value added per worker increased by 156 units. However, in unregistered manufacturing, the corresponding increase in value added per worker was only 88 units. Relatively slower growth of value added per worker in unregistered manufacturing seems to suggest underestimation of value added in this sector due to usage of outdated parameters.

The parameters could be outdated (or under-reported) for the following reasons.

Table 4: Simple Correlation Coefficient between Nominal Annual Growth Rates of DFIs' Disbursement and Corporate GFCF

Years	No of Observations	Correlation Coefficient	With One-Year Lag: No of Observations	With One-Year Lag: Correlation Coefficient
1965-66/1979-80	15	0.0	14	0.662*
1980-81/1995-96	16	0.0	15	0.158
1965-66/1995-96	31	0.0	30	0.540*

FIGURE 1: UNREGISTERED MANUFACTURING SECTOR'S SHARE IN TOTAL MANUFACTURING EMPLOYMENT AND VALUE ADDED

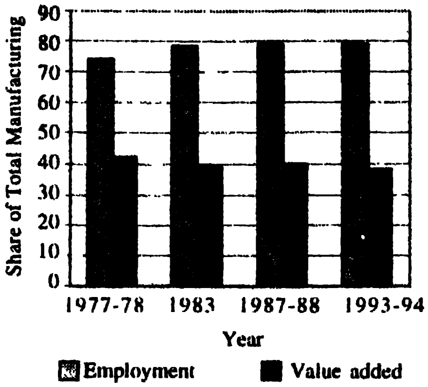

FIGURE 2: SHARE OF FACTORY SECTOR IN CENSUS MANUFACTURING EMPLOYMENT

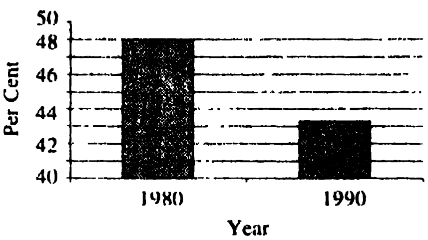

FIGURE 3: NO OF FACTORIES IN STEEL INDUSTRY (NIC 331)

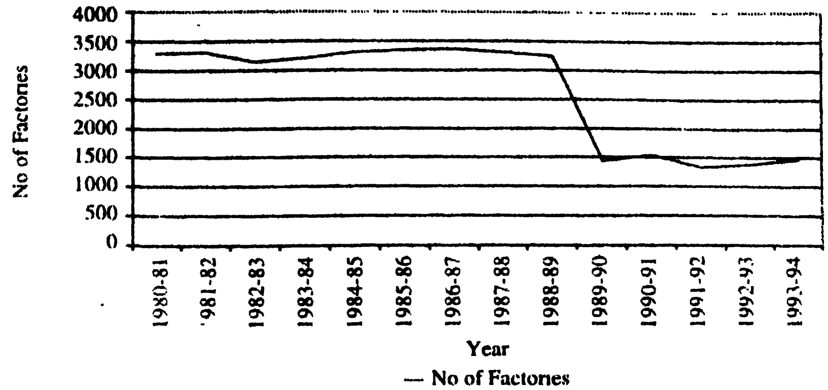

First, labour productivity could have significantly gone up with diffusion of electricity as motive power that has occurred during the last two decades. Second, unregistered manufacturing has witnessed a steady growth in fixed capital formation, thus indicating a steady growth in potential output. Finally, since unregistered manufacturing, unlike the registered sector, operates under competitive conditions (due to low entry barriers), it is reasonable to argue that investment and employment growth in this sector would have occurred mainly under private profitability considerations. In other words, on the face of it, growth in wage employment and fixed capital formation in this sector is unlikely to have occurred unless the increase in labour productivity more than compensated the cost of capital and labour. Therefore, we have a reasonable basis to argue that parameters of value added per worker used for unregistered manufacturing are likely to be underestimated, which accounts for the growing underestimation of value added in this sector.

V
Annual Survey of Industries

In principle, all factories registered under the Factories Act (under section 2m(i) and (ii)) are included in the Annual Survey of Industries (ASI). The universe of the ASI is the live register of factories maintained by the Chief Inspectorate of Factories in each state. Therefore, the ASI's coverage can only be as good as the factories' list. Under the Collection of Statistics Act (and related laws), all registered factories are expected to file an annual return. Every year, the CSO conducts a census of all factories employing 50 workers and above (100 workers and above without using power). Sample surveys – covering one-half of all registered factories employing between 10 and 50 workers (20 and 100 workers without using power) – are conducted every year.[11]

How good are these estimates? Reviewing the methodology, Pradhan and Saluja (1998a) said, "For the organised manufacturing industries fairly reliable data are available annually, but with a considerable time-lag" (p 1270). This view needs to be re-examined for three reasons: (i) incomplete coverage of factories, (ii) under-reporting of workers in factories covered, especially in small factories, and (iii) under-reporting of value added.[12] With the size structure moving towards the smaller sized factories within the factory sector and into the unorganised sector, (i) and (ii) are believed to have increased significantly [Nagaraj 1994].

To illustrate the extent of non-recording of factories and changes in them, we compared the number of factories in ASI in manufacturing with number of establishments in manufacturing employing 10 or more workers in economic censuses of 1980 and 1990.[13] In 1980, number of factories in ASI formed less than one-half (48 per cent) of manufacturing establishments in the census. Even if a variety of manufacturing establishments are exempt from the Factories Act, the fact that over 50 per cent of them have not registered under the act suggests a gross extent of under-reporting of factories (Figure 2). This is consistent with evidence from many micro level studies. More significantly, the proportion of factories registered under the Factories Act fell by 5 per cent, to 43 per cent in 1990 suggesting a rapid growth of under-reporting of factories.[14]

This finding can be corroborated with other evidence as well. During 1980-90, when registered manufacturing value added grew annually at over 8 per cent, with a steady delicensing of investment and output controls resulting in considerable new entry into manufacturing industries, yearly trend growth in number of factories was as low as 0.9 per cent.

Under-reporting of value added is another important problem that has been repeatedly pointed out by careful studies. Raj (1986) suggested serious underestimation of value added in registered manufacturing due to growing tax evasion.[15] More recently, T N Srinivasan (1994) reiterated the same point: "... given the incentive for evasion of excise and other taxes, there are reasons to believe that value added data may be biased and the extent of the bias could be varying over time" (p 9).

The above mentioned problems of increasingly poor coverage and probable under-reporting of value added can be

TABLE 7: GROWTH IN STEEL INDUSTRY

(Average annual growth rate)

Years	Finished Steel (in Physical Units)	Hot Metal (in Physical Units)	Real Gross Value of Production (*ASI* Series)	Real Gross Value Added
(i) 1980-81/1994-95	5 7	5.1		
(ii) 1985-86/1994-95	5 7	5.6		
(iii) 1981-82/1994-95		5 4	4.1	5 4
(iv) 1985-86/1994-95			6.7	5.9

Note: Gross value of output and gross value added include NIC 330, 331, 332.
Source: *ASI Summary Results and SAIL YearBook*, various issues

illustrated by the following example of steel industry. As shown in Figure 3, number of factories in 3-digit industry 331 ('manufacture of semi-finished iron and steel products in re-rolling mills, cold-rolling mills and wire drawing mills) has sharply fallen from about 3,200 till 1988-89 to about 1,400 thereafter. On the face of it, it could be due to a reclassification, to accommodate a change over from NIC 1971 to NIC 1987 But a close perusal of data did not suggest any corresponding increase in other steel related 3-digit industry groups. Therefore, we suspect that enumeration has become incomplete, unless there is evidence of a large-scale plant closures.

The sharp fall in number of factories in this industry is in contrast to other evidence, mainly from the corporate sector.[16] Since mid-1980s, in response to delicensing, there has been considerable expansion of existing firms, and new entry into the industry. Moreover, there seems to have been a change in the product mix in favour of 'flat' products and technological upgradation leading, in principle, to greater value addition per unit of output – for example, automobile grade flat products of thinner gauge and greater width.

Table 6 shows estimated growth rates of output from *SAIL Year Book*, and real gross value of production and gross value added using *ASI* data. Evidently, growth rates reported by different measures are roughly of same orders of magnitude. However, given the changes in the industry since delicensing in mid-1980s, many indications suggest an increase in value added to value of production ratio. Since this is not revealed in the growth rates reported above, one suspects that value added estimates may be underestimated.

VI
Summary and Conclusion

Reliable and up to date statistical information is vital for economic decision-making, both at the micro and at the macro level. This exploratory note tried to assess the quality of some of the widely used industrial statistics. IIP is the most widely used leading indicator of output trends, as it is available monthly, with least time lag, and with analytically meaningful disaggregation. NAS is the only source of data for the unregistered manufacturing value added and capital formation. ASI provides detailed information on registered manufacturing, though with considerable time lag. Long-term credit by development finance institutions (DFIs) and the initial public offerings in the primary capital market are also widely used to predict fixed investment trends in the private corporate sector.

How reliable are these data sources? Have their quality deteriorated over time? This note sought to answer these questions, using simple correlation coefficient method to time series of annual growth rates. The following are the main results. (1) Annual growth rates of the IIP for manufacturing and value added in manufacturing (registered and total) sector are highly correlated, for the periods 1971-85 (Period I). But the association turns statistically insignificant for 1981-96 (period II), and parts thereof. Correlation between the IIP and the ASI for cross-section of 2-digit industry groups is not statistically significant for both the time periods. Since the IIP is a lead indicator, it could have been used to predict value-added trends in Period I, that is, during the regime of investment and output licensing. However, it cannot be used in the same way in the liberalised regime (Period II). The study supports the view that the quality of IIP as deteriorated since the 1980s with gradual industrial

deregulation, as much of the primary data for estimating the index was a by-product of the regulatory regime,

(2) Widely used information on (i) development finance institutions' sanctions and disbursements of term loans and (ii) capital raised in the primary capital market is not correlated with fixed capital formation in the private corporate sector since 1980-81. Therefore, this financial information is a poor predictor of the real trends in the deregulated regime.

(3) In principle, though there is a strict technical relationship between electricity use and manufacturing value added, in reality this association was not found to exist in India. This finding questions the quality of the recorded information on electricity input and value added estimates.

(4) During 1977-78 and 1993-94, while the employment share of unregistered sector in total manufacturing has gone up, the corresponding value added share went down. These inverse movements can be reconciled only under the assumption that the labour productivity growth in unregistered manufacturing is lower than that in the registered sector. A closer examination seems to strengthen the suspicion that the parameters of value added per worker used in computing output could have been seriously underestimated.

(5) In recent times, the ASI seems to underreport number of factories and hence value added even in a well-organised industry like steel. It, therefore, raises suspicion that the quality of the ASI data is declining in recent years.

Admittedly, results of this exploratory effort have yielded only bits and pieces of evidence on the quality of the data. They nevertheless seem to tell a reasonably consistent story: India's industrial data system has weakened over the years, and therefore the information may not reliably capture the underlying real tendencies. Many of the widely used indicators and presumed technical relationships have little empirical validity. This finding supports the popular perception of the deteriorating data quality. If this inference is correct, then there is an urgent need for a thorough re-examination, and revamping of the statistical system.

Notes

[Following the usual disclaimer, the author thanks K V Ramaswamy, M H Suryanarayana and A Vaidyanathan for their detailed comments and suggestions on earlier versions of this study.]

1 For a detailed account of the strengths and limitations of all these sources of data, see Pradhan and Saluja (1998a).

2 Pradhan and Saluja (1998b) gives details of the revision that the IIP has recently undergone.

3 Brief Note on the Revision of Base Year of Index of Industrial Production from 1980-81 to 1993-94 (undated).

4 In fact, the CSO officials have admitted this. To quote Kulashrestha and Kolli (1995): "After liberalisation, some of the major units including some of the PSUs have not been furnishing returns. This makes the estimation procedure for non-responding units very difficult in the absence of information on whether the unit is in existence or closed, or on strike or on partial operation. Government's efforts to persuade the units to furnish returns now met with little success. The GOI have subsequently issued a Press Note ... reiterating the requirement of submission of returns by the industrial undertakings to concerned technical agencies. Despite this, the coverage of units has been steadily declining". (p 125)

5 Unless otherwise mentioned, all variables in this paper are in real terms.

6 A report in *The Times of India* (January 16, 1999) said, 'The Department of Statistics has not released the industrial production figures for November 1998 on the ground that the data provided by the department of industrial policy and promotion (DIPP) on manufacturing sector 'suffers from lack of quality' ... 'Despite repeated efforts, the DIPP .. has not furnished the information regarding itemwise response rate as well as the method of estimation or non-response' Mr Asthana [Secretary -in the department of Statistics] said (p 17)

7 Till 1982, Rangarajan's forecast of corporate investment was reported in the *Economic and Political Weekly* In the recent years, these were officially estimated, and reported in the *Reserve Bank of India Bulletin*.

8 There have been many studies on the 'black economy' that in fact looked carefully at specific unorganised manufacturing industries like power loom weaving, dyestuffs, etc. Most of them estimate the extent (level) of underestimation without saying if the black economy is growing faster than the measured economic output.

9 This method of looking at the relative employment and value added shares to detect output underestimation is an old one, widely used in studying the long term trend by Arthur Burns and Simon Kuznets.

10 Sources of data for Figure 1 are, NSS employment and unemployment surveys, and *NAS*, various issues.

11 For a careful and fuller description of the ASI's methodology, see Pradhan and Saluja (1998a)

12 Growing non-response to ASI is widely believed to be yet another reason for deteriorating data quality On a closer examination, we did not find any statistically significant deterioration in the extent of non-response over the period 1980-81 to1994-95.

13 These figures refer to all-India, excluding Assam, as the censuses were not conducted in that state.

14 This evidence on the growing extent of nonregistration of factories under the factories act seems to reinforce findings of many fieldwork based micro studies [Nagaraj 1989; Singh 1990]. But what is more surprising as we discovered during our field-work in Bangalore city in mid-1980s, was that many medium sized factories that we had personally visited were missing from the factories' list. Though we do not have documentary evidence to support our case, we do believe there is a case for examining the quality of the factories list maintained by the Inspectorate of Factories

15 To quote Raj (1986:11) "The number of 'registered firms', i e, those registered with income tax authorities, has been increasing at a phenomenal rate from about the middle of the 1960s. Many of them are known to be used by manufacturing enterprises as commission agents for purchase of inputs and sale of products, thereby siphoning away profits through various forms of transfer pricing. Underestimation of value added in this manner has been therefore probably increasing in scale through this period".

16 After delicensing of steel industry in 1985 there was considerable new entry into the industry as evident from capital mobilised in the primary stock market and term loan granted by development finance institutions. Of the 48 listed 'mini steel' companies listed in Bombay Stock Exchange in 1997, half entered the industry after 1985. For detailed statistical information, see the annual report of the Department of Steel, 1997 98.

Decentralisation: Some Initiatives in Health Sector

Devendra B Gupta
Anil Gumber

There have been two major kinds of reforms affecting the rural health services. One is the introduction or expansion of user fees and the other is the devolution of central responsibilities to lower levels of government. This paper reviews the various initiatives towards decentralisation in the formulation of the several World Bank assisted projects in population, health and nutrition with a focus on the problems which may arise in the effective implementation of the policy.

I
Introduction

GOVERNMENT-RUN rural health services in developing countries, including India, are highly centralised with very little local autonomy either over programmes or resources. This centralisation is commonly cited as the source of several typical problems: (a) Services are unresponsive to local demands and needs, partly because the population has few alternatives, (b) In spite of low overall coverage of services, there is excess capacity in infrastructure, with corresponding shortages of supplies and sometimes of staff; (c) Staff are assigned, rotated and paid with no relation to output of services or client satisfaction, are often inadequately or under-trained, ill-equipped, and commonly indulge in private practice; and (d) Referral systems do not work, so many patients bypass the rural health infrastructure, and when they can, go directly to hospitals, raising costs and leading to more hospital and less lower-level investment in facilities.

In contrast, the privately-run and NGO-run services are almost totally decentralised. This is often mentioned as the reason why they are preferred most and more satisfactory to clients who are willing to use them despite higher fees and/or average quality than they receive in the public sector. However, it is difficult to disentangle the effect of decentralisation from that of greater resource availability in explaining which services work better.

In recent years, there have been two major kinds of reforms affecting public sector rural health services. One is the introduction or expansion of user fees with varying degrees of local control over their use; typically some fraction of revenue is left to local discretion or is allowed for non-salary expenditures such as on drugs. Salaries continue to be paid centrally. This kind of reform for instance has recently been introduced in Andhra Pradesh, Karnataka, Punjab and West Bengal, under the World Bank assisted State Health System Project. The other reform is the devolution of central responsibilities to lower levels of government (district and sub-district levels). This change may or may not always be accompanied by a comparable financial and administrative transfer. The panchayats in India are examples in question. It is also evident that it matters not only who pays and controls various rural health and family welfare services, but also exactly how funds are transferred to service providers. In this context what is more important is the mechanisms rather than the sources.

The World Bank Development Report (1993), *Investing in Health*, points out that "a policy that can improve both efficiency and responsiveness to local needs is decentralisation of the planning and management of government health service". After making this assertion, the report shows its awareness of many problems that have arisen in countries where decentralisation has been attempted. The report, further points out that "there have been some successes, however, that offer lessons for other countries". Ugalde and Jackson (1995) in their critique of *Investing in Health* find the report's recommendation for decentralisation problematic and concur with Collins (1989) that "... decentralisation is a complex process and cannot be recommended across the board (as the World Bank has done) without taking into account historical, political, social and geographical realities".

In this paper an attempt is made to briefly trace various initiatives towards decentralisation in the formulation of several World Bank assisted projects in the population, health and nutrition (PHN) sector in India over the course of last 20 years or so. We also focus on problems which are likely to arise in the effective implementation of a policy of decentralisation in India. To begin with we provide a brief background about the process of decentralisation which has been taking place for a long time, and which has now culminated in the amendment of constitution to provide for panchayati raj institutions (PRIs) in the country [For a detailed review of panchayati raj see World Bank 1997]. This is followed by a description of the organisational structure of health system in India.[1] *Inter alia* the paper also attempts to indicate the extent to which PRIs could be linked to the health sector. This is followed by a brief description of the elements of decentralisation that are incorporated in the World Bank assisted project in the PHN sector.

First, a word about the meaning of decentralisation. In our analysis it would imply the devolution of power and resources to the district and lower levels of health administration. In its most developed form the centre and states would provide only a broad guiding framework and the financial resources to the lower administration levels, leaving planning, implementation, and monitoring to these levels. The centre still needs to formulate national policies, including ethical standards and principles of social justice – for example, issues of equity in the introduction of medical technical innovations – and evaluate the overall achievement of public health objectives. Decentralisation strategies should therefore endeavour to find a balance between these central tasks and decentralised tasks.

II
Decentralisation in India

The village institutions in India have now been in existence for a long time. They were called panchayats – a council of five persons in a village. While over time the autonomy of these panchayats gradually disappeared owing to the establishment of local civil and criminal courts, revenue and police organisation,

increase in communications and the growth of individualism, the Constitution of India however rightly recognised the need to revive these institutions.

With the inauguration of the Community Development Programme in October 1952, the blocks (consisting of about 150-200 villages) became the units of development administration within the existing districts. In 1957, the Balwantrai G Mehta Committee recommended the establishment of a three-tier panchayat raj system – the middle tier namely, panchayat samiti at the block level, playing a pivotal role in the scheme of decentralisation. While the village (or gram) panchayat constituted the lowest tier, the zilla parishad with the district collector as the chairman, constituted the top tier.

While the functions entrusted to the village panchayats included village roads, community wells, maintenance of public parks, tanks, irrigation works, public hygiene, drainage, and other civic services, the zilla parishads were made responsible for primary education, as also with functions relating to rural industries, primary health care, medical relief, women and child welfare, maintenance of common grazing grounds and other community lands and properties and provision of inputs for agricultural production. The extent and tempo of the involvement of the panchayati raj institutions in basic planning and implementation of development projects however differed considerably both between states and within states.

This phase of ascendancy in the history of the panchayati raj in India continued till 1964. This was followed by a phase of stagnation (1965-69) and then of decline (1969-77). This was largely due to erosion in commitment over time to democratic values. Also the flow of funds for block development slowed down. Where the party in power apprehended poor performance in the polls to PRIs, the tendency was to postpone the elections indefinitely. The decline was conspicuous in almost every state except Maharashtra and Gujarat, where the primacy was with the top tier, namely the ZPs which had considerable administrative powers.

The revival of interest in panchayati raj came about with a change of government at the national level during 1977. The committee set up under the chairmanship of Ashok Mehta re-emphasised the importance of panchayati raj, and recommended a two-tier structure – zilla parishad at the district level and mandal panchayat (MP) for a group of villages, with a population of 20,000-30,000 (i e, below the block level), the key level being the ZP. It also recommended that the district should be the first point for decentralisation and favoured the official recognition of the participation of political parties at all levels of panchayat elections.

An all round awareness for reforms in panchayati raj system was thus created at that time. Also the attempts in Karnataka and Andhra Pradesh to create new PRIs highlighted the need to transfer power of the state to democratic bodies at the local level. A committee was then set up to prepare a concept paper on the revitalisation of PRIs. Among other things, the committee recommended that local self-government should be constitutionally recognised, protected and preserved by the inclusion of a new chapter in the Constitution. It also recommended a constitutional provision to ensure regular, free and fair election for the PRIs and suggested that the election committee be made responsible for this task. The government therefore, introduced a comprehensive amendment bill on September 16, 1991 and eventually the Constitution (73rd Amendment) Act, 1992 was brought into effect from April 24, 1993.

Salient Features of 73rd Amendment

This act envisages the establishment of panchayats as units of local self-government. Adequate powers and responsibilities would be devolved upon these panchayats at the appropriate level to enable them to prepare and implement schemes for economic development and social justice.

The gram sabha or village council has been envisaged as the foundation of the panchayati raj system. It shall perform such functions and exercise such powers as may be entrusted to it by the state legislatures. There shall be three-tiers of panchayats at the village, intermediate and district levels. Only states having a population, not exceeding 20 lakh, have the discretion not to constitute the panchayats at the intermediate level. All seats in a panchayat at every level are to be filled by direct elections from territorial constituencies demarcated for this purpose, with the ratio between the population of such constituency and the number of seats allotted to it being the same throughout the panchayat area.

Further, a distinguishing feature of the panchayati raj legislation is to involve the backward and deprived sections of the society by providing reservation of seats at every level to the SCs/STs in proportion to their population in a given panchayat area and for women to the extent of not less than one-third of the total number of seats. The term of office of panchayat at every level is five years and elections are to be completed within six months from the date of dissolution or expiry. There is also a provision of constituting a Finance Commission every fifth year in every state to go into the principles governing the distribution and devolution of financial resources between the state and the panchayats at every level and the measures to improve the financial position of the panchayats.

A new schedule called the Eleventh Schedule comprising of 29 items has been added to provide an effective role to the PRIs in the planning and implementation of works of local significance ranging from drinking water, agriculture, land and water conservation to communications, poverty alleviation programmes, family welfare, education, libraries and cultural activities, maintenance of community assets, etc.

The preceding discussion would show that the Constitution (73rd Amendment) Act, 1992 would be able to break a new ground. The PRIs set up under this act would serve as principal vehicles of development of rural areas in spheres assigned to panchayati raj institutions at various levels. For effective functioning of these institutions both political will and administrative back up would be needed. This would to a great extent depend upon the initiative of various states. Devolution of powers and assignment of functions are also under way. A new challenge is posed and it is expected to improve the quality of implementation, as PRIs are indeed ideally suited for effective implementation of the programmes entrusted to them.

III
Organisational Structure of Health Care Administration

The organisational set up of health administration in India is guided by the Constitution according to the items such as public health and sanitation, hospitals and dispensaries, etc, are included in the state list, while items like population control, medical education, adulteration of food stuffs, medical profession, registration of births and deaths and lunacy and mental health, etc, fall under the concurrent list.

The union ministry of health and family welfare (MOHFW) is in practice entrusted with the responsibility of implementing many programmes of national importance such as family welfare, primary health care services, prevention, control and

eradication of major communicable diseases. The MOHFW has several centrally-sponsored schemes which are implemented by the states. The MOHFW has three departments, department of health, department of family welfare and the department of Indian System of Medicine each headed by secretary to the government of India. There is also the Directorate General of Health Services which is an attached office of the MOHFW While in theory, each state can formulate its own health policy, financial constraints and other factors inhibit such a course of action. In practice state governments have to function within the parameters of the national health policy laid down by the union government in 1983. Also the government of India provides the link and regulates the relation between the state governments and international agencies such as the WHO, UNICEF, UNFPA and the World Bank Besides, having the responsibility of providing co-ordination between the state governments and itself, the union government sponsors numerous schemes through provision of finance and other inputs for their implementation through the state governments. It may be noted that despite restrictions on the freedom of the state agencies due to these factors, there is ample scope for the states to administer the schemes suiting local conditions within the overall ambit of national policies.

The broad administrative structure for health in various states is more or less similar except with some minor variations. At the headquarters in a state capital, there are two levels, the secretariat and the directorate of health services.

Generally at the highest level, there is a department of health and family welfare located in the secretariat which is headed by a minister, generally of cabinet rank, as health is considered to be an important state subject. At the official level, the department is headed by a secretary who usually belongs to the Indian administrative service. Assisting him are additional secretary/joint secretary (IAS), deputy secretaries, under-secretaries and other office functionaries. The department of health at the secretariat level is concerned with the formulation of policies, besides dealing with all legislative matters including the making of rules and regulations on matters of health and administration. The secretariat also helps the health minister in the discharge of his responsibilities to the state legislature by providing necessary information and assisting in answering questions raised by the legislators

All important proposals or schemes relating to health are submitted by subordinate agencies for approval and sanction of the secretariat. It also broadly supervises, regulates and controls the activities of the notifications and the issue of circular memoranda and government orders. The department, besides receiving periodic reports and returns, reviews the progress of work through inspection and other ways. The secretariat exercises considerable authority both in personnel and financial matters. In some states there are separate secretariat departments for health and family welfare (e g, Tamil Nadu and Karnataka) while in others (as in Andhra Pradesh) they have a health, medical and family welfare department as these subjects are related.

The state directorates function as technical wings of the state departments of health services. These directorates are responsible for implementing the health policies of the state governments by maintaining proper technical standards. The precise administrative arrangement at the level of the directorate however varies slightly from state to state. For instance in some states (such as in Tamil Nadu) there is more than one directorate separating medical care and medical education from the public health. The underlying rationale for moving away from one single directorate to more than one directorate is the expansion of health services in the country in the last couple of decades. It may be pointed out that there is hardly an underlying rational for bifurcation or unification of the directorates in different states. This is in an arbitrary manner, sometimes to accommodate or to prevent some one from holding the position of the director.

For administrative reasons the states are divided into a number of zones or regions through which the directorates supervise and control the field operations. For instance in Andhra Pradesh, there are six regional directors for six zones. This came into effect in 1978. Each regional director has the responsibility for the management of health and medical programmes in his jurisdiction. He also looks after the personnel and establishment matters in his assigned area. In Karnataka also there is decentralisation of supervisory authority at the divisional level. Thus there are four divisional directors with Bangalore, Mysore, Belgaum and Gulbarga to look after all health and family welfare activities in the respective divisions. The large hospitals are excluded from their purview.

The district level is most crucial in the chain of command of the public health department. Many of the decisions having bearing on day-to-day operation of health centres are made at this level only. Hence the effective implementation of various health policies and programmes largely depends upon the supervision and control exercised by the district officers over the management of health centres in the district. It is also at this level that co-ordination and liaison with other departments and agencies of the government takes place under the overall supervision of either the district collector or the zilla parishad president. Such an arrangement is helpful in ensuring effective implementation of various national health programmes where several agencies as environment, forestry, etc, may be involved with the health department. In districts, the district health officer/chief medical officer is the in-charge of managing medical and health services and family welfare. The district hospitals are usually under the charge of civil surgeons However, for family planning programme, there are separate district family welfare officers.

Most district health officers are assigned considerable administrative work leaving them with very little time for technical supervision of the field services including for undertaking visits to primary health centres and other clinics under their jurisdiction. Also most inspectors are found to be casual and ritualistic in nature, thus serving very little purpose. Also very seldom any note is taken of erring medical officers of the primary health centres and reports concerning even their unauthorised absence for long periods are seldom tackled at the state headquarters. In view of this callous attitude of officials at the state headquarters level towards complaints, hardly anyone worries about reporting lack of equipment and non-availability of drugs to the health centres. On the other hand we find that decentralisation of supervisory functions to the sub-district level in Karnataka, for example, has generally proved beneficial. Of course, the success of such a step will be largely linked to the kind of officers posted there. It is here that the role of peoples' representatives in health administration, especially in monitoring the functioning of health centres including ensuring the regular attendance of medical/para-medical staff can be crucial and needs serious consideration.

At the district level and below, the revenue department and the zilla parishads play crucial roles in the provision of medical and health services to the citizens in several ways. As the chief co-ordinator at the district level, the collector or the chief executive officer of the zilla parishad

icts as a link between the health department and all other public agencies. The development commissioner who is also the collector also becomes responsible to look after the welfare of people in rural areas. In the early phase, the district collector used to exercise considerable influence in the location of the primary health centres in the district. The revenue department also plays an important role in helping the acquisition of land for housing of the primary health centres. The revenue department is also concerned with the collection and transmission of vital statistics to the health department. They also report the outbreak of the epidemics. Similarly, in the case of famine relief works and at the time of fairs and festivals, the revenue department or the zilla parishad extend their co-operation to the health department. The district collector/CEO can also exercise authority in respect of public health as for example ordering mass inoculations, destruction of infected food or drugs, etc.

The primary health centres operate from the headquarters as well as from the sub-centres. The staffing pattern in the centres have undergone a change over a period of time. There are of course minor variations in the staffing pattern from one state to another.

IV
Role of Decentralised Institutions in Health Delivery

In the preceding section we had outlined the structure of health administration in India with special reference to rural areas. It was seen that these essentially comprised of district hospitals at the top with community health centres, primary health centres and sub-centres at the lower levels. There is also standard staffing pattern for each of these health delivery system. While a PHC has one medical officer in-charge of the centre, the CHC has four medical officers who are qualified/trained to work as obstetrician, surgeon, paediatrician and physician, one of whom should have public health qualification. We saw that under the new pattern of decentralised governance, the chief executive officer of zilla parishad and the executive officer of panchayat samiti in most states have powers to exercise control over the medical officers; their recruitment and punishment is generally outside the purview of the PRI officials. However, the PRI officials are able to exercise effective control over the health functionaries through annual confidential reports.

In evidence collected on the working of PRIs in four states it is found that panchayati raj institutions have a definite role in improving the quality of health care services, especially through ensuring better attendance of health care functionaries at the local level, as well as in putting moral pressure on the staff not to shirk from work. Also the watchful participation of local communities has helped to an extent in improving the supplies of drugs and equipment through assisting the local staff of health care centres in bringing the deficiencies in the supplies to the notice of higher authorities. Another crucial role which can be assigned to the PRIs concerns the supervisory and monitoring role in preventive health care. The PRIs can also contribute significantly to programmes of health education.

We do not expect much to be achieved by succumbing to giving too many powers to PRIs. We expect a real possibility of clash between the state and PRIs when different parties control the state administration and administration of the PRIs.

The feeling one gets from the experience of the study states is that decentralised governance and local level participation can contribute importantly to improving the health care system, not only through better monitoring and supervision of the functioning of the health system at the local level but also assisting a developing plans which take care of local perceptions and hence else to demand situation for specified type of health care services appropriate to local needs.

As indicated, prior to the Constitution (73rd Amendment) Act, panchayats in different states had their own respective set up. There is however now a common pattern of organisational set up of panchayats with, of course, some minor variations. In major states, it is a three-tier system, with a senior civil servant serving as the chief executive officer of the zilla parishad. While various states have enacted their respective acts as required by the 73rd Constitution Amendment, follow up action is being taken by the different states at their own pace. Clearly, the actual functioning of the panchayat system will, to a great extent, depend on the degree of commitment on the part of various state governments.

We however envisage some problems that may arise in the effective functioning of the panchayat system. First, as the panchayats have been entrusted with a number of development and other functions, better co-ordination of PRIs with different state agencies particularly the line departments operating in the district would be needed. This would necessitate developing a proper and viable co-ordination mechanism. In this context, the Karnataka seems to have an edge where

Statement: Extent of Decentralisation in the World Bank Assisted Health Projects

Project	Level of Decentralisation: Administrative Implementation	Managerial Monitoring	Financial	Partners at Grass Roots
1 National Tuberculosis Control Project	District society	Poor, through District TBC	Directly from MOHFW	Active involvement of NGOs in some areas
2 National Cataract Blindness Control Project	District society	District Programme Co-ordinator	Directly from MOHFW	Stress on NGOs and Private Ophthalmologist; Lack of Co-ordination
3 National Leprosy Elimination Project	District society	Poor, through Supervisor and Paramedical Worker	From GOI to States to Societies	Poor Participation of NGOs
4 National Malaria Eradication Project	PRIs and local Malaria societies	Poor, only at the State Level	Funds Disbursed to PRIs	Community-based Approach and Malaria Link Volunteers
5 Family Welfare Project	Three-tier system and setting up of FPAI and SCOVA at the District Level	State Level Management Units	From GOI to State	Limited Community Participation
6 Reproductive and Child Health Project	District Family Welfare Bureau and PRIs	Target Free Approach, However Direct Monitoring of GOI on Poor Performing Districts	From GOI to State and Directly from GOI to SCOVA and First Referral Unit	Emphasised on active Involvement of NGOs, PVOs, CHWs and AWWs

all heads of technical line departments in the district are under the charge of chief executive officer of the zilla parishad. Similarly, while some states have brought the District Rural Development Agency (DRDA) under the control of zilla parishad, there are many states which are reluctant to do so. Since 29 items have been listed to be dealt by the PRIs under the XI schedule of the Constitution, keeping DRDA and other development agencies outside the control of zilla parishads can prove highly counter-productive.[7] This aspect is also important when, for instance, a scheme requires the interaction and co-operation of several line departments. This can be illustrated by taking the example of National Malaria Eradication Programme (NMEP). In the implementation of NMEP agencies concerned with say forestry, health, environment would need to co-operate and work under the umbrella of one single authority. Also not all the states have provided for inter-tier linkages between various tiers of panchayats in their acts. This may create problems of co-ordination and finalisation of plans prepared, say, by lower levels of panchayati raj bodies, thus adversely affecting the efficacy of the panchayat raj system.[8] Moreover, various political parties will have to arrive at a consensus on the working of PRIs at different levels and the relationship of state government with the various tiers of PRIs.

Thus from the viewpoint of deriving maximum benefits from decentralised governance what is needed is a viable mechanism in which (i) co-ordination between panchayats and technical departments is evolved, (ii) co-ordination between schemes of one department and scheme of other department is ensured and (iii) an organic co-ordination between various tiers of PRIs is fostered. As was pointed out, at present the practice is to have the officers from the technical departments to work on deputation under the control of the executive officers of PRIs. There are of course exceptions to this practice as in some states the line department functionaries are not put under the control of the chiefs of the PRIs. Whichever the system, certain conflicts are bound to arise, especially when line department functionaries are directly under the control of the state headquarters. Some states, like Karnataka have placed all the district heads of various technical departments under the control of the CEO of zilla parishad. These functionaries can be transferred by zilla parishad within the district. Also their annual confidential reports are written by CEO of zilla parishad. The recruitment is with the state department. Similarly in Punjab, except recruitment and punishment, the heads of zilla parishad and panchayat samiti are empowered to exercise the powers of the head of department in respect of employees of the concerned departments engaged in implementing the schemes/programmes entrusted to zilla parishad and panchayat samiti. Further, as in Karnataka, in Punjab too, the annual confidential reports of the district/block heads of concerned technical departments would be written by chairman/CEO/EO of zilla parishad and panchayat samiti respectively.

There is now a view that ideally the PRIs should have their own staff through direct recruitment, although a few may be taken from the state or the parastatals on deputation basis. Whatever the recruitment method one adopts, as far as the discipline is concerned PRIs should be entrusted to enforce it. Also with CEO/EO as heads of PRIs and also exercising control over the district or block heads of line departments, it is quite possible to achieve both departmental and inter-departmental schemes co-ordination. At the moment it is quite difficult to evaluate the functioning of PRIs, particularly their effectiveness in improving the performance of local schemes and projects. However, the broad indications are that the PRIs can play a crucial role in the planning and effective implementation of various schemes/programmes including the functioning of local level institutions. Similarly PRIs can play equally important supervisory and monitoring role in preventive and promotive health care programmes.

V
World Bank Initiatives towards Decentralisation

Over the last two decades or so, the World Bank has supported a number of projects in the population, health and nutrition sector in India. In the course of the implementation of these projects, a number of problems relating to planning and implementation aspects in various projects has arisen. Besides serious problems relating to flow of funds have been experienced. These problems seem to have arisen as most of the projects were formulated adopting the top down approach with little involvement of the local beneficiary population. In formulating the projects, it is usually assumed that the existing health infrastructure and the administrative structure would remain undisturbed. Eventually however, problems in implementation started cropping up. First obstacle was the delays in the disbursement of funds from centre to the states and to lower levels of governance. Also many times, these funds were found to be used for purposes other than for which they were assigned. For example, the project funds in many cases were used by states to pay the salaries and other establishment costs which otherwise is their responsibility. Similarly, the schemes and programmes designed under the project did not match the needs and perceptions of the local population. Thus, many of the project funds remained under – or un-utilised.

Realising some of these problems, recently the Bank modified its approach, and began advocating more and more for a participatory and client-based approach in project formulation. It has also been emphasising greater involvement of both private sector and the NGOs. The induction of the institution of SCOVA and the Family Planning Association of India (FPAI) in many of the later projects assisted by the Bank is an indication of this approach.[4] Also simultaneously, especially with the launching of the disease control programmes such as for blindness, leprosy and tuberculosis, the concept of district societies is being promoted to facilitate flow of funds and better implementation and monitoring. These societies basically serve two purposes. One, they were used to facilitate the flow of funds, and secondly to assist in the monitoring and evaluation of the projects at the grass roots level. However, there is little evidence of the local population being involved into need assessment. Also we find little co-ordination between these district societies and the health department in regard to case detection and surveillance. Indeed some confusion seems to prevail about the precise role of these societies. Moreover, these societies appear to be at best a facilitating mechanism to tide over a specific problem or obstacle. It cannot be termed as genuine participation or decentralisation. However, the programme of malaria control has been decentralised at the grass roots level with involvement of local malaria societies and panchayati raj institutions. The pivotal role was played by malaria link volunteers for delivering the services at the doorstep. Statement 1 details the extent of decentralisation that has taken place in various World Bank assisted PHN Projects (excluding HIV/AIDS project, where the primary focus is on prevention mainly through advocacy and IEC). The statement shows that, except the most recent IDA assisted reproductive and child health project where im-

plementation, monitoring and funds flow are decentralised almost to the grass roots level, no other project has gone any far with decentralisation. Also the participation of NGOs and PVOs has been by and large remained of a limited extent.

The first attempt towards the decentralisation, as has been widely claimed, is perhaps the recent reproductive health project of the IDA assisted government of India project where overnight target-free approach has been adopted.

The new emphasis on a target free approach launched in April 1996 under the new programme on reproductive and child health signals a new approach to family planning and health care of mothers and children. It is a programme of policy reform aimed at integrating family planning with child and maternity care in the primary health care system, making health personnel on all levels client and service-oriented, emphasising quality of service, upgrading technical facilities, and involving the local government and the community, private doctors, and NGOs, etc in the planning, implementation and monitoring of the work. It means that fixed targets in various activities are done away with and replaced by performance indicators, and that overall responsibility for health care in the community is defined by the health workers in accordance with basic goals of RCH, but sensitised to individual needs in the population. In order to achieve this, planning, implementation, and monitoring will be decentralised to the district level and below. The reform policy will involve substantial training of health workers, communicating this change of policy, new attitudes, and style of work that is necessary to make the programme success.

The organisational set up for this reform will build on the primary health care system that has evolved in the country over the last two decades. The basic node in this system is the sub-centre (S-C) in the village, manned by an auxiliary nurse midwife (ANM), and under the control of a lady health visitor at a nearby primary health centre. In many areas, there has already been a programme for training of traditional birth attendants (TBA, dais) to assist the ANM in her work. In about half of the sub-centres there is also a male health visitor (MHW). In the new programme of MOHFW will work on strengthening the role of the community in maternal and child health care and sensitise the male members to gender, HIV/aids, and the need for speedy referral of emergency cases after delivery. For all these workers, training and sensitisation to the new objectives will form an integral part of RCH.

In the RCH project vertical programmes such as CSSM and ICDS are supposed to converge with this primary health care system to provide integrated services to the community. Voluntary anganwadi workers (AWWs, ICDS programme) and their local facilities will be used for the RCH care, co-ordinated by the ANM. Panchayat members, teachers, NGOs, private medical practitioners (allopathic as well as indigenous), women's organisations, youth associations and other concerned members of the community are supposed to participate in the planning and implementation of RCH work.

In some states, though not sanctioned by the central ministry, a voluntary system of health workers is still in vogue. In villages where there are no sub-centres within reach, village health posts (VHP) will be promoted, which are manned by a community health worker (CHW), trained for three months, provided with a basic drug kit, and allowed to charge a fee (rate determined by the gram panchayat) for his services. The CHW will work on an honorary basis, supported by the gram panchayat, and supervised by the ANM at the nearest sub-centres.

The sub-centre (and village health post) connected with a PHC is then connected with an upgraded PHC (at the block level) or a hospital (CHC), that may in some cases serve as first reference unit for medical referral of difficult cases. In RCH most of the money, it seems, will be spent on these higher level centres, to upgrade existing facilities, get access to more drugs, and contract more qualified doctors, all in order to ensure higher quality of essential obstetric care. The sub-centre level and below will not receive the same technical upgrading, but the ANM will be provided with a loan to buy a moped, and subsidised rent to make her stay in the village near the sub-centre. The while systems and its medical and administrative personnel is now supposed to come under the control of panchayati raj institutions.

The *Manual on Target Free Approach* describes how decentralised participatory planning should start with an assessment of the felt needs for public health services in the community. It is the key grass roots health worker, the auxiliary nurse-midwife (ANM) at the sub-centre (SC), who will have to survey the population (by house to house visits or by focused group interviews) and establish to what extent people expect her services. She can then establish the gap that she has to bridge in order to reach full coverage. Her work should, however, be based primarily on the felt needs, while in the long run trying to influence this in the direction of what is called area requirement for full coverage of RCH service. In making the sub-centre Action Plan, the ANM should associate members of the community, such as other health workers, private medical practitioners, indigenous practitioners, ex-servicemen, other public grass roots level workers (including teachers), pradhan of gram panchayat and anganwadi workers.

Also at the PHC level community participation is expected in terms of organising meetings with panchayat members, primary school teachers, women's groups, youth clubs, anganwadi workers, ex-servicemen, etc to prepare the plan and to spread health and family planning messages. The expectation is that this participation of local government servants and community representatives in planning will also lead over to participation in the implementation of the work, and they are also supposed to monitor the work at the sub-centres and primary health centres.

In the instructions, it is stated that the project will be implemented by district authorities/zilla parishad, however, without any guidelines. Funds will be available to PRIs, SCOVA and other grass roots agencies. These first steps are sound in principle but need to be developed much further in the reform process to come.

VI
Critical Areas

The district administration is responsible for planning, organising and supervising the district's family welfare work. While districts may adopt with enthusiasm the new planning procedures, there is a risk that they may not respond equally well to the changes necessary in implementation especially if existing administrative structures and practices continue and tight budget lines as prescribed by the centre are retained.

A more advanced form of decentralisatin in public service delviery would mean conferring greater autonomy not only on the districts, but on the blocks and village adminstrations, and extending even further to the individual service institutations (CHC–PHC–SC). Autonomy should be defined as the freedom to use available resources in a flexible manner to reach optimal results, with the higher administrative and political levels providing only broad directives. For service institutions, this presupposes adequate staff, buildings, equipment, drugs and other supplies, and adequate funds for day-to-day operations. In the final decentralisation stage, the

panchayati raj institutions would exercise their responsibility to provide directions to service institutions.

Supervision of service institutions should be more in the form of support (for example, assistance in problem solving) than control. Performance monitoring can be shared between the line health administration (for technical matters) and the relevant panchayati raj institution (for approving the health plan and assessing its achievement). The decentralisation process needs to be further clarified and a strategy defined for its implementation, particularly at the district level. Specific elements of the decentralisation process that need to be worked out are: (a) The proportion of the state health budget without tied budget lines to be allocated to the district, block and village administrations; (b) The degree of freedom in the allocation of financial resources for various activities at these levels; (c) Autonomy in terms of using financial resources for service delivery institutions; and (d) The individual health worker's actual control over the work situation.

The district health administrators' capacity to manage the new system will also need to be improved. The decentralisation process itself will need to be further developed over a period of time and pilot studies for exploring management issues in terms of decentralisation to block and village level administrations may be instructive.

The main role of PRIs would be to formulate a locally relevant planning policy, and review work programmes and budgets. In additions, PRIs can promote and take action on intersectional integration of services and programmes (sanitation, drinking water, nutrition, primary education, etc) essential to improve the community's health. They can also raise supplementary resources for public health and preventive activities as well as for the maintenance of health centres, referral transports. As local elected bodies they are in a better position to raise local resources (financial, material, human resources) than distant state governments ever could.

Linking the health sector with the panchayat system is a complex chain process involving several actors. Past experience is not encouraging. The PRIs have often been dominated by the local power elite, obstructed by politicians at the state level, and have mostly been seen as advisory rather than decision-making bodies. Allocated financial resources, often insignificant, have been linked to tight budget lines, leaving limited room for local decision-making. The constitutional amendment now being implemented provides different prerequisites and opportunities for change, but resistance can still be expected from metropolitan and regional power elites. The change processes, conventions and rules, therefore, have to evolve over a period of time and over a number of issues: (a) What should be the division of labour between the different tiers of the panchayati raj, i e, the zilla parishad at the district level, the panchayat samiti at the block level, and the gram panchayat at the village level? (b) Which body should control which part of the work plan and budget? (c) Should there be separate health committees at the different levels of the PRIs and should these committees be advisory or decision-making bodies? (d) How should the various administrations at district, block and village level be reoriented, where necessary, to correspond to the new system of self-government? (e) How can women panchayat members be activated, for example, in health matters? (f) How should and could PRIs control health service institutions at the various levels (the health plan, its achievement, etc)? (g) How can PRIs raise supplementary resources for health care?

To take out one example of the issues involved how appropriate and efficient are village health committees? Evidence from Maharashtra's District Primary Education Programme shows that village education committees separated from gram panchayats do not function well. They are controlled by teachers, have scarce funds, and are not known to the public. Similar weaknesses seem to attach to village health committees where they have been formed. Thus the question is whether it is not better to assign the responsibility for health and family welfare directly to the gram panchayats, allocating them adequate resources and providing orientation to their members?

Within each state, a system linking the health administration (including the health service system) with the PRIs will have to be developed. This needs to be a phased reform, taking into the consideration the uneven development of PRIs in the different states. Panchayat members and health functionaries need orientation; and health functionaries need to be involved in the reform process through consultation to allay fears that the new system will affect them adversely (e g, in terms of control over their work situation). During the PPP, each state should, therefore, clarify the pre-conditions for linking the health system with the PRIs and plan a phased reform, taking into consideration the different characteristics of the two systems in the state.

VII
Issues for Discussion

In the end, we would like to highlight the following issues requiring further discussions: (a) To achieve optimal results, what is the degree and the level to which decentralisation should be pursued? (b) How effectively can the panchayati raj institutions be used as vehicle of health care delivery? (c) Is community prepared to shoulder the responsibilities essential for the success of decentralisation? (d) What measures are needed to foster better co-ordination between various agencies, especially between administrative wing and the line departments, and between health department, PRIs and the community? (e) Was a lack of concern in the earlier IDA assisted health projects, a conscious decision or was it the result of inadequate demand for health services, thus justifying the top-down approach?

Notes

[An earlier version of the paper was presented at the workshop on 'World Bank's Role in Health System of India', Sponsored by the Operations Evaluation Department of the World Bank, New Delhi, April 2 and 3, 1998.]

1 Lessel H David's mimeograph paper 'Organisation of Health Services in India - extent of which decentralisation' has considerable details on the subject.
2 Since PRIs are now entrusted with methods listed in the XI schedule a series of changes in the existing arrangements for planning implementation monitoring and review of schemes and programmes relating to these methods would be needed. Administratively, this implies assigning certain schemes and programmes, including human and financial resources to particular tier of the PRI. This in effect would result in placing the concerned departments under the control of district panchayat/block panchayat/gram panchayat.
3 To keep organise co-ordination of different tiers of panchayats, the head of the lower tier is given the ex-officio membership of higher tier body. The local MLA/MP are also made members of the PRIs of the respective tier (a good example is West Bengal).
4 The Standing Committee on Voluntary Action (SCOVA) was set up in June 1986 to promote community participation in rural areas at the grass roots. The Committee included eminent social workers as its members. The idea was to promote well integrated projects with MCH, immunisation and family planning services for the improvement of health standards.

The Search for Flexibility in Indian Manufacturing

New Evidence on Outsourcing Activities

K V Ramaswamy

This paper provides estimates of production subcontracting in Indian manufacturing industries as a source of flexibility. Data on 84 three-digit industries within the organised manufacturing sector is used here. An index of subcontracting intensity is introduced and it is shown to have increased in aggregate manufacturing between 1970 and 1992-93. It is shown that subcontracting practices are concentrated in labour-intensive industries and greater in industries producing consumer non-durables. A non-linear relationship between factory size and subcontracting intensity is postulated. Regression estimates supported the hypothesis. Organisational diseconomies associated with large employment size seem to result in greater subcontracting.

I
Introduction

INDUSTRIAL firms in India are widely perceived to lack the necessary flexibility to respond to changes in markets and technology. The regime of state-directed industrialisation and labour policy is held responsible for having imposed rigid rules on firm management decisions. Labour laws and job security regulations, it is argued, have made labour use by large industrial firms inflexible [Chaudhary 1996]. Industrial regulatory policy has been restrictive until recently of choice of capacity expansion, product mix and location decisions of large firms. Technology policy worked to limit foreign technology purchase, duration of technology agreements and royalty payments. Liberalisation of industrial policies first initiated in the 1980s relaxed the constraints on firm entry, expansion and diversification decisions. Industrial sector's transition towards greater market orientation has gathered momentum with the comprehensive reform of industrial and trade policies introduced since August 1991. The objective of reforms is to enable Indian firms to improve efficiency and competitiveness. Labour market institutions, however, have remained outside the reform process.

In this context the interesting question is how firm management strategies have responded to the evolving product and factor market changes? During the period 1963-64 to 1978-79, it is observed that domestic competition sharpened with an increase in the number of firms in both homogeneous and differentiated markets.[1] With the relaxation of capacity licensing and import restrictions in the 1980s industrial markets experienced greater domestic and import competition often with many players with foreign technological collaboration [Jacobsson 1991, World Bank 1996]. The entry of multinational firms has further contributed to effective competition across industry groups. Factor markets also underwent changes with a steep rise in real interest rate since 1980 and the estimated cost of capital of medium and large companies showed a rising trend [Nagaraj 1994]. Labour markets present a mixed picture. Real wages per employee has risen rapidly in the 1980s than in the 1970s.[2] In the 1980s union density declined and the number of workdays lost due to lockouts by management rose relative to workdays lost due to strikes. The growth of organised manufacturing employment decelerated and employment elasticity of output turned negative.[3] The unorganised sector accounted for most of the manufacturing employment.

The fall in the elasticity of employment with respect to output in large factories is partly attributed to the rigidity of regulations governing factory employment.[4] Industrial Disputes Act (IDA, 1976) stipulated that factories with more than 300 workers are required to take permission from the government before retrenching workers. The amendment to IDA in 1982 required all factories with more than 100 workers to take permission from the respective state governments before laying off or close the factories. The observed fall in labour demand is confined to large factories. Micro economic studies have documented the widespread use of market mediated work practices and outsourcing of products.[5] It includes greater use of contract, temporary and casual workers, on site labour only subcontracting and production subcontracting among others. Aggregate data shows that the share of casual workers in large factory employment rose from 4.6 per cent in 1980-81 to more than 12 per cent in 1993-94. It is primarily the strategic response of management to changes in both product and factor markets.

The use of outsourcing reflects the search efforts on the part of large firms to gain new margins of flexibility in increasingly competitive markets. However, there is little quantitative evidence on the extent of production subcontracting across industries and its associated industry characteristics.[6] Therefore the significance of subcontracting as a source of flexibility to industrial firms remains ambiguous. This paper perhaps for the first time provides estimates of production subcontracting in Indian manufacturing industries. We use data on 3-digit industries within the organised manufacturing sector. We introduce an index of subcontracting intensity. We show that subcontracting practices are concentrated in labour intensive industries, greater in industries producing consumer non durables and in industries with plants below the median employment size. The relationship between factory size and subcontracting intensity appears to be non linear. Organisational diseconomies associated with large size seem to result in greater subcontracting. Subcontracting contributes to higher measured value addition in large factories.

Following this introduction the present paper is organised in four sections. We begin by briefly reviewing the nature and determinants of subcontracting in Section II. Section III presents the evidence on the growth and inter-industry distribution of subcontracting practices. Section IV explores the relationship between factory size and other correlates of subcontracting. Section V contains the conclusions.

II
Nature and Determinants of Subcontracting

We define the term subcontracting to mean the manufacture of goods by one firm for another based on latter's specifications [Lazerson 1990]. This differs from a narrower UNIDO (1974) definition which states "a subcontracting relationship exists when a firm (the principal) places an order with another firm (the subcontractor) for manufacture of parts, components, sub assemblies or assemblies

to be incorporated into a product which the principal will sell. Such orders may include the treatment, processing or finishing of materials or parts by the subcontractor at the principals request" (cited in *Productivity*, vol 35, 1995). Our definition encompasses transactions where the principal firm places an order either for the whole product or parts of the product, which it either sells directly to the consumer or incorporates into the product that it manufactures. Contract manufacturing perhaps correctly captures the nature of the transaction. Two main forms of subcontracting are commercial and industrial subcontracting. In commercial subcontracting the role of the principal firm is limited to marketing and distributing the subcontractors finished product. The principal firm itself may not be engaged in the manufacture of that product.

The essence of subcontracting is that one or more firms must mediate the relationship between the subcontractor and the final user of the product/end market [Lazerson 1990; Holmes 1986]. The extant literature tends to focus on vertical inter-firm relationships and in particular between small and large firms (well known is the one between small component suppliers and auto manufacturers). Equally important and of recent origin is the horizontal subcontracting that takes place between two firms operating at the same horizontal stage of the vertical chain of production. This is not confined to small-large variety. Two large (even rival) firms are found to engage in subcontracting arrangements. For example, Videocon supplying Power Wash machines to Godrej-GE. Suppliers of refrigerators, electric fans, thermo-ware steel furniture and domestic electric appliances constitute the numerous instances of horizontal subcontracting between large and small firms. It is possible to distinguish a number of subspecies of subcontracting arrangements between firms. In Japan subcontractors of the various automobile manufacturers are organised into tiers, with lower tier subcontractors supplying higher tier subcontractors. It is argued that in response to changing market conditions subcontracting has emerged as an alternative strategy to vertically integrated production in developed countries [Lazerson 1990]. What are the determinants of subcontracting arrangements?

Technology and demand: This is a traditional view which emphasises production costs and different minimum efficient scales (MES) of different stages of production. As market expands for the downstream products, specialist upstream firms can exist to achieve optimal scale causing disintegration of production.[7] Young industries tend to be vertically integrated and the tendency to disintegrate becomes stronger with the expansion of the industry demand over time. Specialisation subcontracting is the predominant form of subcontracting in North America and Japan.

Transactions cost: Subcontracting as a form of production organisation is the outcome of a firm's decision to 'make or buy'. Industrial organisation theory has suggested several answers to the question of internal organisation of production against market purchase. Coase and Williamson argue that the minimisation of transaction cost is a major concern in the design of production organisation. Transaction costs include search costs of finding information about prices and quality of products, writing and enforcement of contracts and the costs of monitoring performance. When transaction costs are high the firm will decide to organise the production of the product in-house rather than purchasing it from the market. In this perspective, the firm is viewed as an alternative to the market as a mechanism for governing transactions. In young industries, with specialised needs and supply unreliability, contracting costs would be high favouring vertical integration. Once the industry matures and products are standardised, the firms would begin to outsource [Levy 1984]. Early observers of Indian industrial growth noted the relatively high vertical integration of Indian industries. Further, disintegrated production takes place when governance costs of integrated production rise, say, due to poor labour relations. In brief, regulations raising or reducing transaction costs for an industry would deserve attention.

Labour market: Segmented labour markets divided into formal and informal segments is supposed to be a major determinant of outsourcing of product as well as labour. Formal sector employment is well paid, governed by long-term contract, subject to government regulations and trade union pressure. Informal segment is outside the job security regulations, pays lower wages, free from union wage agreements, and escapes government regulations on health and safety. Institutional factors may have contributed to the widening of the wage differentials between large and small firms in recent years [Mazumdar 1988]. Subcontracting is reported to be the typical response of large unionised firms in India. To quote, "The farming out is so extensive in some cases that the firm's own employees have been reduced to a fraction of its total employment, and the character of the firm itself transformed from a manufacturing to a trading one" [Ramaswamy 1988:3]. It is reported that unions perceive that their threat to strike would be weakened if the management has an option to augment production from other sources [Deshpande 1997]. Even the non-unionised but high wage firms may find it attractive to farm out certain peripheral activities using low-skill work.

Demand uncertainty and business strategy: Industries may face demand uncertainty due to cyclical or seasonal variations. This encourages capacity subcontracting by large firms. Current demand in excess of installed capacity would be met by outsourcing from the subcontractors. In-house production of transitory demand may be uneconomic due to costs of varying the regular workforce, costs of excess employment and capacity during recessions.[8] Small firms function as a buffer to cyclical fluctuation of industry demand. In India organised sector firms are reported to shift the transitory demand for their products to unorganised manufacturing.[9]

The sources of greater uncertainty in product markets are increasing competition, product differentiation and niche markets. Subcontracting is a means of reducing the risk associated with expanding production. Competition among subcontractors keeps their supply costs low and enables the parent firm to expand or contract production over a wide range of possible output without affecting marginal cost [Scott 1983]. Subcontracting enables the firm to take better advantages of the division of labour, shed marginal activities and focus on few core functions. Given that entry and exit costs are high, large firms often use subcontracting to test markets for new product lines with a view to reduce entry costs.

State policy: State policies restricted the growth of large domestic firms and firms with foreign equity.[10] At the same time state policy encouraged small-scale factories through product reservation and other promotional measures like concessional credit for fixed and working capital and fiscal incentives. Small-scale sector was not subjected to capacity licensing. A large number of products were reserved exclusively for small-scale producers and

TABLE 1: INDUSTRIES WITH HIGH SHARE OF CONTRACT LABOUR
(Percentage of Total Employment in Census Sector)

arge firms were not allowed entry into hose product lines. The first policy forced arge firms with frozen capacities to outsource additional output. The second policy facilitated outsourcing by creating a small-scale sector capable of producing numerous intermediate and final products with simple technology. Small firms mostly obtained the technology from their customer firms and equipment suppliers [Desai and Taneja 1991]. The scrutiny of annual reports of large business houses and foreign equity companies revealed ownership of plants in the small-scale sector [Goyal, Rao and Kumar 1984]. Exemption from payment of excise tax has been the most attractive fiscal incentive for small firms. The value of this incentive scheme is found to be very high as rates of duty varied from 15 per cent to 105 per cent. Attempts to rationalise indirect tax structure began only in the 1990s.

Evidently multiple causes operate behind the spread of subcontracting practices. One may note that specialisation subcontracting is vertical in nature and capacity subcontracting is essentially horizontal subcontracting. Reported surveys of small firms, case studies and anecdotal evidence suggest that subcontracting in Indian manufacturing has grown rapidly in recent years. In the next section we attempt to estimate one possible measure of subcontracting intensity and its significance as a source of flexibility in a cross-section of industries.

III
Empirical Measurement of Subcontracting: Issues and Estimates

The balance sheets of companies do not report the value of products produced in house during the year and that is bought-out separately. We need separate data on components/products bought out and incorporated in the company's final product and that product which is bought out but sold directly to the final consumer perhaps after stamping the company's brand name. The most widely used data on industries in India is the Annual Survey of Industries (ASI). The ASI is based on data collected from factories, under the Factories Act, 1948, with more than 10 workers.[11] The census sector of ASI covers factories with 50 workers and above using power and those with above 100 workers without power. Data in somewhat greater detail is available at 3-digit level of national industrial classification (NIC) for selected years. The ASI data presents estimates of value added by subtracting the gross value of inputs from the gross value of output. From our viewpoint the following two categories deserve attention. First, sale value of goods sold in the same condition as purchased. Second, contract and commission work done by others on materials supplied. We believe that data on these two types of transactions may be regarded as significant measures of subcontracting activity of factories in the registered sector. The first transaction is suggested to capture trading activity of small firms [Goldar 1988]. For registered factories, subject to auditing, we believe that it does not stand for trading transaction.[12] Consider the following two examples: Factory G purchases finished steel bookracks from an informal sector factory and sells it as its own, after stamping its brand name. The same factory also buys rolled steel as input but sells to another factory. The second example is a clear case of trading activity but under the sales tax provision can not be shown as sales revenue. We argue that reported data on 'sale value of goods sold in the same condition as purchased' essentially captures the transaction indicated by the first example.

The definition of net value added is as follows:

NVA = Total Output – Total Input

where,

Total Output = Value of products manufactured + Electricity produced and sold + Addition of stock of goods + Own construction + Sale value of goods sold in the same condition as purchased + Industrial and non-industrial services rendered for customers.

Total Input = Fuels, Electricity, etc, consumed + Materials + Contract and commission work done by other concerns on material supplied + Purchase value of goods sold in the same condition as purchased + Others.

We have taken the value of goods sold in the same condition as purchased as measure of the value of subcontracting. And its share in value added (or in the value of output) as an index of subcontracting intensity. It measures the degree of product subcontracting in an industry.

Labour contracting and putting-out are the other two important forms of subcontracting practice. We have some estimates of their importance in different manufacturing industries. We shall present them first in order to put our study on product subcontracting in perspective. Table 1 presents data on five industry groups with more than average share of contract workers in total employment. The use of contract labour has registered the largest increase in two industries, namely, beverages and tobacco, and non-metallic mineral industries. Bidi-making (local cigarettes) which is part of beverages and tobacco is most intensive in labour use and traditionally contract labour dominates bidi manufacturing. Similarly, brick-making and metal casting industries are major users of contract labour and this gets reflected in the high estimated ratios of contract to total labour in non-metallic and basic metal groups. The rising trend is also observed even in new industries like food products and chemicals. This is consistent with the reported trend towards labour contracting for non-core activities like cleaning and maintenance, packaging, welding, painting and warehouse activities. This represents one facet of management response to changing market conditions.

Industrial firms also supply raw materials to other factories for treatment, finishing and processing. This is one form of traditional putting-out production in which the firm chooses the labour-intensive activity for outwork. Data on the value of work done by other concerns (factories/workshops) on material supplied is a measure of the value of subcontracting activity. For large factories, the value of such activity constituted 5.3 per cent of value added in 1973-74. It is around 4.5 per cent in 1992-93. For the registered manufacturing sector it is estimated to be around 8 per cent in 1983-84 and 7 per cent in 1993-94. For large factories in 1992-93, we estimated it to be 56 per cent of value added in textile garments (265) and the value of such activity exceeded

Census* =Factory with more than 200 workers.

the reported net value added in the industry group manufacture of fabricated metal products (340). Excluding these two industries this type of subcontracting activity is quantitatively insignificant. Therefore, it would not have been a significant source of labour flexibility.

Our index of subcontracting intensity, as noted above, is the ratio of the value of goods sold in the same condition as purchased to value added. Table 2 presents the estimates of subcontracting intensity in different segments of manufacturing at different time points, which is based on data availability. Subcontracting was not a significant activity in 1970. By 1978 it has gained prominence for large factories with a share of 21 per cent.[13] Note the change in the definition of census sector in 1978 and 1992-93. Consequently, they are not comparable. However, the data clearly suggest that for large factories subcontracting is a significant activity.

Large factories (those with more than 50 workers) dominate the registered factory sector in terms of output and employment. This further suggests that small firms do less of subcontracting. Using the results of the Reserve Bank of India (RBI) survey of small-scale units for the year 1977, we estimated the subcontracting intensity for the small-scale sector. It is found to be only 0.53 per cent. The share of subcontracting for the factory sector has shown an increase of 3 percentage points during the period 1983-84 and 1993-94. Note that during this period real value added of the factory sector recorded an average annual growth rate of 7.8 per cent. We shall focus on the industry level estimates at three-digit level of disaggregation for the year 1992-93. This covers all factories with more than 200 workers.

We estimated the subcontracting intensity for 100 three-digit industries. Table 3 shows the distribution of industries by their subcontracting intensity. Which industries are relatively subcontracting intensive? What are their associated characteristics? In Table 4, the subcontracting intensity of selected industries are presented. They are in fact the top ranking three-digit industries in five use-based classifications of industry groups, namely, basic goods (BG), capital (K), intermediate (Int), consumer durable (CD) and consumer non-durables (CND). They are consistent with our a priori expectations based on anecdotal and sample survey results reported in the literature. The average subcontracting intensity and the other relevant characteristics of five use-based industry groups are shown in Table 4.1. Consumer non-durables have the highest subcontracting intensity and their average labour intensity is also the highest. Their share in value added is also high and next only to the basic industries. Intermediate industries present a contrasting picture with lowest subcontracting intensity and value-added share. Capital goods and consumer durables have similar subcontracting intensity and labour intensity. The median employment size of the industries is lowest in consumer non-durables and largest in basic goods. Basic goods represent process technology and continuous flow methods of production in contrast to consumer non-durables in which batch production methods seems to be widespread.

IV Correlates of Subcontracting Intensity

What are the correlates of subcontracting intensity? Is there an association between average factory (plant) size and subcontracting intensity? Does greater subcontracting intensity leads to higher measured efficiency of large-scale factories in terms of value added to output ratio?

The size of plant within industries is an important indicator, which is supposed to be capture the effects of scale, technology and organisational mode. We estimated the average employment size of factories of the above industries after eliminating 16 industry groups.[14] The median employment size of factories is found to be 456 workers for this set of 84 industry groups. Table 5 presents the average values of certain selected variables for two groups of industries, namely, those industries with less than median employment size (Group I) and those with a factory size, which is greater than the median employment size (Group II). Group I industries can be seen to have higher subcontracting

TABLE 5: AVERAGE PLANT SIZE OF INDUSTRY AND ECONOMIC CHARACTERISTICS IN 84 THREE-DIGIT INDUSTRIES

	Less than Median Employment Size	Greater Than Median Employment Size
Subcontract value/ value added	38.7	20.6
Subcontract value/output	7 1	4 7
Fixed capital/ labour	Rs 3,82,000	Rs 1,92,000
Average employment size	356	670
Labour per unit of value added	0.78	0 45

TABLE 4: SUBCONTRACTING INTENSITY IN SELECTED INDUSTRIES

(Percentage)

Industry Code and Name	Subcontracting Intensity
331 Semi-finished iron and steel products (BG)	52
217 Prepared animal feed (Int)	112
234 Weaving and finishing of cotton textiles on powerlooms (Int)	110
366 TV receivers, radio broadcasting equipment, microphones, record players, cassette players, audio and video tapes, etc (K)	79 4
368 Electronic valves, tubes, capacitors, circuits and other electronic equipment (K)	59 4
350 Agriculture machinery and equipment and parts (K)	37.5
335 Refrigerators, air-conditioners and Fire fighting equipment and parts (CD)	115
342 Metal furnitures and fixtures (CD)	30.7
363 Electric lamps (CD)	55 4
374 Motor vehicles and parts (CD)	17.5
387 Stationery articles (CND)	180 2
211 Vegatable oil and fats (CND)	210
214 Coffee and instant coffee (CND)	103
202 Canning and preparation of fruits and vegatables (CND)	178
265 Textile garments (CND)	32
304 Drugs, medicines and allied products (CND)	64.5
305 Cosmetics, soaps, detergents, shaving products, tooth paste and toilet preparations (CND)	78.8

Note. Author's estimates based on ASI 1992-93 (census sector).

TABLE 4 1: SUBCONTRACTING INTENSITY BY USE-BASED INDUSTRY GROUPS

Industry	Subcontracting Intensity	Labour Per Unit of Value-Added	Value-Added Share (Per Cent)	Median Employment Size of Industry
Basic goods	16	0.4	33	771
Intermediate	9.7	0.7	9	430
Capital goods	19	0.5	17.5	540
Consumer non-durables	33.5	0.9	33	356
Consumer durables	20	0.6	7.5	553
All industries	31	0.5	100	464

Note: Author's estimates based on ASI 1992-93 (census sector).

shares, lower capital assets per worker and higher employment per unit output. This suggests a positive association between subcontracting intensity and labour intensity. What motivates labour intensive industries to prefer higher subcontracting intensity? The reasons could be several. First, for that industry the significance of labour cost savings, in terms of wage and non-wage benefits, could be higher. Second, the transaction costs in terms of contracting costs of labour imposed by labour legislation and costs of monitoring labour performance is perhaps higher.[15] Third, the technology of the industry is more oriented or more amenable to subcontracting because of feasibility of subdivision and separability of activities.[16]

The relationship between factory size and subcontracting intensity raises an interesting analytical issue. There are gains from economies of large size operations. Size also entails organisational diseconomies. The sources of diseconomies may be information and co-ordination problems in a large organisation, loss of span of control and monitoring costs.[17] In regulated labour markets there may be diseconomies of large employment size in terms of hiring and firing costs. Industrial firms can be hypothesised to choose subcontracting at a point when gains from technological scale economies are offset by organisational diseconomies of size. Consequently, the relationship between employment size of factories and subcontracting intensity can be non-linear. The similarity to cost and output relationship in the neo-classical theory of production is obvious. As factory size increases subcontracting intensity first declines, reaches a minimum point and then begins to rise again. We assume that this relationship is quadratic in functional form. We have regressed subcontracting intensity of the 84 industries on their average factory size and size squared. Size is measured by employment and subcontracting intensity by the share of subcontracting value in total output.[18] The results are shown in Table 6 along with other estimated regressions.

The estimates, in column 1 of Table 6, are consistent with our a priori expectations about the nature of relationship between subcontracting intensity and factory size. Subcontracting intensity reaches its minimum at a factory size of 820 workers.

Our data is a cross-section of industry groups. In order to control for inter-industry differences in size structure we introduced an estimate of relative size of large factories and re-estimated the equation. The index of industry structure (IIS) is the value-added share of census sector (factories with more than 200 workers) in the registered factory sector in that industry group. A high share of census indicates the dominance of large factories in that industry and the scale and size dominated nature of technology. A lower share indicates the co-existence of large and small factories and scale neutrality of technology. Consequently a possible greater scope for subcontracting activity. We assume that small-large type dominates the subcontracting relationships in an industry. Hence we expect a negative association between the index of industry structure and subcontracting intensity. The estimates, in column 2 of Table 6, show a negative and significant coefficient for the IIS variable. The coefficients of factory size remain unaffected. We also observed a weak but positive and significant correlation (+.31) between IIS and the capital intensity of the industry.

A related question is the behaviour of capital intensity of factories with a change in employment size.[19] This needs to be consistent with our postulated relationship between subcontracting intensity and factory size. If a rising employment size of factory results in organisational diseconomies then we should observe, *ceteris paribus*, capital stock per worker to fall as employment size increases. The regression estimates, in column 3 of Table 6, is consistent with this proposition. The coefficient of factory size is positive and the coefficient of size squared is negative. Both are statistically significant. The maximum value of capital intensity is found at a factory size of 973 workers.

The ratio of value added to output is regarded as an index of vertical integration with several weaknesses [Hay and Morris 1984]. It partly reflects inter-firm differences in efficiency and competitive conditions. Perhaps it may be useful to consider it as an index of profitability of the production operations. From a definitional viewpoint (see above) higher subcontracting intensity should result in higher ratio of value added to output. The estimates of the regression, in column 4 of Table 6, support this hypothesis. After controlling for differences in IIS, subcontracting intensity improves the value-added ratio of large-scale factories.

V
Conclusion

Large industrial firms in India, till recently, worked in an environment of control and regulation. They were subject to capacity restrictions and labour market regulations. Subcontracting of final products, components, services and labour by large firms are known to be widespread and are believed to be rapidly growing. The practice of subcontracting is an indicator of the search efforts of firms to gain new margins of flexibility in competitive markets. We introduced and estimated an index of product subcontracting intensity. We showed that subcontracting intensity has risen in aggregate manufacturing. Putting-out production or traditional subcontracting, based on material supply to other factories, has not been a major source of flexibility. The industry group consumer non-durables is found to have the higher subcontracting intensity compared to basic and intermediate goods. The latter represent process technology and continuous flow methods of production in contrast to consumer

non-durables in which batch production methods seems to be widespread. Subcontracting intensity and labour intensity are found to be positively associated. Both technology and labour market regulation are identified as sources of higher subcontracting activity of factories using more labour per unit of output. We tested the hypothesis that subcontracting intensity and factory size are non-linearly related similar to cost and output relationship in the theory of production. Regression estimates supported the hypothesis that subcontracting first falls and then rises with employment size of factories. This is attributed to the organisational diseconomies of large factories. Our study is based on aggregate industry data at the 3-digit level. Our results need to be further tested using firm level data within individual industries.

Indian industry is in the process of restructuring to improve competitiveness. In this context subcontracting would be an important strategy of large firms. It is also a major source of flexibility. In course of time there would be qualitative shift in the nature of subcontracting perhaps with an emphasis on the use of skilled labour and specialisation rather than on taking advantage of poor labour standards in the small-scale factories. To the extent that subcontracting is a response to the constraint of labour regulation, the method and the process of labour market reforms may need greater attention.

Notes

[I gratefully acknowledge the comments received from R Nagaraj and Tirthankar Roy. I wish to thank Chiranjeev Gupta for research assistance. Special thanks to Shyamprasad and S S Doshi for their help in understanding company accounting practice. I take responsibility for all errors and interpretations. 1 See Desai (1985) for pursuasive discussion in terms of small and large group industries.
2 Ghose (1994). This is true only with respect to factories with greater than 100 workers.
3 Ghose (1994). Recent unpublished study by Bishwanath Goldar, Institute of Economic Growth, New Delhi, reports that during 1988-94 employment elasticity of organised sector recovered to turn positive.
4 Till date there has been no econometric evidence in support of this hypothesis. Fallon and Lucas (1993) claim to have shown the negative impact of job security regulations. Their evidence is weak and can be contested on several grounds. An alternative hypothesis points to the changes in product mix in favour of capital intensive industries, greater product market competition inducing efficiency and the nature of investment (modernisation) as major factors. Explaining the deceleration in aggregate manufacturing employment is a separate exercise and not pursued here.
5 Bhushan (1985) and Ramaswamy (1988). Nagaraj (1984) presents a descriptive survey.
6 "For various reasons, subcontracting is the most closely held secret in the corporate world", statement by the managing director of Parle Agro company, cited in *Business India*, September 12-25, 1994.
7 This idea was first suggested by Stigler (1968) based on Adam smith's proposition that "the division of labour is limited by the extent of the market."
8 Abraham and Taylor (1997) present evidence for American manufacturing firms.
9 See Banerjee (1988) for an example from Electric fan industry.
10 Under MRTP and FERA acts.
11 Factories with 10 workers with power and factories with 20 workers without power.
12 Sale of excess stock do take place but it is not equivalent to trade in intermediate inputs.
13 An important factor is that due to change in excise tax law in 1975 the number of products subject to excise taxation increased covering a large number of industrial products. Small-scale firms are exempt from the payment of excise taxation inducing large factories to outsource to gain the fiscal advantage.
14 The following criteria is used to eliminate the industry groups: (1) zero value of goods sold in the same condition as purchased, (2) net value added is negative, (3) reported value of any variable (say, wage bill) is greater than that value reported for the factory sector, (4) any extremely large ratio of a variable.
15 Is trade union density and strike activity higher in labour intensive industries? No evidence seems to exist for this proposition.
16 It is pointed out that subcontracting intensity seems to be correlated with the nature of the market rather than supply-side considerations, in export intensive industries like garments and leather. This logic correlates distant markets with subcontracting in labour intensive industries. We have not explored this possibility except to note that export intensity of our set of industries is rather insignificant except in garments, leather and food products like coffee.
17 See Holmstrom and Tirole (1989) for a survey.
18 The correlation between the two measures of subcontracting intensity, namely, sale value of goods sold in the same condition as purchased as a proportion of value added and as a proportion of output is highly significant at .76.
19 It is well known that the relationship between firm size (or plant size) and factor intensity is an empirical question.

Language, Literature and Nationalism: Case of Hindi

Why did a certain form of Hindi come to be identified as the future national language and how did it become hegemonic? Were there other varieties of Hindi and did they mirror different views of the nation and the political community? The ways in which ideas about language and literature reflected attitudes to the 'public' among Hindi writers and activists in pre-independence India and the institutional space and impact these ideas had 409

Trade and Industrial Growth

Theory says that freer trade encourages economic activity and raises production and employment. Has this been true in the Indian case? An examination of the statistical evidence. 417

Rent Laws and Housing Crisis

Anachronistic rent laws have been the biggest deterrent to investment in the housing sector and increasing the availability of housing. Since the political parties in power at the centre and in the states have been bent upon pursuing populist policies for the last 50 years, the battle to get a sensible law on the statute book has now once again had to be taken to the Supreme Court 387

Agrarian Change and Backward Castes

Both structural and political tendencies have worked in favour of the emergence of the backward castes at the grass roots level in south Telengana in Andhra Pradesh. The absence of a green revolution and lack of development of productive forces eroded the hold of the erstwhile dominant castes and helped the backward and lower castes to emerge to take political power. The process has been buttressed by the electoral reservations following the 73rd constitutional amendment 425

Indians in South Africa

Ever since their arrival in Natal in 1860, the political and economic history of Indian South Africans has been largely shaped by struggle and resistance on the one hand and by compromise and accommodation on the other. What does this imply for the second democratic elections which have to take place before the middle of this year? 393

Plan/Non-Plan Conundrum

The division of total revenue expenditure into plan and non-plan and the division of responsibilities between the Planning Commission and the Finance Commission have become important issues in federal financial relations. A discussion of the constitutional, institutional and practical aspects and the impact of the dichotomy on fiscal discipline among the states 431

Human Rights and MNCs

Nothing remotely comparable in research or analysis to the Human Rights Watch's report on the Enron Corporation has been published in India 385

Wrong Focus

One of the disconcerting aspects of fiscal management since the beginning of the stabilisation programmes in 1991-92 has been the failure to focus on correcting the growing revenue deficit of the central government. The focus instead has been on reducing the gross fiscal deficit without taking into account the structure of financing of this deficit. 378

Andhra's Dreams

The aim of Chandrababu Naidu's *Vision 2020* is to present a coherent agenda for action. A long list of objectives has been prepared and gathered together under appropriate sectoral heads covering social and economic goals. Several doubts remain, however. 391

Present as Past

There is a tendency to oversimplify history and project backwards current notions of conflict among Hindus and Muslims into the past. It is necessary instead to examine historical events in their richness, depth, complexity and ambiguity to better understand the nature of the current tensions. 396

Remembering Sachin

IT was sometime in June 1960, when I was a student in the Bombay School of Economics doing my final MA that I walked into the chamber of Sachin Chaudhuri in Apollo Street without even asking his permission or even an appointment. Hannan Ezekiel was my teacher and used to teach economics of public utilities and transport. He wrote regularly for the *EW*. Air transport had just been nationalised and I had written a small piece on 'Aviation since Nationalisation' and had taken the piece to Sachin Chaudhuri. He was chewing pan, and was in spotless white starched khaddar-kurta and did not talk to me, but smiled. I stood before him gazing at his table which was just a small wooden plank with several books and papers functionally disorganised all around. He was searching for something and eventually took out an FAO publication on fishing in Hong Kong and Konkan coast. He did not even talk about my piece on aviation and just said "you take this report and make a review of this in two pages". I was already sweating in the humid climate of Bombay but took courage to say "yes sir" and walked out with a feeling of dejection and joy at the same time – the joy of meeting him and being able to tell my friends that I had met Sachin Chaudhuri and that he had asked me to review a book for the *EW*. As a student it was an achievement. Then after a month or so I went back and gave him the review and he said 'good'. When after several months I saw my piece appearing as 'Fishing in Bombay and Hong Kong – A Contrast' my joy knew no bounds. After that I read *EW* for many years. When I was confused about my career choice between a research career and the Karnataka Administrative Service in the 1960s I wrote to Sachin Saab and asked his opinion. Prompt came his reply and he said. "The character of administration in India is changing, and should change, and one can write better by being in a system than outside" and he advised me to join the administrative service. Since 1960s I am an *EW* and later *EPW* fan. I have continued to meet Krishna Raj then and now. The *EW* then and *EPW* now, are not journals but institutions. If we want a tradition of scholarship, knowledge and critical enquiry to flourish in India, we have to strengthen institutions like *EPW*.

MANU KULKARNI

Bhopal

Bajrang Dal in Orissa

CLOSE on the gang-rape of Anjana Mishra – inspired by the ruling Congress(I)'s desire to silence the opposition to the ex-advocate general in Orissa – comes the news of the gruesome murder of Staines and his two small children. It is worth noting that Graham Stewart Staines had been selflessly working here for more than three decades among the lepers, something that very few of us Indians would even dream of doing today. The Australian leprosy mission, with which he was associated, had been founded in the early years of this century at Mayurbhanj, then a princely state. Never even during the period of the anti-imperialist struggle and mass movements in Orissa were such outposts of compassion, dedicated to the service of the poor and the outcastes of society, exposed to such treatment. In fact, the mission's association with one of Mahatma Gandhi's dreams, that of eradicating leprosy, had earned for it a lot of love and respect among the local population.

It is indeed a bitter irony that the Sangh parivar decided to 'thank' Staines in this fashion. It is equally ironic that while the prime minister has been calling for debates on conversions his men go on such barbaric rampages. It seems the Sangh parivar has now decided to strike at Christians in the country. Since its perverted anti-national political thinking cannot survive without locating enemies and spreading hatred and its anti-Muslim tirade seems to have been far too costly in electoral terms, it has now turned against the Christians. Justifying rapist attacks on nuns, tribal Christian converts and churches harmonises perfectly with the legitimacy provided by the leadership of the fascist outfits which locate missionaries and Amartya Sen (thank God Mother Teressa is not there to be branded in this way) as agents of 'Christian imperialism'!

One can only hope that these murderers and criminals are brought to book according to the law of the land and the people in this democratic country reject these fascist, inhuman and anti-national forces.

BISWAMOY PATI

New Delhi

ECONOMIC AND POLITICAL WEEKLY

Planning the Commission

THE Planning Commission has been revamped and given a new deputy chairman. The Ninth Five Year Plan too has been approved by the cabinet and now awaits the formal imprimatur of the National Development Council which is to meet next week after a gap of more than two years for that purpose. The funny thing is that the Plan covers the five years from April 1997 to March 2002; in other words, it is being cleared as it is about to enter its third year. The oddity has, however, evoked scarcely any comment, perhaps because there is the far bigger conundrum of what a five year plan said to run to a stolid 1,313 pages in two volumes is supposed to mean after almost an entire decade of economic reforms.

But no, the Planning Commission is not quite a bunch of Rip Van Winkles. There are apparently prefixed to the Ninth Plan document a few pages on 'Development Strategy' where it is quite plainly proclaimed that "[w]ith the progressive deregulation of the economy and the larger role of the private sector and market based decision making, planning methods based on input-output balances for each industrial sector have become less relevant. The notion of a deterministic relationship between the Plan and economic performance" too has apparently been given the go-by and instead the planning process now "focuses on planning for policy so that the signals that are sent to the economic system induce the various economic agents to behave in a manner which is consistent with the national objectives". Unfortunately, a resemblance, if any, between these sentiments and the rest of the massive bulk of the Ninth Plan document and, more important, the actual day to day preoccupations of the Planning Commission is, as they say, purely coincidental.

As far as can be made out from the available details, in the time-honoured tradition the focus of the Plan is on targets, aggregate and minutely sectoral, of growth, outlays and so on. The outcomes in the first two years of the Plan have been generally way off the mark. But no matter, from the third year onwards everything is expected to get back on the pre-ordained path. For instance, the growth rate of the economy is estimated to have been 5 per cent in 1997-98 and 6 per cent in 1998-99, well below the Plan's original target of 7 per cent. Sad no doubt, but for 1999-2000 and the rest of the Plan the growth target is back to 7 per cent so that over the five years as a whole the growth rate can be put at a respectable 6.5 per cent. Similarly, the Plan's target for the central government's fiscal deficit is 5 per cent of GDP, whereas in the first two years it is expected to be over 6 per cent. No matter, once again in the remaining three years the deficit would be magically brought down below even 5 per cent, in fact to as low as 4.1 per cent in the Plan's last year.

The Plan quite rightly emphasises the importance of expanding employment, pointing out that though the rate of population growth may have begun to taper off, the growth of the labour force would be more rapid in the Ninth Plan than in any earlier Plan period and over the 15 years between 1997 and 2012 the size of the labour force would grow from 397 mn to 563 mn. What follows is typically a parade of growth targets: GDP growth of 6.5 per cent per annum in the Ninth Plan to be followed by 7.7 per cent in the next Plan and 8.1 per cent in the one after that, agricultural growth of 4.8 per cent per year over the 15 year period (with foodgrain production going up from 199 mn tonnes to 337 mn tonnes and corresponding figures for virtually every other crop), growth of manufacturing by 9.6 per cent per annum and so on and so forth. If the point is that rapid growth is essential for employment expansion, then of course it is well taken. But beyond the numbers a host of policy issues require urgent attention if the ambitious expectations of growth of different sectors of the economy and of employment are to fructify. To mention one in regard to which very little has been done so far because it is a politically sensitive subject, major changes are imperative in labour laws and regulations to impart a measure of flexibility to the labour market and make possible the organisational restructuring so very necessary in the public sector as much as in the private sector to achieve growth of investment, production and productivity of the required order. The Planning Strategy chapter of the Plan itself mentions a number of other areas where policy action is equally called for. For instance, acknowledging globalisation as a reality "which cannot be denied and also should not be avoided", it is emphasised that globalisation "needs to be managed so that we can derive the maximum advantage from world markets". However, it will hardly be disputed that the Planning Commission has had little or no contribution to make to policy formulation in these and the many other areas which have been the subjects of discussion and policy changes in the nineties.

What is especially sad is that no one is in the least surprised that this should have been so or expects anything different from the Planning Commission. The reason of course is that it is taken for granted that everything about the Commission – its entire orientation and history, its gargantuan size and structure – renders it unfit for anything other than the production of 1,313 page tomes once every five years or so, the once a year routine of haggling with the finance ministry over the size of budgetary support to the annual plan, the leisurely and largely vacuous exchanges with the states over their annual plans and the meaningless charade of 'approving' Plan programmes and projects, big, small and minute. Certainly, as it is today the Planning Commission is just not cut out for 'planning for policy' which, according to the authors of the Ninth Plan's Development Strategy, is what the planning process should focus on. To change this should be at the top of the agenda of the Commission's new deputy chairman. Will he bite the bullet or, like his innumerable predecessors, opt for a life of peace and quiet?

BIHAR

Opportunist Politics

ALTHOUGH it may be debatable whether or not the Rashtriya Janata Dal (RJD) government in Bihar should have been ousted through the imposition of president's rule, no one can deny that it had lost the moral right to rule the state long ago, what with the fodder scam involving its supremo and the connivance of its administration in atrocities on the dalit poor.

In such circumstances, the tears shed over its ouster by some Left leaders betray an utterly cynical lack of concern for the suffering of the people of Bihar and sheer opportunist tactics of harbouring a corrupt politician like Laloo Yadav for the sake of building a Third Front in the fight against the BJP and its allies. While advising Yadav to move the courts against the imposition of president's rule, Jyoti Basu is reported to have said that "killings take place everywhere", suggesting that since they have become the order of the day they do not warrant the ouster of any state government for failing to stop such killings. That Basu's views have very few takers was evident from the scanty public participation in the processions brought out by his party in Calcutta to protest against the dismissal of the Rabri Devi government. In Laloo Yadav's own state, for all his usual bravado, he could not muster much public support, as very few people gathered to watch his theatrical ritual of courting arrest in Patna.

It is obvious that Laloo Yadav's popularity had been ebbing for quite some time. The solidarity that the non-BJP parties (including the Congress) demonstrated last September in protest against the BJP-led central government's recommendation of president's rule was totally missing this time. The Congress, which was supporting the Rabri Devi government till the end, has been distancing itself from it during the last few weeks. The two massacres – at Shankarbigha and Narayanpur, one coming on the heels of the other – were a further blow to Laloo Yadav's image. It was this moment of his growing isolation that provided the BJP-led government at the centre the chance to pounce upon him and impose president's rule. It also helped the BJP to pacify its disgruntled ally, the Samata Party, which had been demanding the ouster of Rabri Devi's government from the beginning.

Thus the BJP, besieged from all corners, has now found a reprieve. By sending the army and paramilitary forces to Bihar the centre is trying to impress the people in Bihar that it is determined to curb the Ranvir Sena and restore law and order in the state. The army and the central forces are however likely to be directed more against Laloo Yadav's followers in the immediate future, if they try to demonstrate and disrupt public order. Once they are taken care of, one would like to see how president's rule leads to the punishment of the upper caste landlords' private goons who are guilty of the massacres. Or will the security forces be deployed against the naxalite enclaves in the state to suppress the militant protests of the rural poor?

While this possibility following president's rule in Bihar cannot be ignored, the Left parties should at the same time beware of turning Laloo Yadav into a martyr. Of late, his ally Mulayam Singh Yadav of the Samajwadi Party has been negotiating with the Left parties to accept Laloo Yadav as a partner in the anti-communal Third Front. The Left leaders have agreed to invite him to the national convention for the formation of an anti-BJP platform in Delhi. After his ouster now in the eyes of these leaders his value may have gone up further (as is evident from Jyoti Basu's observations) and he may be considered a fit ally who deserves all-out support.

But such a step will prove suicidal for the Left and other democratic and secular forces. By allying with a corrupt politician who has also proved his administrative ineptitude, the Left will taint its own image. In fact, instead of giving the BJP a chance to pose as a champion of the dalits and a fighter against corruption, the Left should have had the courage and honesty long ago to lead the agitation against Laloo Yadav. At the state level, since 1990 when he came to power, the CPI and the CPI(M-L) have been at the receiving end of Laloo Yadav's politics of caste-based populism, with the help of which the wily leader has wooed away large chunks of the followers of these parties and brought about a fragmentation among the rural poor in their struggle against the feudal landlords. While the CPI and the CPI(M-L) therefore have been quite understandably opposed to Laloo's entry into the Third Front, the CPI(M) which does not have any base in Bihar and therefore faces no resistance from Laloo Yadav can afford to ignore the plight of the other Left parties. It is no wonder therefore that the CPI(M) at the national level is willing to accommodate Laloo Yadav.

The argument offered by the Left leaders, and the CPI(M) in particular, in defence of including Laloo Yadav in the Third Front is that, even if he is corrupt, he is anti-communal and committed to fighting the BJP But then, while one agrees with giving priority to defeating communal forces, should one trade off the anti-corruption agenda against the anti-communal agenda? Instead of picking up just about any stick to beat the BJP, should not the Left be discerning in its choice of allies? After all, as a stick Laloo Yadav is not all that firm and straight, and will remain an embarrassing liability in any Third Front as along as the fodder scam case continues. By defending and accommodating such a politician, the Left and other secular parties will be liable to be blamed of acquiescence in his corrupt deeds and abetting in his rule which has wrought havoc in Bihar.

MAHARASHTRA

Literary Contretemps

A correspondent writes:

MANY debates have crystallised around the Akhil Bharatiya Marathi Sahitya Sammelan (All-India Marathi Literary Conference) during its 122-year history. The only organisation of its kind among the Indian languages, the sammelan has had little tangible to offer writers as it lacks any executive power. It has remained in the limelight as a platform for voicing the position of the Marathi literary community on cultural and political issues Though Marathi litterateurs have occasionally in the past mobilised this platform or floated temporary alternative ones to put up a fight against particularly blatant instances of political interference in cultural matters, the consistently large financial support extended by successive governments in Maharashtra has transformed the sammelan over the years into a lavish social gathering on the one hand and enabled it to claim to represent the literary mainstream on the other.

It is the hollowness of this claim that was sought to be exposed by the 'vidrohi' sahitya sammelan organised parallelly to the 72nd official literary conference in Mumbai this year. It was, however, Shiv Sena chief Bal Thackeray's characterisation of the official sammelan as a 'bail bazaar' (cattle-show) which upset the literary establishment and propelled the latter into an overt confrontation with the government.

With the coming to power of the Shiv Sena-BJP government, it was natural for Thackeray to fancy that the cultural community, along with the rest, would accept his style of functioning and his supremacy without demur. In this context, the criticism by the noted Marathi litterateur P L Deshpande a couple of years ago of the strong arm tactics of the party in power and by the president of the latest sammelan, though muted, in his presidential address of forces stifling freedom of expression were bound to raise the hackles of the Shiv Sena chief who was expecting the sammelan to be grateful for his government's largesse.

The attitude of Marathi writers towards government patronage has always been marked by contradictions. Among those who boycotted the official sammelan as

a protest against the government's inaction over attacks on journalists, artists and works of art, there were many who have accepted prizes, grants and housing from the present government. Many eminent men of letters, who had opposed the emergency or political interference during A R Antulay's Congress rule in the state, had had no hesitation when Sharad Pawar disbursed three and a half crore rupees during his tenure as chief minister in the late 1980s. Thus the Marathi literary community as a whole has never been able to uncompromisingly distance itself from those in power. Thackeray's reminders about the huge amount drawn from the state's exchequer to organise the grand literary function brought out the pathetic dependence of various literary bodies on state funding.

The 'vidrohi' sahitya sammelan, which drew more response than was expected, interrogated the legitimacy of the official conference from a different standpoint. Instead of opposing the official conference for allowing politicians of a particular hue on the dais, the vidrohis, claiming to take inspiration from Jotirao Phule's exhortation that the toiling masses should form their own literary organisations, pointed out that the official platform operating within brahmanical parameters had deliberately denied recognition to writers of the lower castes throughout its history. In a sense, the vidrohis were reflecting the shift that has taken place in the social base of literary production with the lower castes now in the forefront of literary innovation in style and content. Given that till now almost all the presidents of the all-India conference have been brahmins and have been elected by less than 300 persons in charge of different literary bodies spread across the state, it is clearly misleading to attribute to the conference a representative status. Nevertheless, the challenge before the vidrohis remains that of drawing writers of the constituency they seek to represent on their platform. This involves gaining prestige and status for the 'vidrohi' platform which at present it clearly lacks, as was evident from the minuscule presence of creative writers at the 'vidrohi' sammelan.

Moreover, some of these writers have in the past not hesitated to contest the presidential elections of the all-India conference, thus compounding the problems for the vidrohis. More importantly, Thackeray's fulminations notwithstanding, the recognition granted by successive governments to the all-India conference cannot be overlooked. It will be binding on litterateurs approving of the stand taken by the vidrohis to not only dissociate themselves from the official platform but also free themselves from the government's apron-strings, something which the writers, given their track-record, will find difficult to sustain. On the other hand, having made their political statement, the vidrohis will quickly run out of steam if they do not devise innovative means of promoting their literary culture which remains central to large numbers of the population making the transition from illiteracy to literacy. This will be the audience and readership that the vidrohis need to address if they want to meet the challenge they have set for themselves.

MEDICAL EDUCATION

Too Many Cooks

THE eight grace marks awarded to MBBS examinees of the Mumbai University appears to have opened a can of worms that had been kept tightly closed for decades. For, under acrimonious discussion are not merely issues of whether such a grant of grace marks was justified but the relative roles and responsibilities of the university and the Medical Council. What has arisen in Mumbai is a piquant situation: while the Maharashtra Medical Council is responsible for the quality of education in medical colleges in the state, it cannot apparently interfere with the method by which students are evaluated and eventually allowed to apply to the MMC for the grant of licences to practise medicine. Even more importantly, the issue puts a rhetorical question mark on the kind of doctors that Indian medical colleges are producing.

The issue was simple enough: several students who had done well in other subjects had failed in the paper on preventive and social medicine, a subject most medical students routinely neglect and have little use for in their future lucrative careers. Given this, it was unacceptable that the careers of students who did so brilliantly should be damaged merely because they could not clear a PSM paper. A petition was duly launched seeking grace marks, on the ground that the question paper was unusually 'tough'. Following this the university granted eight grace marks to all the students who had failed. All would have been well if a curious journalist had not sought the 'tough' question paper. It contained such assignments as short notes on 'Alcoholics Anonymous', 'efficacy of BCG vaccine', 'activities of UNICEF', 'urban malaria programme', 'social factors in STDs', 'directly observed therapy in tuberculosis', 'Child Relief and You', 'control of rheumatic heart disease'. A much disturbed Maharashtra Medical Council took it upon itself to constitute an investigation into the case, breaking wide open delicate and difficult issues of the relative jurisdiction of the university and the council. It would be easy enough to decry the medical student who found it difficult to write a short note on BCG vaccine or the activities of the organisation named CRY. However, the students' ignorance is only a reflection of the inadequate grounding of medical education in the country in current ground realities, in the social dimensions of disease and the role of preventive public health care. There have been numerous committees and even a draft medical education policy suggesting long overdue changes which have never seen the light of day.

Similarly the other issue of the who is in charge of medical education has also been buried under for a long time. The graduate medical degree is awarded by the university and the medical colleges are under its jurisdiction. However, no medical college may function without being duly recognised by the state medical council. The council has set up guidelines and minimum requirements, such as the kind of hospital which should be attached to a medical college, the qualification of teachers, the equipment and other services, including cadavers available to the students, etc. In essential aspects the purview of the Medical Council has not changed much since the time the Medical Council of India came into being long before independence. Its main purpose then was to ensure minimum standards for medical graduates in India while shifting the burden from the British Medical Council of having to deal with the 'brown' doctors.

The council played a low key role for as long as medical colleges were mostly state-run and their numbers were small. By the late 1980s the burgeoning of private medical colleges and hospitals resulted inevitably in exposing the complete powerlessness of the council to implement requisite standards and monitor them, leading to a move to review the Medical Council Act and give it more teeth. In recent years, several factors have forced the state councils to clean up their act. It is not surprising that the MMC has taken upon itself the task of enquiring into the 'grace marks' issue. While there are, according to the MMC, few precedents to this case, it is fully within its jurisdiction to set up such a committee. However, it is not clear if the council has the right to 'interfere' with the conduct of the examination by the university. The issue has been further complicated by the fact that only recently Maharashtra has passed a bill setting up a health university in Nashik to which all medical colleges will be attached and which presumably will be the authority that will conduct examinations. With the none too heartening experience of health universities in Tamil Nadu, medical education in Maharashtra, it would seem, will have to suffer one cook too many.

CURRENT STATISTICS

***EPW* Research Foundation**

The revised national income series with the base 1993-94=100 makes an upward revision of GDP by about 10 to 12 per cent following the inclusion of new items/improvements effected in 17 sectors. As the bulk of the new items are of a consumption nature, higher revisions have been made in private final consumption expenditure in the domestic market. The revision has made only a fractional difference to the annual growth in real GDP, but the domestic saving ratio has fallen sharply from 26 per cent to 24/23 per cent While the capital inflow figures now used are higher, the capital formation rate which ranged from 25.4 to 25 8 per cent during 1994-95 to 1996-97 has declined to 24 8 per cent in 1997-98

SUPREME INDUSTRIES

Successful Restructuring

CONTROLLED by the Taparias, Supreme Industries is engaged in the manufacture of injection moulded plastic products, extruded products and machinery and moulds. It also trades in polymers, yarn and colourants. The company performed well in 1997-98, when its net sales increased by 14.8 per cent over the pervious year. While operating profit improved by 7.4 per cent, a fall in interest charges helped the company post a 30.2 per cent increase in its bottomline. Though earnings per share increased from Rs 11.9 to Rs 14.6, the company did not raise the dividend rate but maintained it at last year's level of 60 per cent. Book value, meanwhile, moved up from Rs 117.2 per share to Rs 125.2 per share. The company's stock currently quotes at around Rs 185 on the bourses, discounting its 1997-98 earnings by 12.7 times.

The company claims that its encouraging performance is mainly due to the successful restructuring exercise carried out over the last couple of years. The effects of the recast are evident in the increase in volumes. Polymers processed during the year increased by about 29 per cent to 59,945 metric tonnes. Apart from the fruits of restructuring, the weakening of global prices of polymer, which is the company's main raw material, has also benefited Supreme Industries. Unlike earlier, the company is now sourcing a large part of its requirements locally, and consequently the depreciation in the rupee has not affected it much. The company has been constantly focusing on reducing the import content of its raw material consumption This is evident from the fact that as compared to 45 per cent of imported raw material used in 1995-96, the percentage came down to 27 per cent in the following year and is now down to 10 per cent in the year under review.

The company's project for production of material handling crates at Pondicherry (Unit I) and Talegaon has been consolidated and higher capacity has been made available as a result. The company has also commissioned a fabricated fittings division, which will help it to expand the range on offer. Supreme Industries has also commissioned additional capacity in its protective packaging business, in addition to acquiring a unit in the west, thus gaining an advantage by reducing freight costs. Three of the company's flexible packaging divisions have been shifted to Khopoli in order to save on production costs.

As its multi-layered sheets business was not profitable, the company has diverted it to making thermoformed food serviceware products which are used by producers of soft drinks, dairy products and food products.

Meanwhile, the promoters of the company, the Taparias, have divested a part of their holdings in Supreme Industries in the open market to pay off unsecured loans which were contracted at the time of the rights issue to subscribe to their share of the rights in June 1993. After the divestment, the promoters' holding has declined from 43.1 per cent to 39.06 per cent in the company's enlarged capital of Rs 9.76 crore.

UNITED BREWERIES

Success in Malt Research

The flagship company of the Vijay Mallya group of companies, United Breweries (UB) put up a lacklustre performance in 1997-98. While net sales declined by 2.8 per cent over the previous year, operating profit crashed by 24 per cent. But a sharp increase in non-operating profit, mainly on account of profit on sale of investments, helped the company to almost double its bottomline. Though the company's earnings per share increased from Rs 2.85 to Rs 5.68, it prudently decided against raising the dividend rate and maintained it at last year's level of 20 per cent. Book value, meanwhile, edged up from Rs 160.7 per share to Rs 163.9 per share. The company's equity share is quoted at around Rs 22 on the bourses, discounting its 1997-98 earnings per share by a mere 3.9 times, reflecting the low market assessment of the stock.

Despite its poor show on the profitability front, UB, which is famous for its Kingfisher brand of beer, continues to dominate the mild beer segment in the country, increasing its market share by 2

per cent despite the overall drop of 2 per cent in the segment as a whole.

UB claims to have achieved a breakthrough in malt research with the evolution of the Vijay M 130, a strain that can be grown across Indian plains. While the Indian Council of Agricultural Research's various wheat and barley research centres, especially the one at Karnal, are experimenting with a host of new barley strains, UB's Vijay M 130 has reportedly taken the lead and has been released for commercial growing. The new strain of barley is claimed to be higher yielding, to have a greater starch content and be capable of being grown in the south where barley has never been grown. The company is considering patenting the variety.

Meanwhile the battle between liquor majors Kishore Chhabria and Vijay Mallya for the controlling stake in Herbertsons continued with the latter accusing the former of violating SEBI's take-over code while acquiring the company's shares from the open market. However, the Chhabria camp has taken refuge in the fact that when the acquisition was made in 1993, the then take-over code did not address a situation wherein an acquisition of an unlisted company, which holds shares of a listed company, triggers the code. The new take-over code which came into effect from February 1997 has plugged this loophole.

VIDEOCON APPLIANCES

Rise in Sales

Videocon Appliances, a Dhoot group company, is engaged in marketing air conditioners, refrigerators, programmable washing machines, microwave ovens, assemblies and sub-assemblies. The company fared well in 1997-98 when its net sales increased by 14.1 per cent over 1996-97. Operating profit surged by 37.9 per cent. A somewhat lower increase in interest charges helped the company post a 72.4 per cent higher net profit over the same period. However, though earnings per share improved from Rs 5.7 to Rs 8.4, the company decided to maintain the dividend at 10 per cent.

Due to the conversion of non-tradable warrants issued earlier, the company's equity capital increased from Rs 28.1 crore to Rs 33.1 crore. Book value, meanwhile, fell from Rs 81.6 per share to Rs 72.1 per share, mainly on account of the increase in equity. The company's equity share is presently traded at around Rs 18.5, discounting its 1997-98 earnings per share by a mere 2.2 times, reflecting the poor discounting enjoyed by trading companies.

Misplaced Focus on Fiscal Deficit

One of the disconcerting aspects of fiscal management since the beginning of the stabilisation programme in 1991-92 has been the failure to focus on correcting the growing revenue deficit of the central government. The focus instead has been on reducing gross fiscal deficit without taking into account the structure of financing of this deficit.

I
Fiscal Crisis

THAT the government of India would face a fiscal crisis during the current year was widely anticipated, but the persistent sluggishness in industrial activity and the consequential slow-down in revenue receipts have made the crisis a deep and unprecedented one. One of the disconcerting aspects of fiscal management right from the beginning of the stabilisation programme in 1991-92 has been the failure to focus on correcting the growing revenue deficit of the central government; the focus instead has been on reducing gross fiscal deficit without taking into account the structure of financing this deficit – a clear case of distorted priorities. A concerted focus on narrowing the revenue deficit also had the potential of generating a virtuous circle leading to arresting of the growth of fiscal deficit. In that framework, it is not the size of the gross fiscal deficit that should be worrying; what matters are the purposes for which it is spent (plan and capital expenditures as distinguished from revenue expenditures) and the sources of financing it (small savings, PF, etc, as against sizeable market borrowings).

The monthly data released for the first time by the Controller General of Accounts (CGA) under the IMF's special data dissemination standards (SDDS) for the current year are an eye-opener. The data available are up to the end of December and the bulge in budgetary operations in the fiscal year's last quarter may alter the overall scene somewhat; even so, the essential features of the fiscal trends this year as revealed so far are unlikely to be reversed. A glaring revelation is the massive size of market borrowing to finance the growing non-plan expenditure and, in turn, the galloping of the revenue deficit. During April-December 1997 the revenue deficit had reached only 44 per cent of the budgeted amount; this year during the same nine-month period it has touched 75.7 per cent suggesting that the revenue deficit may finally cross the budgeted amount of Rs 48,068 crore (3 per cent of GDP) by at least one-third, that is, up to 4 per cent of GDP. A major cause for this has been the slackness in revenue receipts, both tax and non-tax, and a persistent decline in the tax to GDP ratio.

In consequence, plan expenditures as well as capital expenditures have seen niggardly growth. Even so, the government's market borrowings have skyrocketed. The centre's net borrowings have reached Rs 60,723 crore, i e, Rs 12,397 crore more than the budgeted amount for the whole year (Rs 48,326 crore). Such large borrowings have been made possible, without any serious repercussions on the prevailing interest rate structure, because of unprecedentedly large contribution from the RBI and that too through the private placement route. The government also appears to have repeatedly used the the RBI's ways and means limit of Rs 7,000 crore.

As for the sources of financing the fiscal deficit, as in the past two years, this year too the collections of small savings, public provident funds, and state provident funds, have been extremely buoyant (about 75-80 per cent of which are given to states an loans and advances). Such collections, which constitute a form of direct savings of the community, are to be welcomed and promoted. This compositional aspect of the fiscal deficit has hardly received the attention it deserves. If GFD touches 6.5 per cent of GDP as it is predicted to in the current year (against the budget estimate of 5.4 per cent), market borrowings would contribute less than 4 per cent of GDP, with the balance coming from small savings, provident funds, etc

II
Call and Forex Markets

The call money rates were largely range-bound around 9 per cent but firm during the month except for a brief aberration during January 14-16 when the rates shot up to as high as 25-35 per cent (Graph A). After opening low at 6.50-6.75 per cent on the New Year day which was a reporting Friday, the call rates faced firmness during

the first fortnight due to drying up of liquidity following the RBI's heavy open market operations (over Rs 2,500 crore as per SGL data), outflows due to 364-day treasury bills auctions (Rs 750 crore), and absence of the expected return flow from the earlier tax outflows, as also bank strike (January 12) and holidays in many parts of the country. Many banks did not anticipate the possible disruptions to liquidity management from these events and found themselves scrambling for funds for last minute CRR covering; the panic drew banks to borrow at 25 per cent on January 14 and even at 35 per cent on January 15, the latter being unusual for a reporting Friday (Tables 1 and 2). Most primary dealers availed of the RBI refinance including the special liquidity support announced in April 1998 against the collateral of government securities. As a result, the RBI lendings to "others" shot up from Rs 4,269 crore on January 1 to Rs 8,492 crore on January 15.

The liquidity, however, returned to the system in the second fortnight with an inflow of Rs 3,000 on January 18, due to the maturity of the zero coupon 1999 paper which was the first of its kind to be issued in 1994. For facilitating redemption, the government made on the same day two private placements worth Rs 3,000 with the RBI, which boosted the market sentiment and eased the call rates as such borrowing did not impinge immediately on the market liquidity. The liquidity continued to remain comfortable during the fortnight as there were fresh inflows of about Rs 1,340 crore from interest payments on dated securities and redemption of TBs (Table 3). The last few days of the month saw the call rates ruling lower at a little over 8 per cent and on the last reporting Friday (January 29) they dipped to a range of 6.50 to 8 per cent – a market sentiment which was also influenced by a huge Rs 5,000 private placement again by the government with the RBI on that day.

The foreign exchange market remained extremely calm and the rupee rate experienced a slight application just below Rs 42.50 per US dollar during the month (Graph B). Even in trade-weighted terms the rupee remained stable *vis-a-vis* five major currencies (RBI monthly *Bulletin* for February 1999). The stability in the spot market was also reflected in the forward market with the six-month premia declining from about 7.50 per cent per annum in the previous month and remaining in the range of 6.40 to 6.70 per cent (Graph C). The FIIs were net buyers on Indian markets to the tune of $ 106.6 million during January, and another $ 9.9 million up to February 12. As such, despite slow-down on the FDI front, and despite widening conventional merchandise deficit, the foreign currency flow has remained positive, which has resulted in an increase in the foreign currency assets of the RBI by US $ 575 million between end-December and February 5. The authorised dealers' excess spot purchases over spot sales under the merchant transactions during January reflected this positive flow.

The rise has been US $ 1.5 billion (excluding RIB proceeds) since mid-September 1998, that is, some period after the RBI measures to calm the foreign exchange market were announced in August.

III
Primary Markets

Dated Securities

After breaching the whole year's target set for its market borrowing programme in December, the central government continued to borrow relentlessly even in January as its ways and means advances from the RBI have exceeded the limit of Rs 7,000 crore set for the second half of the fiscal year. However, in order not to destabilise the interest rates, the RBI continued to take private placements of the government paper and also used the opportunity given by this route to alter the maturity profile of new floatations by issuing long-dated securities. As against three issues worth Rs 10,000 crore for 10-year maturity during 1997-98, the current year has seen as much as 14 issues for a total amount of Rs 31,209 crore or 37 per cent of the total for maturities of 10 years or over (Table 4). Likewise, private placements have dominated the issues during the current year.

In January, the papers privately placed comprised first the reissue of two earlier securities of 15- and 18-year maturities The reason for this private placement on January 18 was to meet the redemption pressure arising of the zero coupon bond maturity on the same day. The reissued papers were 12.40 per cent 2013 and 12.60 per cent 2016 for Rs 1,500 crore each which were issued earlier on tap on August 20 and November 23, respectively. Again, on January 29, the government privately placed two securities totalling Rs 5,000 crore with the RBI; this comprised two new securities – one of 11-year tenure maturing 2010 with 12.29 per cent coupon for Rs 3,000 crore and the other of 12-year tenure (2011) with a coupon of 12.32 per cent for Rs 2,000 crore.

Figures in parentheses in cols 3 to 6 represent numbers and amounts of non-competitive bids which are not included in the total.
Figures in the square brackets under cols 8 and 9 represent weighted average price and respective yield.
* Bracketed figures in col 7, if any, relate to devolvement on primary dealers, exclusive of RBI. – No bid

Meanwhile, on January 13, Punjab raised Rs 60 crore through a 10-year paper by directly auctioning it in the market, the first of its kind amongst the states. This follows the RBI's decision to permit states to have limited 5 to 35 per cent of their market borrowings as independent access. The issue received overwhelming response. For a notified amount of Rs 60 crore, it received 29 bids for an amount of Rs 195 crore. The cut-off rate cleared by the market on this paper at the notified amount was 12.47 per cent, 3 basis points lower than the fixed rate of 12.50 per cent offered during the current fiscal by the RBI on the states' paper. The weighted average rate of the cost of borrowing funds for Punjab, however, was lower at 12.39 per cent.

Treasury Bills

The market response to TBs of varying maturities was uneven. While the market favoured the 364-day bills, the response to 14- and 91-day bills was poor. As a result, the RBI reduced the weekly notified amount for the 91-day TBs to a meagre Rs 100 crore from Rs 400 crore earlier (Tables 5 and 6) The amount was so low that doubts have arisen as to whether its yield would continue to serve as a benchmark rate in the market. 364-day bills, on the other hand, were quite popular with a large number of bids: 33 for Rs 1,834 crore and 57 for Rs 2,008 crore were received in the two auctions conducted during the month for a notified amount of Rs 750 crore each. Nevertheless, the RBI was able to maintain the cutoff yields on all the three TBs generally at the previous month's levels.

Bonds Market

Bond issues of banks were dominant in January; these were with a view to mobilising parts of their tier-II capital. In all, seven banks entered the market proposing to collectively raise about Rs 2,245 crore. Almost all the issues met with the targeted amount on the first day itself and closed soon thereafter. The rate of interest ranged between 13.85 per cent and 14.5 per cent for maturities varying between 62 months and 87 months.

The ICICI was also in the market with Safety Bonds Series VI to collect Rs 300 crore with an option to retain over-subscription of an equal amount. The multi-option bonds issue introduced a new instrument, viz. easy instalment bond. In fact, this is a variant of a regular return bond wherein an investor can pay face value of Rs 10,000 in four instalments: Rs 2,500 on application and Rs 2,500 after three, six and nine months, respectively, such that the first year carries a coupon rate of 8 per cent. Subsequently, the rate would be 15 per cent from the second to fifth year. The YTM amounts to 13.8 per cent. The other options of the issue more or less remain the same.

The ICICI was also in the private placement segment of the debt market with 61-month preference shares. The amount it proposed to raise is not known. It is offering a 10 per cent tax-free dividend payable annually. The issue is mainly targeting the retail investors which seems to have been prompted by the reduction effected by the RBI in the tax-free interest rates generally from 10 per cent to 9 per cent payable half yearly; ICICI's relief bonds fall into this category. The IFCI's 5-year and 7-year bonds in the private placement segment carrying coupon rates

of 14 per cent and 14.25 per cent, respectively, have been over-subscribed with collection exceeding Rs 550 crore as against the proposed amount of Rs 200 crore; it had an option to retain the over-subscription. Amongst the FIs, IDBI was not in the market in January but proposes to come soon with retirement bonds with a coupon rate of 13.79 per cent for 9 years and 14.05 per cent for 10 years.

Among the NBFCs, GE Capital Services, First Leasing Company and Cholamandalam Investment and Finance Company were in the market. In an interesting move, the finance ministry has cautioned the financial institutions against subscribing to the paper floated by the GE Caps on the assurance of a comfort letter from its parent company. The ministry press release said: "FIs have been informed that this is not legally enforceable. After that, it is for them to decide". But, the FIs felt that the GE, USA, had a turnover much larger than the union budget and its comfort letter gave GE Caps India a good rating.

Among the public sector undertakings, most of the issues continued from the previous month. The Power Finance Corporation (PFC) has collected Rs 200 crore against the targeted sum of Rs 100 crore (plus over-subscription, if any) on its privately placed 10-year bond offering 13.85 per cent rate of interest. The issue is expected to announce the closure soon. Kerala State Electricity Board (KSEB) entered the market with a 10-year guaranteed paper offering a higher coupon rate of 15.25 per cent. This issue which offered an upfront incentive of 0.25 per cent has met with the targeted amount of Rs 200 crore. The other issues were from Andhra Pradesh State Electricity Board (APSEB), Tourism Finance Corporation of India (TFCI), UP Co-op Spinning Mills Federation (UPCSMF) and Punjab Urban Development Authority (PUDA) with maturities varying between 5 years and 7 years offering coupon rates of 14 per cent to 16 per cent. UPCSMF offered the highest rate of 16 per cent, whereas 14 per cent was offered by TFCI and PUDA. Amongst the manufacturing PSUs, Bharat Heavy Plates and Vessels entered the market with 3-year unsecured bond to raise Rs 50 crore issue at a yield of 14 per cent. Besides, the Gujarat State Fertilisers Corp (GSFC) successfully met with the targeted amount of Rs 33 crore on its 3-year preference shares at a coupon rate of 10.75 per cent. Meanwhile, the finance ministry was reported to have given approval to 13 public sector undertakings to raise funds for infrastructure development through bonds and other instruments.

In the private corporate sector, Deepak Fertilisers and the Tata Industries entered the market to raise about Rs 150 crore together. Deepak Fertilisers and Tata Industries were in the private placement segment with non-convertible debentures (NCD) with yields working out to be 14.76 per cent and 15.10 per cent, respectively. Interestingly, Noida Toll Bridge Company was in the market for raising Rs 50 crore each through a fully convertible debenture and a 16-year deep discount bond. The bonds have a take-out facility with IL and FS and the IDFC. They offered an attractive 13.70 per cent and 14.19 per cent yield to maturity return, respectively, in addition to tax benefits. The issue was privately placed with banks and FIs.

Securitisation

Reliance Industries securitised its receivables of the Panna-Mukta-Tapti oilfields at Rs 1,200 crore for 15 years with ICICI. ICICI has done this through a special purpose vehicle placed with a few banks, including SBI by way of a paper bearing coupon rate of 15 per cent. This is the second securitisation deal in oil for ICICI. ICICI also securitised the visa card receivables of a Chennai-based consumer durables retail chain called Vivek's Ltd for the next five years. In this novel deal, ICICI has lent Rs 5 crore to Vivek's Ltd, against its projections of visa card sales in the next five years. The deal bears 15.5 per cent interest and is repayable over five years. Citibank which is the collecting bank for Vivek's credit card bills, will through an escrow account channelise ICICI's dues from Vivek's visa card sales. Incidentally, given the expertise of ICICI in securitisation deals, the RBI has asked it to prepare a paper on how to give impetus to securitisation.

(-) means no trading YTM = Yield to maturity in percentage per annum CY = Current yield in per cent per annum * Yield rates of these sub-groups of t-bills and dated securities have been used for the graphs. Securities with small-size transactions and inflation linked bonds have been dropped from the above list but included in the respective totals

Notes: 1) Yields are weighted yields, weighted by the amounts of each transaction

2) Current yield has not been worked out for treasury bills.

Credit-Linked Notes (CLNs)

As per a report, a new product, called credit-linked notes (CLNs), had entered the Indian financial market. CLNs are a derivative product that are securities with payments linked to a credit related event, such as, default, credit rating downgrade or a structural change in a security containing credit risk. CLNs allow the lender to separate the credit risk from the market risk or the underlying asset without touching the balance sheet or the bank's relationship with a credit. The unbundling of credit risk can also be done from other aspects of ownership such as, tax, accounting and liquidity. Under this arrangement, if a lender feels overexposed to a company or a region, he can hedge the credit risk by parcelling it out to a willing buyer through a CNL. While holding the original bond, he effectively sells the credit risk to a third party who then is liable to pay up in case of default or rating downgrade, etc. It was reported that deals were already taking place for bonds of ICICI and IDBI in overseas markets. ICICI was itself keen to deal in such products for bonds of other Indian corporates.

Other Instruments

The stability in the call/notice money markets reflected on other short-term interest rates also. The discount rates on CPs were marginally lower at 9.60-13.45 per cent range on January 31 compared to the discount rates of 9.80-13.50 per cent as on December 31. The outstanding amount of CPs also declined marginally from Rs 5,474 crore on December 31 to Rs 5,261 crore on January 31. The amount of CPs issued increased to Rs 1,215 crore and Rs 1,086 crore during the fortnights ending January 15 and January 31, respectively, from Rs 786 crore as on December 31, 1998. Data on certificates of deposits were not available beyond October 23, 1998; at that stage the outstanding CDs stood at Rs 6,214 crore against a top figure of Rs 14,584 crore as of April 10, 1998.

MMMFs

The money market mutual funds also seem to be doing reasonably well. The UTI MMMF with a collection of Rs 160 crore, quoted at an NAV of Rs 11.8970 on January 12 whereas other private sector players were quoting at an NAV ranging between Rs 8.01 and Rs 9.5.

IV
Secondary Market

Gilts

The secondary market activity remained confined to short- and medium-term papers with the prices remaining flat. The brief turbulence in the call market during January 14-17 affected the security prices for a couple of days. The prices dropped by 10-15 paise but recovered almost immediately upon call rate recovery. 11.40 per cent 2000 (Rs 2,616 crore) and 11.55 per cent 2001 securities (Rs 1,766 crore) were the most traded papers, but converted securities (Rs 2,265 crore) and zero coupon bonds (Rs 1,717 crore) enjoyed steady demand. The total turnover in dated securities at Rs 13,714 crore during the five weeks ended January 31 was somewhat higher than that in four weeks of December (Rs 8,348 crore). Interest in secondary market trading for TBs was mainly in 91-day bills. Amongst the long-dated securities, the only one to show some noticeable activity was the 12.25 per cent 2008 at an average YTP of 12.22 per cent (Rs 521 crore). Though the deals were fewer in long-dated securities, the yield curve remained steeply upward sloping (Graphs D and E), which was partly the influence of the RBI's aggressive open market operations.

Repos and OMOs

As a result of a massive monetisation of government paper including through the process of private placement, the RBI has been forced to activate its OMOs. During the five weeks ending January 31, there were OMOs worth Rs 4,544 crore. So far during April-January 1998-99, the OMOs have aggregated a massive Rs 38,928 crore – an unprecedented sum – against Rs 6,864 crore during the whole of 1997-98.

The market response to fixed-rate repo auction of the RBI was lukewarm throughout the month because of the pressure of liquidity in the market and the call rates remaining higher than the repo rate of 8 per cent. On as many as 13 days in the month the repo auctions received no application (Table 8). After receiving one bid for Rs 1,500 crore on January 6 which was paid back on January 9, no application was received for the next six days and the RBI was thus left with no outstanding amount. On four auction dates the outstanding amount had dipped to zero and another seven dates, it ranged from Rs 5 crore to Rs 30 crore. There were also considerable activities in the repo market outside the RBI (Table 9).

Bonds and other instruments

The secondary market activity in commercial instruments was considerably less during the month than in earlier months (Table 10).

The Enron Report: Human Rights and Multinationals

A G Noorani

Nothing remotely comparable in research or analysis to the Human Rights Watch's report on the Enron Corporation has been published in India. The report deserves to be reprinted in an Indian edition.

THE report on the Enron Corporation produced by Human Rights Watch (*The Enron Corporation: Corporate Complicity in Human Rights Violations*, Human Rights Watch, 350 Fifth Avenue, 34th Floor, New York, NY 10118-3299, USA, pp 165) deserves wide readership for reasons more than one. To begin with, both the government of India and even some in the media delighted in impugning the credentials of Human Rights Watch (HRW) when it published reports on Punjab and Kashmir. Here is a report critical not only of a giant American corporation but also of the US government. It is by no means the first of its kind. Besides, granted the disparity in facilities of access and resources, nothing *remotely* comparable in research or analysis has been published in India. Research has not been a strong point with Indian civil libertarians, unlike the late S G Vaze of Pune, doyen of civil libertarians.

Lastly, the material which the report contains affects multinationals generally or transnational corporations (TNCs). HRW is concerned in the main with human rights violations, not with the wisdom of India's deal with Enron. The report notes that in recent years the energy industry has been embroiled in controversy because of its alleged involvement in situations of human rights violations throughout the world. "Some high-profile examples are Royal Dutch/Shell's operations in Nigeria; British Petroleum's development of the Cusiana-Cupiagua oil fields in Colombia; and alleged human rights violations that occurred during Total and Unocal's construction of the Yadana gas pipeline in Burma and Thailand".

Enron Power Development Corporation is a subsidiary of the Houston-based Enron Corporation, one of the world's largest energy companies. Its annual income in 1997 was more than $20 billion. Dabhol Power Corporation (DPC) is a subsidiary of the EDC. The report sets out the facts lucidly and with full documentation, from the development of the Dabhol Power Project (DPP), from 1992 to 1998. It describes Enron's dealings with the centre and two governments of Maharashtra, of the Congress(I) and the Shiv Sena-BJP. The report of the Cabinet Sub-Committee to review the DPP is set out in full. Set up on May 3, 1995 it was headed by Gopinath Munde, deputy chief minister, and consisted of three other ministers. It was signed by Munde, Sudhir Joshi, revenue minister, and Liladhar Dake, minister for industries: "The Sub-Committee, having examined the issues and having listed the deficiencies as above, is *unanimously* of the view that the arrangement in force is not tenable because of the infirmities pointed out above in the terms and conditions of the contract. It, therefore, recommends that Phase II of the project should be cancelled and Phase I should be repudiated." The project was suspended, only to be revived later.

It was in mid-1997 that the Maharashtra government announced that Enron would build what will be the largest plant in the world for generating electricity at a cost of around $3 billion. DPC is a joint venture of Enron, General Electric and the Bechtel Corporation. The Maharashtra government bought, in November 1998, 30 per cent share from Enron's 80 per cent, reducing it to 50 per cent.

Indian readers will be familiar with the protests that were voiced vigorously and the controversy that ensued, especially the charges of corruption. Those aspects deserve closer analysis and will, no doubt, be discussed in *EPW*. It is the aspect of civil liberties that worries one. We have taken for granted several antiquated statutory provisions which deserve a closer look and call for safeguards against their abuse. Suppression of protests was rough and at times brutal. The report fairly records that on one occasion there was stone-throwing by protesters and on another damage to a water pipeline. However, examining the state's response to opposition to the Dabhol Power Corporation, Human Rights Watch believes that "the state government of Maharashtra has engaged in a systematic pattern of suppression of freedom of expression and peaceful assembly coupled with arbitrary detentions, excessive use of force, and threats. In the 30 demonstrations directly researched by Human Rights Watch, and in others studied by Indian human rights monitors, there occurred only two minor unplanned incidents bordering on violence; the character of the opposition protests was peaceful. The police have also misused preventive detention laws to detain people for the peaceful expression of their views. The state has also tolerated the failure of the police to investigate or prosecute perpetrators of attacks on opponents of the Dabhol Power Project. The arrests violate the internationally recognised rights of freedom of expression, assembly, movement, protection against unjust arrest and detention, and they constitute police mistreatment. The failure to investigate or prosecute those who have attacked demonstrators represents negligent and biased behaviour by police." This is true to form in such cases.

The report is based on a six-week investigation in India, during January-February 1998 followed by investigations and interviews in New York and Washington DC. More than 1,200 pages of internal company and government documents were reviewed for the investigation. Appended to the report are the correspondence between Human Rights Watch and the Export-Import Bank of the US, the Maharashtra government's report of the Cabinet Sub-Committee to Review the Dabhol Power Project, selected conclusions and recommendations from the Indian government's Parliamentary Standing Committee on energy, and correspondence between the government of India and the World Bank concerning the economic viability of the Dabhol Power Project.

The report's discussion of the provisions of Section 144 of the Criminal Procedure Code and Section 37(1) of the Bombay Police Act, empowering the imposition of 'Prohibitory Orders', covers familiar ground. But, distance makes for better insight. The point is well taken that Section 37(1) is designed to prevent *violent* acts, not peaceful protest. The Supreme Court has construed Section 144 of the CPC and one wishes the report had analysed those rulings. The time has surely come for the court to lay down more effective safeguards against its abuse.

What is far more instructive to the Indian reader is Chapter V, on the legal obligation

of TNCs to respect human rights. In 1986 the UN Committee on TNCs developed a code of conduct for them. So did the NGOs who worked on the matter. The report says

> As a result of our research, Human Rights Watch believes that the Dabhol Power Corporation – and its parent companies Enron, General Electric and Bechtel – are complicit in human rights violations by the Maharashtra state government. Human Rights Watch does not take a position on the persistent and pervasive allegations of corruption that surround Enron's establishment in Maharashtra and its way of doing business there. But ... Enron's local entity, the Dabhol Power Corporation, benefited directly from an official policy of suppressing dissent through misuse of the law, harassment of anti-Enron protest leaders and prominent environmental activists, and police practices ranging from arbitrary to brutal.

It draws attention to Section 47 of the Bombay Police Act which enables "any person" to secure the services of "any additional number of police" on payment of the cost. Since 1994, between 10 and 300 Maharashtra police and state reserve police officers have been stationed at the DPC. It costs Rs 125 per day per officer. "These forces committed human rights violations in at least 30 demonstrations in 1997 that Human Rights Watch directly investigated...", the report says. It charges DPC with culpability for those wrongs in an entire chapter devoted to its "complicity" (Chapter VII).

Even more informative, because information on it is not easy to come by, is Chapter VIII on the 'Responsibility of Financing Institutions and of the government of the United States'. Its conclusion is that "In the case of the Dabhol Power Project, it seems that the government of the United States acted as a forceful advocate for open markets at the expense of human rights and the rule of law. Throughout the development and implementation of the Dabhol project, US government officials and various governmental agencies including the Department of Energy, Department of State, Department of Commerce, and Central Intelligence Agency consistently lobbied the Indian government heavily on behalf of the companies". The *New York Times* reported (February 18, 1995) that Frank Wisner, US ambassador to India, "constantly cajoled Indian officials". The report notes that "on every Ex-Im Bank transaction exceeding $ 10 million, the State Department is required to conduct a human rights impact assessment 'to determine if it may give rise to significant human rights concerns'. This review examines 'both the general status of human rights and the effect of the export on human rights'."

The report reproduces Wisner's testy response when HRW spoke to him on phone after his retirement. He was not aware of any human rights violations and "Why do you want to talk to me?". On October 28, 1997, very shortly after he left New Delhi, he was appointed to the Board of Directors of Enron Oil and Gas, a subsidiary of the Enron Corporation. He is affluent in his own right and did not need to stoop to this. If this is not covered by the US Ethics in Government Act, 1978, the statute should be amended to penalise such disgraceful conduct. India should have a similar law.

On the facts, there are two entire chapters on Ratnagiri district in which the suppression of protest is meticulously documented. The report should be printed in an Indian edition.

Outdated Rent Laws and Investment in Housing

Madhav Godbole

Anachronistic rent laws have been the biggest deterrent to investment in the housing sector and increasing the availability of housing. Since the political parties in power at the centre and in the states have been bent upon pursuing populist policies for the last 50 years, the battle to get a sensible law on the statute book has once again had to be taken to the Supreme Court.

IT is often said that in India fools construct houses and wise persons live in them as tenants. But the number of fools seems to be declining rapidly. The anachronistic rent legislation in a number of states has been the biggest deterrent to increasing investment in the housing sector in the country. The battle to get a sensible legislation on the statute book has, therefore, once again been taken to the Supreme Court since the political parties in power at the centre and the states have been bent on pursuing populist policies of protecting only the interests of tenants during the five decades since independence.

In its earlier order in December 1997, the Supreme Court had directed the government of Maharashtra to replace the Bombay Rent Act which had frozen rent levels at unbelievable 1940 levels with a new law that allowed reasonable increases in rent. The court had suggested that the new law be structured on the lines of the model bill on rent control circulated by the central government to the states as far back as in 1992. But, brazenly, the state government brought in an interim legislation to give a token increase in rent of just 5 per cent from April 1, 1998, making a mockery of the directive given by the highest court in the land. This amended Act is due to expire on March 31, 1999.

The low priority given to the question of revision of the Rent Act by the state government and the state legislature is evident from the fact that the bill on the subject, introduced by the then Congress government, has been before the joint select committee of the legislature since 1993. The composition of the select committee has undergone several changes since then due to the fresh elections held to the lower and upper houses of the legislature, but the bill has continued to languish and can easily qualify for mention in the Guinness Book of Records! Now, once again, there is a scramble among political parties to show their concern for tenants. The Maharashtra minister of state for housing has declared that the state government is entirely in favour of the demands of the tenants and all action will be taken by the state to foil the attempts of landlords to exploit tenants. Obviously, the need to permit reasonable returns on investment in housing as compared with returns on other competing investment opportunities is not considered as of any relevance in this discussion. It is treated as a mere battle between the rich and the poor, the haves and have-nots!

Outmoded Rent Control

It may be worth recalling the background of the rent control legislation in India as brought out by the National Commission on Urbanisation (NCU) (Interim Report, January 1987, pp 26-27). The beginning of the second world war brought a dual pressure to bear on the urban housing stock in India. The demands of the military increased the pressure on existing housing and wartime austerity and shortages prevented a sympathetic increase in supply. Purely as a temporary measure, therefore, the government introduced laws relating to the control of rent and accommodation. In their original form, these laws brought all urban properties within the purview of a rent controller who could both allot vacant premises and fix the fair rent thereof. Gradually these laws have become permanent and their focus has shifted away from allotment of vacant premises by a public authority to a freezing of rent at existing levels and the protection of the tenancy rights of the occupants. Broadly speaking, with state variations, the Rent Acts have the following provisions:

(i) control of letting and leasing of vacant buildings,
(ii) fixation of fair or standard rent,
(iii) protection of tenants from arbitrary eviction,
(iv) the obligation of owners regarding upkeep and maintenance,
(v) the rights of owners in case of misuse, non-payment of rent, etc, and
(vi) the procedure whereby owners can regain possession of premises.

The outmoded rent legislation has an adverse impact not only on investment in new housing stock but also on the maintenance, upkeep, upgradation and extension of the old stock. As emphasised by NCU, the foremost and most visible effect of the Rent Acts has been the almost universal deterioration in the condition of old buildings throughout our cities. Because rents are frozen, the owners increasingly find it difficult to keep the buildings in a state of good repair. The situation became so critical in Mumbai, for example, that the state government was forced to constitute a housing repair and reconstruction board, charge a building repair cess from every assessee of property tax and entrust the board with the task of repairing old buildings. The activities of the board have never achieved a scale where any meaningful dent could be made on the problem of deterioration of the housing stock. Stated very plainly, whilst the Rent Acts have protected the tenants in terms of the amount that they have to pay and security of tenancy, they have directly contributed to their insecurity in terms of the quality of the building in which they reside. The fact that the entire walled city of Delhi has been notified as a slum under section 3 of the Slum Area (Improvement and Removal) Act is evidence of the state to which totally controlled rents and absolute security of tenure have reduced the core of our cities.

The outmoded rent legislation has led to adoption of populist measures by the government of Maharashtra for the development and reconstruction of the cessed buildings in Mumbai. By the notification issued in January 1999, the floor space index applicable to these buildings has been relaxed beyond all reasonable limits. This decision will have serious long-term adverse implications for Mumbai and has rightly come in for widespread criticism from several quarters.

Another effect of the Rent Control Act brought out by the NCU is a very substantial reduction in residential construction for rent. All new residential development is invariably for sale, so much so that even state housing boards no longer construct any rental housing. There is also evidence of houses being kept out of the rental market even where the owner does not himself occupy the property. It is the perception of most house owners that once the house is given on rent, it will never be available to the owner. There is the emergence of the parallel economy in which there are lump sum advance payments of rent

partial payment of rent without receipts, etc. The rental market is thus highly distorted.

Most city core areas have land under extremely inefficient use. The Rent Acts are a direct contributory factor to this, because the protection extended to tenants virtually debars the reconstruction of dilapidated structures located on prime land. We have not been able to work out a strategy for urban renewal because it is almost impossible to relocate tenants. This has caused substantial distortion in land use.

Loss of Property Tax

Property tax is a major source of revenue for the municipal bodies. In states where octroi has been abolished, property tax is the most important source of revenue for the local bodies. Even in Maharashtra, where octroi is the main source of income for local bodies, property tax is the second most important source of revenue. It is important to note that there is a school of thought that advocates abolition of octroi and rationalisation of property tax structure in such a way as to make it elastic and equitable so that it can yield sufficient revenue to compensate for the loss of revenue in the event of abolition of octroi.

The NCU has noted that one of the extremely harmful effects of Rent Control laws has been the freezing of municipal revenue from property in an era of escalating prices and property values. The Supreme Court has ruled in more than one case that the rateable value of premises cannot exceed the standard rent as defined in the Rent Control Act. Because standard rents have no bearing on real rents, including the lump sum payment, the municipal revenues are denied a just share, by way of property tax, of the true value of property. The NCU had estimated, in 1987, that in the city of Mumbai alone, an additional revenue of Rs 50 crore per year would accrue from property tax if the rateable value could be delinked from the standard rent. In its response to the NCU, the Ahmedabad Municipal Corporation had estimated a doubling of its property tax receipts if such delinking could occur. This is true of almost every city in India.

The 'Delhi Fiscal Study' (December 1998) conducted by O P Mathur and T S Rangamannar of the National Institute of Public Finance and Policy, New Delhi, shows that property tax is the single most important source of income for the Delhi Municipal Corporation (MCD), as also the key instrument for financing municipal services. In 1995-96, the total income from property tax was Rs 267.1 crore, or 63 per cent of MCD's total internal resources and 46 per cent of its total revenue income. Income from property tax has, in recent years, risen at moderate rates mainly in response to measures that have been taken to simplify the tax structure and its administration. At the same time, the rate of growth of property tax income is barely representative of the phenomenal increase in property values and the expansion of Delhi's property market. The property tax system uses the annual rental value (ARV) as the basis of assessment which is hamstrung on account of, firstly, the application of the Rent Control Act and, secondly, infrequent revaluation of properties. Moreover, Delhi's property tax system is beset with an extremely narrow base – only about 30 per cent of the total number of properties are said to be assessed for taxation. It also has an obsolete exemption and rebate policy. It is estimated that MCD is able to tap only about 15-20 per cent of the potential property taxes in Delhi. The study has, *inter alia*, recommended "re-examination of using the ARV for purposes of property taxation, from the standpoint of delinking properties from the provisions of the Rent Control Act and of capturing the appreciation in property values" (pp 44-45, 65).

In his paper entitled 'Enhancing Municipal Fiscal Capability – Issues in Local Resource Mobilisation', Gangadhar Jha of the National Institute of Urban Affairs (NIUA), New Delhi, has brought out that, though a premier local tax, property tax has lost its buoyancy and elasticity over the years. A study of 142 municipal authorities with more than 100 thousand population by NIUA indicated that property tax contributed, on an average, only about 20 per cent of tax revenue. Analysis of data on revenue performance of property tax in the municipal corporations of Ahmedabad, Madras (now Chennai), Trivandrum (now Thiruvananthapuram), Bombay (now Mumbai), Calcutta an Delhi reveals that except in Delhi an Chennai, the role of property tax in th total tax revenue is declining. Decline i much more dramatic in Calcutta where declined from 94 per cent in 1984-85 t about 77 per cent in 1989-90. I Ahmedabad, it declined from 31 per cer in 1980-81 to about 29 per cent in 1989-9 In Rajasthan its share in total revenue i only to the extent of 1.9 per cent. In th state of Gujarat, it accounts for only 28.3 per cent whereas octroi constitutes abou 70 per cent of the total revenue.

According to Jha, the dormant role o property tax is due to a host of adminis trative and legal problems. "By far th biggest jolt to revenue generation has com from the legal provisions. There seem t be basically two reasons. First, the en abling provision in the municipal statute provide for 'reasonable rent' as the bas of property tax. This ambiguous an abstract expression has not been explicitl defined, with the result that the court have given its own interpretation fro time to time. Second, the prevalence o the Rent Control Laws (RCL) has led th courts to interpret the 'reasonable rent' a the fair rent or the standard rent to b determined according to the provisions o the RCL. This culminated in the Suprem Court's decision in the Diwan Daulat Ra Kapoor vs the MCD and others (AIR 198 SC 541) when the court said that th reasonable rent is only the standard ren as determinable according to the RCL The provision in the RCL has completel distorted the rental market with the resu that there does not exist a competitiv rental market to provide sufficient signa and evidence for [revision of rentals

according to market forces. It has consequently depressed the rentals which constitute the base of property tax."

The following data pertaining to the Pune Municipal Corporation (PMC) brings into focus the problems of equity and fairness created by the linkage of ARV with the standard rent arrived at under the provisions of the Rent Act. In the year 1985-86, the total number of assessed properties in PMC area was 85,896 and the total demand of general property tax was Rs 6.36 crore. In the year 1995-96, total number of properties increased to 1,63,748 and the general tax demand increased to Rs 36.28 crore. This means 82 per cent of the present demand of the general tax is borne by 50 per cent of the total property owners. Maximum burden of the property tax is borne by middle class and lower middle class flat owners living in comparatively remote places in the PMC limits, while the owners of old large properties in the heart of the city and living in posh localities are required to pay comparatively much lower taxes.

Another major drawback of the present property tax assessment is that it discourages construction of new properties. Based on the principles enunciated in the judgment of the Gujarat High Court in Ahmedabad Municipal Corporation vs Orient Fire and General Insurance Company, properties constructed after April 1, 1984 are assessed at the actual rent which is paid by the tenant if the property is led out. Total taxation is 60-70 per cent of the ARV. It means that the owner of the property, if he correctly discloses the rent he is receiving from the tenant, will be left with about 30 per cent of the income derived from the property let out by him. In addition, he will have to pay other taxes and also maintain the property. This is a big deterrent to construction of housing for being rented. As a result, an honest tax payer will either not invest his money in housing or will keep the property vacant or endeavour not to disclose the full rent received by him.

After the 74th amendment of the Constitution, the finances of municipal bodies have assumed considerable significance as substantial restructuring of these bodies is now on the anvil. The state finance commissions are expected to assess the resource requirements of these and panchayati raj bodies every five years. The Eleventh Finance Commission too has been asked to look into the ways in which the resources of these bodies can be increased. As a part of these efforts, the municipal bodies will also have to raise resources from the market. *Economic Survey 1997-98* (pp 134-35) has rightly laid emphasis on development of a market for municipal bonds. As the Survey brings out, the well developed municipal bond market in the US finances over 70 per cent of its urban infrastructure development. Municipal bonds can either be general obligation bonds where legally permitted taxes and general revenue of local authorities can be used for debt servicing or revenue bonds which rely on specified sources of revenue from facilities or services financed from bond proceeds. In either case, it will mean putting the finances of municipal bodies on a sound basis. As can be seen, an important ingredient of this will have to relate to making the property tax a buoyant and elastic source of revenue. But this will require addressing the above issues pertaining to the Rent Act and untying the Gordian knot without loss of any further time.

Housing Shortage

Reference must also be made to the growing gap between the demand and supply of housing stock for which, among other factors, Rent Act is responsible in no small measure. This has, once again, been recognised in the draft Ninth Five-Year Plan (1997-2002) released by the United Front government in March 1998. It has also underlined that this gap is unlikely to be bridged in the next five to 10 years. In terms of reach-out indicators, new housing stock required is about 9 million units in urban areas and 7.7 million units in rural areas during 1997-2002 and about 77 million and 63 million units respectively in the longer term perspective, extending up to 2021. Housing upgradation has to cover about 7.5 million units and 20 million units in urban and rural areas respectively during the Ninth Plan period. In terms of financial indicators, the investment for urban housing has been estimated at Rs 5,26,170 crore and for rural housing Rs 1,72,930 crore between 1997 and 2021 for new housing, upgradation and extension. A large part, in some cases more than one-half, will be the backlog of investment. In a shorter term perspective of 1997-2002, urban housing investment has been estimated at Rs 1,21,370 crore.

Several estimates are available of the present housing shortage and the projected shortage at a fairly disaggregated level. The National Buildings Organisation (NBO) has estimated the 1991 shortage at 8.23 million, up from 7 million in 1981, but expects the absolute shortage to decline progressively to 7.57 million units in 1997 and 6.64 million in 2001. However, other estimates indicate that the shortage will increase to 9.4 million units in 2001 (Habitat II estimate).

Successive five-year plans have recognised that housing will have to continue to be a people's activity and government intervention will have to be kept confined to meeting the housing needs of the lower sections of the housing market and selected disadvantaged groups whose needs may not be effectively or adequately met by market driven forces which will, in other cases, be a prime mover of housing development activities, particularly in the urban areas.

The key objective of the National Housing Policy (NHP) is to provide access to adequate shelter for all. Several enabling programmes are expected to achieve this objective. These include, among others, amendment to the Urban Land (Ceiling and Regulation) (ULC) Act to expand the supply of land, enactment of the model rent control and apartment ownership legislations and schemes to link up housing and income generation programmes for the poor (see Government of India, Planning Commission, *Ninth Five-Year Plan (Draft) 1997-2002*, Vol II, March 1998, pp 305, 317-329). After prevarication for several years by successive governments at the centre, the Bharatiya Janata Party-led coalition government at the centre has issued an ordinance to repeal the ULC Act on January 11, 1999. However, action on several other major points, including amendment of the rent control enactments, is still awaited.

In this connection, the recent experience of the enactment of the Delhi Rent Act, 1995, is very significant. Even after being assented to by the president of India, though over three years have elapsed, the Act has still not been notified and has continued to be a dead letter. This Act was enacted by parliament for overcoming the short comings noted in the existing Delhi Rent Act. The objectives of the new law, *inter alia*, are to increase investment in housing, particularly rental housing, and also to balance the interests of both the landlords and tenants. The provisions of the Act include exemption of certain categories of premises and tenancies from the purview of the Act, creation of tenancy to be compulsorily by written agreement, periodical increase in rent, eviction of tenants on specified grounds and limiting inheritable tenancies. After taking into consideration various representations, the government decided to amend the Act, even before it was brought into force, to make it more acceptable to all concerned and at the same time encourage increased investment in the housing sector (see *Economic Survey 1997-98*, p 148). Common Cause, a non-government organisation in Delhi, has filed a public interest litigation in the Delhi High Court against this unconscionable delay in giving effect to the law after it was passed by parliament. The decision of the court is still awaited. This is hardly the kind of example which the central government should set before the states while exhorting them to amend their rent control legislations.

The need for a rent legislation which will treat tenants and landlords in an equitable and fair manner has been repeatedly emphasised in various studies and reports such as of the Economic Administration Reforms Commission and the NCU. The observation of NCU that, "the real solution to the housing problem of our cities lies not in merely maintaining the status quo but in encouraging massive addition to the housing stock" does not need to be over emphasised. In this light, the commission had recommended that the Rent and Accommodation Acts be rationalised with the following objectives in mind:
(1) the protection of existing tenancies,
(2) the institutionalisation of a system of rental increases, as per a prescribed formula, so that whilst on the one hand, tenants continue to pay a reasonable rent, on the other it is possible for some additional money to be found for building maintenance,
(3) delinking of non-residential tenancies from the purely residential so that commercial activity begins to pay the market rent,
(4) the offering of incentives for new construction so that more and more housing comes on the market, and
(5) improving the tax base of local bodies by facilitating realistic valuation of properties.

Model Rent Control Bill

The model rent control legislation circulated by the central government to the states in July 1992 contains a number of salutary provisions which will go a long way in ushering in the long overdue reforms in this sector. In the light of the discussion in the foregoing paragraphs, it will be relevant to refer to the following forward-looking provisions in the proposed legislation on fixation and revision of standard rent:
(i) Standard rent to be fixed on the basis of 10 per cent or such percentage return as the state government may decide on total cost consisting of two components, viz, market value of land in the year of commencement of construction enhanced in the manner specified in (ii) below and cost of construction plus, where applicable, the cost of renovations or major repairs. (Even for leased premises, the value of land will be the market value at the time of commencement of construction).
(ii) The standard rent so derived is increased by a certain specified percentage to arrive at standard rent for the given year. This percentage may be higher for non-residential premises. The percentage can vary from state to state. In case of Delhi, the suggested rates of increase are 4 per cent (1950-60); 6 per cent (1960-70); and 8 per cent (1970 onwards), though the inflation rate is higher.
(iii) To this standard rent are added charges relating to maintenance and amenities and payable taxes on *pro rata* basis to derive the total amount payable by the tenant. (Where Apartment Ownership Act is applicable, the *pro rata* cost of maintenance of common facilities will be borne by the apartment owners.)
(iv) The new standard rent is to be applicable to all existing tenancies, and rents of these tenancies are to be raised gradually over a specified period according to a specified schedule, and the level of neutralisation can range from 25 to 100 per cent, in direct proportion to the size of premises with 25 per cent for premises with less than 25 square metre area and higher percentage for larger premises. To lighten the burden of incremental rent on the tenants, a longer adjustment period of five to seven years can be considered by individual states. A tenant can vacate the premises any time during the period of adjustment. Any new tenancy created during this period will bear the same rent as is specified in the adjustment schedule.
(v) Revision of standard rent initially fixed is to be made after a period of every three years on the basis of criteria notified by the state government.

The inordinate delays and dilatory court procedures in settlement of disputes pertaining to tenancy and rent matters has been another cause of serious concern. The courts are unable to cope up with the ever increasing workload of such cases. This has led to extra-judicial or parallel systems of settling such disputes through the intermediacy of criminals, thugs and mafia, particularly in metropolitan cities like Delhi and Mumbai. It is therefore imperative that a fresh look is taken at the existing institutional machinery, procedures, laws and so on. This too is sought to be addressed in the model rent control legislation. Special attention may be invited in this connection to the provisions in the draft legislation pertaining to streamlining of judicial procedures. These comprise:
(a) Enabling states to establish Rent Tribunals by a Constitutional amendment to include tenancy matters under Article 323(B) of the Constitution.
(b) Permitting pre-trial conciliation/compromise between landlord and tenant at any stage of litigation.
(c) Simplifying procedures of litigation by providing for filing of petition before Rent Controller and appeal before the Appellate Tribunal on prescribed form. This will curtail the volume of pleadings and restrict the proceedings to the real issues. The Rent Controller and the Appellate Tribunal will follow the essential procedure of a fair trial and shall lay down their own procedure. The Code of Civil Procedure shall not be applicable. The adjudication procedure will provide for final adjudication of cases within a stipulated period, say six months, without scope for either of the two parties to prolong the proceedings in any manner whatsoever.
(d) It is proposed to have judicial Rent Controllers as the first forum with original jurisdiction to handle tenancy disputes and an Appellate Tribunal to substitute for the high court. Jurisdiction of civil courts will be ousted.
(e) The Appellate Tribunal will be composed of a chairman and such members as the state government may decide. The Appellate Tribunal shall have all the powers of the high court.
(f) It is open to the state governments to extent the jurisdiction of the two-tier system to cover tenancy and other disputes in regard to properties not coming under rent control law if they can undertake to strengthen the set up suitably without affecting the main objective of speedy disposal of cases relating to controlled premises.

Price of Populism

The above analysis brings out the seriousness of the issues and their continued neglect over decades. Proliferation of slums in all towns and cities is a direct fall out of these short-sighted policies. All available evidence shows that persons belonging to even lower middle class and middle class families have to stay in slums for want of suitable rented accommodation. Instead of addressing the root cause of the problem, the government of Maharashtra, for example, has announced populist policies of providing free accommodation to all slum-dwellers. The disastrous experience of the scheme in Mumbai shows the futility of dealing with issues in this irrational manner.

Fortunately, the wheel does not need to be reinvented. The Model Rent Control Bill, evolved through intensive discussion between the centre and the states, has addressed a number of these issues. But, as in several other matters, what is lacking is the political will to act. We, as a country, have failed to make use of fora such as the National Development Council, Inter-State Council or the Chief Ministers Conferences to evolve a national consensus on such vital issues. No one can advocate the substitution of people's will through their elected representatives for decisions on these matters by judicial pronouncements. But we are left with no alternative. It is not therefore surprising that the question of evolving sensible policies on rent control has once again been taken to the Supreme Court. It is time we redefine this typically Indian version of democracy – courtaucracy – where the higher courts have to take over the responsibilities of state legislatures and the parliament.

Sweet Dreams: Andhra's *Vision 2020*

RV

The aim of Chandrababu Naidu's Vision 2020 *is to present a coherent agenda for action. A long list of objectives has been prepared and gathered together under appropriate sectoral heads covering social and economic goals. And these have now been presented for a wider debate in academia and the press, political fora and local bodies. Yet several doubts remain.*

CHANDRABABU NAIDU has done it again! Like an actor addressing a worldwide audience, he has unveiled the much-touted *Vision 2020* for Andhra Pradesh. The document was thrown open for debate at a lavish function on republic day; the fact that the chosen audience included representatives of the central government as well as of other states indicates that, as in the past, the chief minister is looking for a pat on the back from contemporaries and eventual emulation.

Much of the hype surrounding the event is however suspect. The claim that Andhra Pradesh has done something unique is itself questionable. In the past such documents were called perspective plans; today it is more fashionable to clothe them in management lingo. This is bound to be useful when the plan has to be marketed to the press and to foreign businessmen and the chief minister is likely to do this with his usual dedication and aplomb.

The avowed aim of the Vision is to prepare a coherent agenda for future action. A long list of objectives has certainly been prepared and gathered together under appropriate sectoral heads covering social and economic goals. And these have now been presented for a wider debate in academia and the press, political fora and local bodies. Yet, several doubts remain.

The Vision document looks forward to coming achievements without really stating clearly where the state is today. Data drawn on to determine targets is sketchy and unclear. All over the country, in many crucial matters, reliable data are still not available for effective policy-making in core social sectors. Figures churned out by official sources are not validated by independent sample studies. Children out of school, drop-out rates at the primary and secondary levels, population below the poverty line, nutritional deficiencies – these are some essential areas for which dependable information is still lacking. This is partly due to the distance between basic health and educational facilities in the public sector and the most needy segment of the user population; it is also due to the indifference and lethargy of the official machinery. Even such a critical human development variable as the maternal mortality rate is not regularly or accurately computed at the district and state levels anywhere in the country.

One cannot therefore help wondering about the adequacy and quality of the data collected and used by Andhra Pradesh to make its forecasts. How has information been put together and from what sources? Has it been confirmed by independent estimates? A state which has based its Vision for 2020 on the principle of transparency could easily share data with economists and social scientists to enable them to effectively participate in the consultation process. Perhaps the 14 sectoral task forces set up to draft the Vision document in the last six months have already drawn on the ideas and views of eminent academics. Even if this has been done, there is a case for releasing data on the current economic and social situation; the data could even be compiled as an appendix to the main report. Only then can independent judgments be made about the feasibility of attaining the target levels announced for the year 2020.

A major missing element in the draft paper is the analysis of regional requirements. Some assessment of the comparative strengths of three areas – Andhra, Telengana and Rayalaseema – has been made while firming up the economic strategy for the state. There is however a total absence of data and conclusions about the development levels of different regions and districts. This is anomalous in a state which has had a bloody history of agitation on the issue of regional imbalances. Whether the government is unaware of inter-district developmental inequalities or has consciously chosen to remain silent on the matter is not clear.

The adverse effect of the missing database is heightened by the absence of information regarding the methodology adopted to formulate the strategies advocated in the document. A vision for the future cannot exist in a vacuum; it must be solidly grounded in reality. Lack of a historical perspective is a major flaw of the 20-year perspective plan for Andhra Pradesh. To build a bright future, it is essential to develop a sound understanding of what was done in the last four decades in the state and correctly appreciate past initiatives which have succeeded and failed as well as the reasons for such results. The task forces might have studied these issues, but for the proposed public debate to be meaningful, their methodologies and logic should be disclosed and subjected to general examination.

The chief minister's reluctance to linger over past events is however understandable. Just as Manmohan Singh could never admit that the balance of payments crisis of 1990 was the direct result of Rajiv Gandhi's economic policies, the Andhra Pradesh chief minister will never be able to concede that the fiscal chaos in his state can be traced back to the financial adventurism of his father-in-law, N T Rama Rao. Nonetheless, if he is genuinely concerned about a workable and achievable action plan for the state, lessons learnt from past mistakes cannot be ignored nor can full debate and discussion be avoided.

The Vision document does not also give the impression of a certain coherence. True, it is built around three broad themes – social development, growth engines and governance. And yet macro connections are missing – principally the linkages between economic growth and human attainments. Some statements have been made about the importance of health and education for achieving higher income levels, but inter-sectoral convergence which is increasingly being stressed as the major factor in social development has not received adequate attention. The vital relationships between health and literacy or between water supply and sanitation on the one hand and health and nutrition on the other have not been probed or highlighted. Neither is there a wide theoretical canvas on which the future trajectory of development has been plotted.

State planning is of course not yet being done anywhere in the country through economic model building. This is due as much to paucity of data as to the fact that a very large segment of the economy still operates outside the formal monetised network. Yet a perspective plan cannot be a mere listing of sectoral plans; all objectives must fit into a broad framework of incremental investment, capital-output

ratios and the rest. And this is what has been dropped from the Andhra Pradesh vision for 2020.

A possible reason for the departure from normal planning procedures could be the McKinsey intervention. The base papers of the state-level sectoral task forces were eventually converted into the Vision document by McKinsey and Co. The McKinsey stamp is clearly discernible in the economic chapters – mainly in the techniques used to pick industries (and to a lesser extent agricultural activities) which can perform the role of growth engines in the developmental process. Evidently McKinsey is not the best choice for developing country analysis. The Andhra experience gives one the impression that the consultant has only attractively packaged official social sector targets exogenously determined by the usual target-setting techniques. McKinsey's understanding of issues in these areas appears to be limited. This is apparent in some of the 'best practices' chosen from other parts of the world to be followed by Andhra Pradesh. A possible adult literacy model for the state cited is a package used in the US, something so removed from Indian requirements as to be almost laughable!

There is one area however in which McKinsey's contribution is both undeniable and original. The consultant is on firm ground when it comes to offering advice on productive economic sectors like agriculture and especially industry. Growth engines have been picked for promotion if they satisfy three criteria – they must build on the state's strengths, they must be capable of making an impact on the economy and they must take advantage of the opportunities offered by globalisation. Using this matrix, the consultant has selected rice growing, dairy farming, poultry, horticulture, fisheries and agro-industry as growth engines in the field of agriculture and allied activities. The choice exercised in the field of industry is even more meticulous. We get the feeling that the selectors have added a fourth criterion here – the potential for creating additional low-end and semi-skilled jobs. Industries depending on minerals (like cement and granite), tourism, logistics, information technology, pharmaceuticals, leather and textiles are the preferred thrust areas for the state. This is in stark contrast to the normal practice adopted by states of targeting a very large number of industries for priority attention so that the entire purpose of the thrust area approach is defeated. The McKinsey logic and methodology is certainly worth emulating elsewhere in the country so that industrial policy is focused and effective.

McKinsey's (or the chief minister's) macro dreams do not however seem to be based on reality. A compound annual growth rate of 9.4 per cent in per capita income and sectoral rates of 5.7 per cent in agriculture, 10.9 per cent in industry and 11.7 per cent in the tertiary sector (at constant 1995-96 prices) must be predicated on appropriate ICORs and investment rates. It cannot just happen because China or Chile did it. So meagre are the data on which projections have been made that these simply stand out as one-time statements unconnected to past trends and possibilities.

Overall, the document leaves one with the feeling that the chief minister is more comfortable with economic growth than human development. The time and attention given to the productive sectors is commendable, but a better balance should have been struck between increase in domestic product and improvement in the basic health and educational status of the people. Perhaps the chief minister believes that the benefits of higher production will 'trickle down' evenly to the poorer sections in terms of higher incomes and better health and education. Or perhaps he merely sees himself as the messiah of the middle class. Even here, a glaring flaw is the complete lack of a gender perspective. Whatever the Vision envisages for Andhra Pradesh, it offers scant comfort to its women. References made in the document to their requirements and welfare are scattered and unimaginative; they reveal an indifference that is appalling, given the recent chilling disclosure about the sale of girls into prostitution. Surely, there is a better message from the government and the bureaucracy to the worse-off half of the state's population!

There may be no need to stress again the point made at the launching ceremony by the governor of Andhra and ex-governor of RBI, C Rangarajan, that visions must be matched by finance. One hopes that Andhra will succeed in tapping the required resources to transform its dreams into reality. The Vision is more likely to fail for lack of understanding of the processes of social transformation – processes that have so far kept Andhra at the bottom of the scale in all human development indicators in south India and below the average levels for the country as a whole. There are two implications for the Vision in all this:

– poor health and educational levels can act as constraints on the growth process envisaged in *Vision 2020*; and

– increase in incomes can trigger off changes which may accentuate rather than reduce social inequities.

The Vision has no strategy to meet these challenges. What Chandrababu Naidu now needs to accompany his Vision is a Human Development Report, a candid calculation of key socio-economic indices disaggregated to the district level, which looks not merely at development but also at equity and empowerment.

Struggle, Collaboration and Democracy

The 'Indian Community' in South Africa, 1860-1999

Vishnu Padayachee

The political and economic history of Indian South Africans since their arrival in Natal in 1860 has been largely shaped by struggle and resistance on the one hand and by compromise and accommodation on the other over the self-referential nature and political significance of the identities or labels 'The Indian Community' and 'Indian South Africans' by which they came to be known.

THIS brief paper sketches key features, trends and patterns in the social, political and economic history of South Africans of Indian origin – a history which unfolds over some 140 years within a complex and changing global and local context in which the 'grand' issues of race, ethnicity, nation, empire and resistance jostled for intellectual attention and space with more 'mundane' matters of day-to-day survival and unacknowledged instances of micro-level struggle and resistance. The paper focuses mainly on the rich history of the struggle against, or accommodation to, racism and domination, but it also goes on to assess tentatively the political responses of Indian South Africans to the advent of democracy in the mid-1990s, and in the period leading up to the country's second democratic elections in 1999.

I shall attempt here to argue that the political and economic history of Indian South Africans since their arrival in Natal in 1860 has been largely shaped by struggle and resistance, on the one hand, and compromise and accommodation, on the other, over the self-referential nature and political significance of the identities or labels, 'The Indian Community' and 'Indian South Africans' by which they came to be known.

At one level this community has always been complexly stratified: indentured workers, mainly Tamil and Hindi-speaking, and of Hindu faith, came between 1860 and 1911 to work Natal's sugar cane fields; internationally-connected merchants and smaller traders (or 'duka-wallahs'), who were in the main Urdu or Gujarati-speaking Muslims and Gujarati-speaking Hindus followed from about 1872; a small middle-class of clerks, teachers and nurses, predominantly Christian, developed in Natal from about the turn of the century; by the 1940s an industrialised, urbanised and semi-skilled Indian working class filled Durban's clothing, textiles, food-processing, and printing factories; by the late 1980s and 1990s, a highly mobile, and well-respected elite of businessmen, professionals, politicians and state officials had come to play an important role in the making and shaping of the new South Africa.

All these people despite differences in language-roots, religion and class, came to be legislatively defined or described themselves as part of 'The Indian Community'. Until recently, many of these different strata existed alongside one another in segregated districts in relative harmony, although social relations between some segments of this community cannot be described as ever being really 'close'.

Recent scholarship has demonstrated that South African Indian politics, until the mid-1940s, was dominated by conservative organisations such as the Natal Indian Congress (NIC), founded in 1894 by Indian merchants – with the assistance of M K Gandhi, then a young, English-trained barrister, who was brought out by a well known merchant a year earlier to represent him in a legal dispute with another Indian merchant. That politics was crucially shaped by the social and economic stratification of the Indian population and was dominated by merchants and traders who sought to maintain their relatively privileged position in the local hierarchy, in part by claiming their rights as subjects of the British Empire. "Their politics far from unifying the Indian population as has been asserted in the past, were directed specifically towards attaining white recognition of the fundamental differences between the two major social groups in the community: merchants and workers" [Swan, 1985:44].

This scholarship also demonstrates that Gandhi's political philosophy gradually evolved and distanced itself from these narrow views from about 1906 as he immersed himself in broader local struggles. Yet even the 1913 Natal Indian Strike, which forced a minor amelioration in the status of Indian South Africans, it has been argued, resulted principally from the spontaneous response of a brutally oppressed indentured workforce to their appalling working and living conditions, than to the organised efforts of Gandhi or the merchant-dominated NIC.

At another level organised political and social relations between this community and South Africans of 'other races' were complex in character. Organised political relations with the African majority simply did not exist at any level before the mid-1940s, despite the efforts of some academics and media figures to rewrite this history in romantic terms. The early NIC was determined to keep its distance from Africans. In 1936 *The Indian Opinion* argued against an alliance with Africans, who it was said were at an 'underdeveloped stage'. Thus, for example, by 1941, Indian South Africans were still being urged to maintain a separate struggle for social change. The Indian Agent-General in South Africa observed that "by making common cause with them [Africans], our community will only be disabling themselves in the very severe combat that has fallen their cause" [Desai, 1996:6].

Beginning in 1940 a new grouping, experienced in trade union and Communist Party struggles, espousing the cause of a wider 'non-European' oppressed community and pledging closer working relations both within the different segments of the Indian community and between Indians and Africans, emerged from within the ranks of the NIC. In 1945, this radical bloc ousted the conservative leadership which had failed miserably in its strategy of beseeching the Smut's government to grant Indian South Africans limited political, economic and social rights. This change in the NIC leadership led to the formation of a variety of multi-racial alliances, programmes of action and campaigns in the late 1940s and 1950s. These included the 1947 Doctor's Pact between the ANC, NIC and Transvaal Indian Congress (TIC); the 1952 Defiance Campaign against unjust and racist laws, and the 1955 Freedom Charter, which set out the basic demands of the Congress Alliance.

Despite this level of interaction at elite level, relations between Indians and Africans were still characterised by tension, as the violent 1949 Indo-African riots in Durban, in which 50 Indian and 87 African people were killed, demonstrates. These incidents were grist to the mill for the conservative Indian organisations which had managed to survive into the 1950s.

By the early 1960s the National Party government, in terms of its so-called 'separate development' policy, drew some of these latter organisations into an advisory national body, later called the South African Indian Council (SAIC). The SAIC

was set up as the "instrument which [was] to be used for promoting the development of the Indian Community on the road towards ever greater participation in the government..." [Desai, 1996:28], but within the limits of separate development. Largely illegitimate in the eyes of most Indian South Africans, the SAIC nevertheless continued to exist mainly as a vehicle to serve the interests of conservative Indian businessmen. In 1984 it became, for all intents and purposes, the equally discredited Indian Chamber of the Tri-cameral parliament.

On the other side of the political spectrum, the banning of the ANC and PAC in 1960, following the Sharpeville massacre, and the political trials, banishments and repression thereafter brought to an end what one may term 'normal political discourse' in South Africa. The liberation movement turned to armed struggle. Like thousands of others, Indian South Africans joined the ranks of the military, including MK (the ANC's armed formation) and went underground, or into exile, where some rose to prominent positions by the 1970s and 1980s.

But what was life like for most Indian South Africans by this time? In addition to racial discrimination which applied to all Black South Africans, including of course the denial of the franchise itself, an accumulating clutter of laws, decrees and regulations were directed specifically at Indian South Africans, especially in the first 100 years. These included the notorious 3 pound tax on workers who chose to remain in Natal after their indenture: a host of limitations on trading, property and residential rights; and restrictions on inter-provincial mobility within South Africa itself (only lifted in 1972!).

The Group Areas Act of 1950 which destroyed multi-ethnic and multi-racial communities and established sprawling uni-racial townships around Durban and other cities, represented one of the most notorious pieces of apartheid legislation. While some poorer Indians, who had previously lived a precarious existence as tenants of propertied Indians in crowded ghettos may have benefited from apartheid housing programmes, the psychological scars left and the financial loss suffered by the wrenching dislocations enforced under Group Areas legislation are visible among and felt by the victims and their descendants even today.

The government's post-war economic strategy, which coupled import-substitution industrialisation with racial oppression, stimulated a burst of economic growth in the 1960s and early 1970s. Although the major beneficiaries of this growth were whites, Indian South Africans were able to use their relatively better education, English language proficiency and experience in a skill-starved labour market to some good effect. Indian unemployment all but disappeared in the 1960s and 1970s; a growing number of Indians rapidly moved up the occupational structure to become doctors, lawyers, accountants, academics and engineers; many Indians joined the ranks of the racially-divided public service; and Indian entrepreneurship flourished in the narrow, racially-defined interstices of the South African economy. But the majority still remained working class and lower-middle class, albeit under marginally more secure conditions than the African majority. However, the crisis in the South African economy, which set in after c1973, began to have its greatest impact on this segment of the Indian community from the early 1980s.

But let us return to politics. After a period of dormancy and inactivity (the result in part of political harassment) the NIC was revived in 1972, at a time when the anti-apartheid resistance was re-ignited by Black Consciousness ideology. Anti-apartheid activity was also boosted by the massive worker strikes in Durban beginning in 1973, and the Soweto student uprising of 1976. A fresh, younger cadre of Indian political leadership, forged in the student politics of the then Indians-only University of Durban-Westville (UDW, which was set up under apartheid policy in 1960) and in community struggles, effectively took control of key strategic thinking and decision-making in the NIC from the mid-1970s. They led the organisation into the nation-wide student and community protests around 1980; provided the backbone of the progressive, anti-tricameral movement, the United Democratic Front (UDF), in Natal from 1983; and played a leading role in the Congress movement's underground resistance activities throughout the dark days of the 1980s.

The NIC played an important role in support of its senior alliance partner, the ANC, in the negotiations which followed the unbanning of the liberation movements in 1990. However, its strategy of remaining an exclusively-Indian ethnic organisation within the fold of the Congress movement and its style of leadership (what was referred to as the politics of the cabal) were hotly debated issues throughout the 1980s and early 1990s. Many Indian South Africans had turned their backs on ethnic-based politics and joined and rose to leadership positions in the non-racial trade union movement.

It has been argued widely that despite its long history and some limited success, the NIC largely failed in its principal objective and raison d'etre of winning support for the ANC at the first democratic elections in April 1994. Although the nature of the voting system makes it hard to know exactly how Indians voted, analyses of the 1994 election results in the overwhelmingly Indian electoral district of Chatsworth (a sprawling Indian township on the southern flank of Durban), for example, showed immense Indian support for the National Party. At the national level 64 per cent of Indians in this district voted for the Nats, and only 25 per cent for the ANC. At provincial level, 44 per cent voted for the Nats, 19 per cent for the (conservative-Indian dominated) Minority Front, and 22 per cent for the ANC. Buthelezi's Inkhata Freedom Party (IFP) received less than 5 per cent at each level [Desai, 1996:89]. Although voting patterns in middle-class 'Indian suburbs' may have been different, showing more support for the ANC, I would surmise that the ANC overall only received about 30-35 per cent of the total Indian vote.

Clearly neither the NIC nor the ANC were able totally to allay fears over cultural, religious, language, and property rights (which appeared to have been the main concerns of many Indian voters) in 1994. The ANC leadership was furious and flabbergasted by these results. The president, Nelson Mandela, made this clear soon after the 1994 elections:

> In the Indian and Coloured areas you found as much as 70 per cent of the population voted against an African government. They decided to vote to be part of a minority and not the majority, they decided to be part of a past which has divided us, created conflict, hostility, instead of being part of the future...[Desai, 1996:88].

I would argue (in the years since the election) that some of the fears that drove many Indian South Africans into the arms of the Nationalists may well have been allayed by the reconciliatory and moderate politics of the Government of National Unity (GNU). However, some new fears and vulnerabilities may well have surfaced, around issues such as affirmative action, job security, crime and, most significantly, about the quality of schooling for their children (education has for long been an important issue in the struggle for social and economic advancement among this minority community). Regrettably, these fears appear to have ignited, among poorer and more vulnerable sections of Indian South Africans, a racial intolerance which is (arguably) as strong as any which existed before in this region. There are danger signals here (as in parts of the western Cape among poorer, vulnerable

'Coloured' voters) that should not be ignored as the country moves close to the second democratic elections in 1999.

The GNU's economic policies have impacted differently on different sections of South Africa's Indian population. Thousands of working class Indian South Africans, including many women, in industries such as clothing, textiles, and auto-manufacturing had to deal with the traumatic prospects of unemployment and poverty which some have argued are in part the result of the GNU's stringent macro-economic policy and rapidly liberalising trade and industrial policy. Other Indians having secured a good education, and some economic success and capital in the apartheid decades of the 1960s and 1970s have begun to catapult themselves on to the world stage as leading players in commerce, finance, industry and the professions. Long-established Indian-owned companies such as the AM Moolla Group have taken the opportunities offered post-1994 to break out of a 'corner-shop' culture, and have successfully listed their companies on the Johannesburg Stock Exchange. Some newer entrepreneurs, like Vivian Reddy, have been involved in some mega-black empowerment deals in recent months. Local Indian businessmen have forged new links with south Asian companies, especially in Malaysia and Indonesia, and strengthened links with the Indian sub-continent. The previously Indian-owned New Republic Bank, for example, now has a majority Malaysian ownership. On the political front, many (perhaps too many in the view even of some Africanist-leaning ANC members) have secured some of the top positions in the new government and bureaucracy (potentially a problem for the ANC in the years to come).

Among the largest middle-strata of Indian South Africans (i e, excluding at the top, the most politically well connected and economically well-off, and at the bottom, the very poor and marginalised) a disproportionate amount of time, energy, and resources are devoted to strategising and planning futures outside this country, in places like Australia, New Zealand and Canada, where their skills (and those of their children) as skilled professionals and entrepreneurs are less under threat from the GNU's affirmative action programme. In this sense the response of this section of the Indian community is little different from many among the other minority communities in the same class position.

What does all this imply for the second democratic elections which constitutionally have to take place before mid-1999. While the new winners among Indian South Africans may well have already lined up firmly behind the ANC, vulnerable, unemployed and working class Indian South Africans may either be driven further back into a conservative, inward-looking, ethnic politics or (less likely) they may consider joining up more enthusiastically than they have to date with non-racial worker and community organisations. It is also possible that many Indian South Africans, both rich and poor, may decide that it is time to retreat from struggle and politics altogether.

A significant degree of apathy appears to exist among Indians (and in fact among the population as a whole) in respect of registering for the next elections. Closing dates for registration are behind us already, and it is likely that, given low registration figures, political parties may pressurise the government and the independent electoral commission to set aside further dates in January or February for registration. Political parties seeking the Indian vote (which may be crucial in some areas, such as urban districts of KwaZulu-Natal) appear to have adopted different tactics in respect of getting Indians to register. The more centre-right or conservative parties such as the Democratic Pary, the New National Party and the IFP appear to be very active in this regard, confident that the majority of Indians will not vote for the ANC. And some leading members of the NIC/ANC in Durban also recognising this, have proposed that the party should not spend too many resources on encouraging Indians to register, as they (Indians) are likely to vote for parties other than the ANC. My own view is that a large (even perhaps a majority) of Indians eligible to vote will either not register or, even if they do, will not bother to go to the polls to cast a vote. This will be the real contrast with 1994. Among those who do vote the percentage voting for the ANC may drop, but perhaps only marginally.

Let me conclude: Indian South Africans have contributed richly to the political and economic history of South Africa over the last 139 years. But their story is neither (as it is often romantically portrayed) simply one of political progressiveness in the struggle for a non-racial democracy, nor one of enviable and exemplary economic success in the face of massive racial odds. While each of these versions may contain some element of truth, neither adequately captures the complex role and history of this community of some one million people in the making of modern South Africa. For there were amongst them heroes and villains, resistance fighters and collaborators, rich and poor, winners and losers, and many who chose to sit it out on the sidelines. But then, anything else, surely, would have been highly unusual indeed.

Resolving Hindu-Muslim Problem

An Approach

Asghar Ali Engineer

There is a tendency to oversimplify history and project current notions of conflict among Hindus and Muslim backwards into the past. There is a need to examine historical events in their richness, depth, complexity and ambiguity in order to understand the nature of the current tensions.

I

IT is banal to state that even after years of independence the Hindu-Muslim problem is as distant from a solution as it ever was. If anything, it has worsened. There are many reasons for this, and they pertain to the political, the socio-economic, as well as religious sphere. Regrettably, political processes are getting increasingly communalised in our country. Socio-economic constraints and the slow rate of development intensify rivalry between different caste and community groups. No wonder then that communal and caste problems are becoming more intractable. Both politicians and competitors for economic resources and jobs invoke religion for their respective ends. Thus, it appears as if religion is the main culprit and the whole fight is religious. In fact, this is not the case. However, since this is the general perception, and it is perception which matters, not reality, we must deal with the religious aspect as well as all the others, so as to create a spirit of co-operation between the two major religious communities of India, i e, Hindus and Muslims. We wish here to project the Islamic viewpoint on the communal conflict.

II

Islam has been greatly misunderstood, thanks to bigotry and fanaticism on both sides. It is thought to be intolerant of other religions, especially of Hinduism, and is also projected as aggressively expansionist. Sociologically and psychologically speaking, when we confront an idea or a system of ideas in a conflict situation, our view becomes prejudiced. Islam and Hinduism, on the political level, have confronted each other in conflicting situations, each trying to steal a political march over the other. Hence the political elite from both communities have developed a highly prejudiced view of each other's religion and also of each other (although there have, of course, also been instances of political collaboration between sections of the two elites). On the level of the masses, on the other hand, Sufis and folk Islam have become popular and evoked no animosity. We shall deal with this separately. First, we shall examine some of the Islamic teachings to see whether Islam encourages pluralism in matters of religion or not, so as to judge correctly its potential for peaceful co-existence with other religions. The *Qur'an* states emphatically: "For everyone of you We appointed a law and a way. And if Allah had pleased He would have made you a single people, but that He might try you in what He gave you. So vie one with another in virtuous deeds" (Q 5:48). This verse unambiguously encourages pluralism. It clearly says that "for everyone of you We appointed a law and a way", and that "if Allah had pleased He would have made you a single people", but obviously He did not, since He wanted to try humans and see whether they could live in peace despite plurality of religions and faiths. We are to live in harmony by way of excelling one another in performing good deeds. Also, the *Qur'an* repeatedly says: "To every nation We appointed acts of devotion, which they observe, so let them not dispute with thee in the matter, and call to thy Lord" (Q 22:67). Another verse says: "for every community We have ordained certain rites that they may commemorate the name of God by reading it over the cattle We have given them for sacrifice' (Q 22:34). In yet another verse the *Qur'an* repeats the theme in these words: "And everyone has a direction to which he turns [i e, everyone has a way of worshipping Him] so vie with one another in good works" (Q 2:148). Also, a Meccan sura states elaborately: "Say, O disbelievers, I do not worship that which you worship and neither do you worship that which I worship And I will not worship that which you have worshipped and neither will you worship that which I worship. Unto you your religion and unto me my religion" (Q 109). One can find more such verses in the *Qur'an* which do not approve of any compulsion in religion. "There is no compulsion in religion", the *Qur'an* unequivocally declares (2:256). It is also thought that Muslims are required by the *Qur'an* to demolish the religious places of other communities and construct mosques. The *Qur'an*. states the contrary: "And if Allah had not repelled some people by others, cloisters and churches and synagogues and mosques in which Allah's name is much remembered, would have been pulled down" (Q 22:40).

It is clear from the above verse that Allah's name is remembered, whether it is in mosque or synagogue or church, and that Allah has protected all places of worship by repelling one set of people by another, i e, those who did not protect these places were repelled by Allah through those who could do so. Thus, there is clear disapproval of non-protection, not demolition of any place of worship. Any Muslim who demolishes or justifies demolition of any place of worship is clearly acting contrary to the injunctions of the *Qur'an*. The second Caliph, Umar ibn al-Khattab, did not pray in the church of Palestine when he visited it during his sojourn in that city. When the Archbishop of Palestine inquired of the reason, the Caliph said that no pretext should be provided for Muslims who later might claim the place on the grounds of their Caliph having prayed there. Thus he took the necessary precautions in order to prevent a church being claimed by Muslims for conversion into a mosque. Both the *Qur'an* and the practice of the Prophet's Khalifa pronounce against demolishing any place of worship, whatever religion it belongs to However, it must be admitted that practice rarely conforms to the ideal. Motivated by political vendetta, some Muslims have ravaged not only some non-Muslim places of worship, but also their own holiest place of worship, the Kaba. In the early history of Islam the soldiers of the Umayyad Caliph Yazid burnt the Kaba, as it had been occupied by his political rival, Abdullah bin Zubayr. (Tabari, however, maintains that the fire was accidental.)[1] Whatever the case, it is a fact that the Kaba was surrounded by the forces of Yazid and battle was waged there.

It is also maintained by some that Islam believes in beheading all those who do not believe in Islam. This claim has been partly answered by the verses above. When there is no compulsion of any kind in matters religious, where is there room for converting a person at the point of the sword? As for the word 'kafir', it has been greatly misunderstood. It is necessary that it should be seen in its proper perspective. Kafir,

literally, means disbeliever. Anyone who disbelieves in the truth revealed by god. is 'kafir'. But it is important to note the statement of the *Qur'an* that all that was revealed before to other prophets, was also from Allah, and that Allah has sent prophets among all nations to speak in their own language. "And in or every nation", the *Qur'an* declares, "there is a messenger. So when their messenger comes, the matter is decided between them with justice, and they are not wronged" (Q 10:47). Thus, prophets are sent to every nation and the main purpose is to settle things among them with justice, so that they (i e, the people) are not wronged. Hence all those who believe in one or the other prophet and adhere to the norms of justice, are believers. The *Qur'an* not only requires belief in all prophets, but also equal respect for them without any distinction. "We make no difference between any of his messengers", says the *Qur'an* (Q 2:285). The *Qur'an* also requires that a believer should accept all god's prophets, including those of the past, sent to different nations, without making any distinction among them: "Those who believe in Allah and His messengers and desire to make a distinction between Allah and His messengers and say: we believe in some and disbelieve in others; and desire to take a course in between – These are truly disbelievers.. " (Q 4:150-51). It follows that real disbelievers ('kafirun haqqan') are those who do not accept all the messengers sent by god but discriminate between them. It is also important to note that not all the prophets have been named in the *Qur'an*. The *Qur'an* itself makes this clear: 'And (We sent) messengers WE have mentioned to thee' (Q 4:164).

In the light of this and other verses mentioned above some Sufi saints, such as 'Abdur Rahim Jan-i-Janan (1699-1781, assassinated), have concluded that god had sent prophets among the Hindus too, and likened Brahma to Adam and accepted the Vedas as revealed books. Certainly, it would not be in keeping with the true qur'anic spirit to denounce the Hindus as kafirun as has been done frequently by some sectarian Muslims. It was never the unanimous view of the 'ulama' to reject Hindus as kafirun. The Prophet himself, while concluding a treaty with the Parsis of Bahrain and Oman, accepted them as 'ahl al-kitab' (the people of the Book), although they have not been mentioned in the *Qur'an* as such. Similarly, the third caliph, Uthman ibn Affan, accepted the Berber tribes of northern Africa as 'people of the Book',[2] although it is doubtful whether they possessed any book at all. If the Berbers of northern Africa, whom Ibn Khaldun (1332-1383) describes as barbarians by most uncivilised people, could be accepted as 'ahl al-kitab, why not Hindus, inheritors as they are of a high civilisation and culture, possessing a tradition of sophisticated philosophy, metaphysical theories and physical sciences?

The Arabs in fact were highly impressed by the achievement of the Indians. The famous historian al-Mas udi (d 956/7) observed about India: In the remote past when all other nations were divided into various tribes (i e, when others were at the tribal stage) certain people of India, adorned with the qualities of nobility, rectitude, wisdom and learning were trying to bring together people under a central government. They first established a central authority and claimed to rule over others. They appointed the Great Brahman, the Supreme Leader, as their ruler. It was the age of the ascendancy of the learned. The people made progress in all the fields of life. They extracted iron from mines, made swords and other weapons, built places, studied the heavens and the stars and the movement of the sun.[3] Al-Jahiz (d 869), who was a very talented essayist during the Abbasid period, also has praise for India and its achievements. He says:

> The inhabitants of India are highly meritorious in astrology and medicine. They have a peculiar script. In medicine, too, they have a supreme insight. They have in their possession some strange secrets of the art of Aesculapius...In making busts and statues, in making pictures out of colours and in architecture they are superb...Their music also enchanting. One of their musical instruments is known as 'kanka' (?) which is played on by striking a chord strung in a gourd... There is an uncommon fund of poetical wealth and oratorial affluence in their possession. They know the arts of medicine, philosophy and ethics. The book *Kalila wa Dimna*[4] has come down from them. They have plenty of courage and common-sense and many qualities which are wanting even in the Chinese. Cleanliness is a noted feature. They have good looks, tall stature and a taste for perfumes. It is from their land that the peerless ambergris comes for the kings. Streams of higher thinking flowed down from India to Arabia.[5] [C1][C2]

Abdul Karim Shahrastani, a 12th century scholar of comparative religion, also admits that Indians are a great nation and great (religious) community (*umma kabira wa mills azima*), but they have divergent views and ideologies.[6]

Thus, we see the early Arab and non-Arab Muslim historians shower lavish praise on Indians and things Indian. They were all praise for their religion, metaphysics and ethics as well. Mahmud al-Shabistari, a scholar of the early 14th century, in his *Gulshan-i Raz* even justified idolatry. He says:

> The idol is the expression of love and unity in this world, and to wear the sacred thread is to take the resolve of service. As both faith and unfaith are founded in existence, unity of god is the essence of idol worship. As things are the essence of expression, one out of them must at least be the idol. If the Muslim knew what the idol is, then he would not go astray in his faith. The latter did not see in idol anything but external creation, and for this reason he became kafir in the eyes of the law. If thou, too, would not see that reality that is hidden in the idol, thou wilt also be not known as a Muslim according to law.[7]

As pointed our earlier, the third caliph, Uthman, accepted even North African Berbers, who were nothing more than barbarians as ahl al-kitab (people of the Book).

How could one then declare Hindus kafirun and condemn them? When Muhammad ibn Qasim (694-716, executed), confronted with Hindus, wanted to determine their religious status, the ulama have been hostile to them, often condemning them as kafirun. Why this difference of attitude? To understand this it is necessary to realise that our attitudes towards others are often determined by our interests, socio-economic or political, and the like. The early Arab historians spoke well of India and things Indian as they anticipated the benefits to be had by developing contact with them and trying to learn from them. They were at a lower level of intellectual achievement than the Hindus of India and hence praised them. However, it was different with the latter-day 'ulema'. They were patronised by central Asian Muslim nobles who were in competition with the Hindu elite. It was political hostility which assumed the form of religious hostility, and thus many ulama' came to term Hindus 'kafirun'. It is no wonder that the Sufis adopted an attitude towards the Hindus entirely different from that of the ulama: The Sufis were not aspirants to power. On the contrary, they kept away from it and concentrated on spiritual matters. They found many parallels to the spiritual endeavour in Islam in the spiritual practice of Hindu yogis. Once Nizamuddin Awliya (1238-1325), great Sufi saint of the Sultanate period, was walking with his disciple Amir Khusraw (1253-1325), along the bank of the Jamuna river. He saw some Hindu women bathing and worshipping the sun. He promptly said: *har qewm-ra dini wa qibla-gahi* (for every people there is a religion and a way of prayer). The Sufi concept of 'fana fi llah' also seems to have been derived from the Buddhist concept of 'nirvana' which predates it. It is also important to note that the Sufis did not hesitate to use the local Hindu idiom in putting across their ideas and teachings. A Sufi saint from Maharashtra, Shaykh Muhammad, named his book on Sufism

Yogasangraha. He used Marathi and Sanskrit rather than Arabic terms, for he calls 'dil' (heart) 'antahakaran', 'jalaliyant', 'tamogun' and 'them kamaliyat' 'sadgun'. In fact, he uses all those terms which were used by Patanjali, Shankaracharya (c 700 AD) and the commentators on the Vedantas.[8] Shaykh Muhammad was not alone or an exception. There were many other Sufi saints who thought like him. They were genuinely interested in spiritual practices. They knew that they varied in outward term, but not in content. They were the least prejudiced of all Muslims against the religious practices and the idiom of the Hindus. Some Sufis of Gujarat even project the Prophet as an 'avatara' of Krishna and composed poems to this effect.[9] Also, the doctrine of 'wahdat al-wujud' (literally: unity of being) was universalist on account of its pantheistic contents. The entire universe, according to this doctrine, is a creation of god and reflects his glory. Thus there is no question of fraternising with one section of humanity, since it holds similar beliefs to oneself, while rejecting the other for having different outward beliefs. The Sufi, holding to the doctrine of wahdat al-wujud, fraternised with all.

III

Today, for reasons other than religious, we are almost obsessed with our past. It is essentially political hostility which has, for reasons of legitimacy, been transformed into religious antagonism. We oversimplify history and project into it nothing but religious conflict between the Hindus and the Muslims. However, as students of human affairs, we should remember that human, and especially inter-group or inter-communal relations, are characterised by ambiguity, complexity and relativity. We do not intend to examine this question here in detail. Much has been written about it. All we wish to emphasise is that historical events must be examined in all their richness, depth, complexity and ambiguity. We should also remember, as pointed out earlier, that human behaviour is not motivated by any one factor alone, however important it may be. If this holds true with regard to ordinary human beings, not involved in any significant power struggle, then it applies all the more to the rulers and people in positions of power. Let us keep in mind how much we differ among ourselves in interpreting contemporary event. Take, for example, the Bluestar operation.[10] Did Indira Gandhi order it for her own political motives or because of her hostility towards Sikhism or, perhaps, with the aim of stirring up Hindu chauvinism and thus enhancing her chances in the elections? Had she turned communal or did she conceive of herself as the only leader capable of promoting the country's unity? People will adopt one or the other opinion depending on their political interest or involvement or a priori inclination. The debate goes on. Among Sikhs, too, there is no unanimity of opinion in this matter. When we differ so deeply on a contemporary event, how can we say anything with certainty about the remote past? And yet we state our opinion about historical events with the utmost certitude, completely ignoring the complexity and the possible range of motivation of the historical actors. These were neither religious bigots nor great liberals. They were mainly motivated by their own political interests. Let us not lose sight of these facts. If we adopt this more sophisticated view, much of our perception of history and historical events can change.

IV

A changing society throws up very complex problems, the ethnic problem being one among them. Communalism in India is a modern phenomenon in the sense that with the advent of British rule the socio-economic structure and, in consequence, the political relationship between different communities, especially between the Hindus and the Muslims, began to change. Pluralist societies undergoing change are rarely totally free from communal or ethnic tensions. The communal phenomenon suddenly came to the fore with the feudal-democratic one. This change began to deepen further when socio-economic transformation began to accelerate after independence. New forces and new relationships gradually emerged on our social and political horizons. This transformation again needs to be understood in all its complexity, richness and ambiguity, without resorting to oversimplifications. Most third world countries are experiencing, in varying degrees, ethnic or communal problem. Countries which were considered a model of unity and amity, are being torn asunder by ethnic and communal conflict. Who would have thought just a decade ago that the peaceful islands of Fiji in the Pacific would experience violent ethnic convulsions? The Fiji Indians and the natives began to fight. The conflict, to be sure, was of an economic and political nature. It broke out with the election of a Fiji-Indian supported coalition led by Timoci Bavadra. It generated resentment among the natives who felt left out in the economic and political race for power. The native Fijians asserted themselves, democracy was subverted, and the natives seized power through military dictatorship. The Tamil-Sinhala conflict in Sri Lanka, too, is a result of the changing socio-economic balance there. The Tamils were perceived by the Sinhalas to be a privileged minority. Even Buddhist monks, normally regarded as exceptionally peaceful, got involved in the anti-Tamil movement and resorted to violence. Until recently these countries had known ethnic peace but the developmental process generated conflict. The conflict always assumes communal or racial overtones. Many more examples could be given from other countries of the world. The Hindu-Muslim problem in India to which the Hindu-Sikh problem has now been added, is of the same variety. In reality, the Hindu-Muslim problem is not religious in nature. The conflict, in fact, lies in the secular area. Unfortunately, it expresses itself and is projected in a religious idiom. Whatever may be the case, we have to tackle it from the viewpoint of the perceivers and not only from that of the actors in the drama. The religious dimension, too, has various aspects to it, including the cultural.

V

Our Hindu brothers complain that the Muslims are unwilling to become part of the national mainstream. The claim is partly true and partly not. If we look at it from the point of view of the north Indian Muslim urban elite, it appears to be true. But it is not true with regard to either the north Indian rural Muslims, or to Muslims in general in southern and eastern parts of India. In fact, the centre of gravity of the communal problem lies in the Hindi belt (in which one may here include Gujarat and Maharashtra). The urban elite in this belt insists on a separate identity and has a definite sense of Indo-Islamic culture. The urban middle class Muslims of this belt are quite proud of this Indo-Islamic identity. Furthermore, since the 19th century, the religion has a history of Hindu-Muslim conflict which has been the driving force of the Aligarh movement. Above all, the region was the centre of Muslim power. In this belt, especially in its urban areas, live most of those Muslims who are descendants of the erstwhile ruling classes. The political battle for Pakistan was fought mainly by the Muslims living in the Hindi belt. It is, therefore, not surprising if the feeling of having a separate identity is more pronounced among them. Again, it is the Hindus of this belt who feel very strongly about separatist attitudes among Muslims and their refusal to be part of the Indian mainstream. However, the problem has its own complexity and ambiguity, and should not be viewed exclusively in religious terms, as frequently happens.

The roots of separatism are in politics, not in religion. Let us go back in history to search for the roots for this separatism. When emperor Akbar adopted a liberal policy towards Hindus, it created resentment among a section of Muslim nobles,

mainly those who were of central Asian origin. Subsequently, this section of Muslim nobles found their rallying point in Shaykh Ahmad Sirhindi (d 1624), a Naqshbandi Sufi theologian. In fact, it all began with the Naqshbandi, Khwaja Muhammad al-Baqi Billah (1563-1603) in Delhi.[11] Baqi Billah began contacting the Muslim nobles and, later, converted Sirhindi to his views. Sirhindi had been a liberal under the influence of Abu'l Fazl, the famous liberal Sufi intellectual in the entourage of Akbar. Sirhindi, eventually surnamed by his admirers 'mujadid-i alf-i-thani' wrote letter ('maktubat') to various Muslim nobles stressing the importance of Islamic orthodoxy, opposing the un-Islamic policies of the emperor. He found support among those nobles who did not want to share power with the Hindu nobles. The tussle continued. Aurangzeb Alamgir (ruled 1658-1707), too, courted the support of Muslim nobles in his effort to wrest power from the heir apparent Dara Shikoh (1615-1659, executed) who, again, was an outspoken liberal. The Muslim nobility sided with Aurangzeb who emerged victorious. Shah Waliullah (1703-1762) also tried to inspire the Muslim nobility of India to restore Muslim power, but he failed.

The central Asian Muslim nobility lost its original identity and developed a new Indo-Islamic one which was both Islamic and Indian. This fact must be recognised as it has much bearing on the question we are discussing. The ingredients of the identity are Islamic as well as Indian. Its islamicness asserts itself in certain circumstances and its Indianness in others, depending on the situation and the constellation of power. After the advent of the British a new phase of the struggle for power began. It was during this struggle that among the urban Muslim elite of north India which was the theatre of the struggle - the Islamic element of the Muslim elite's identity began to assert itself again. This was so because the struggle was between the Muslim and the Hindu elite. The Muslim elite, in order to mobilise the Muslim masses in their support, tried to generate a sharp sense of Islamic identity and separateness among them. There has been a strong element of Hinduism in folk Islam. The names, the traditions and customs and other cultural elements were marked by a strong Hindu influence. The Muslim elite, not for religious but for political reasons, began to urge the Muslim masses to purge their customs of local Hindu elements. The Deobandi ulama on the other hand, during the second half of the 19th century, took up this campaign for religious reasons. They thought that unless Muslims in India practised 'pure Islam', they would, inevitably fall prey to a process of degeneration.

Our main concern is not with this theological and legal stream of thought. We are more concerned here with the political aspect of it. Analysing the conspicuous increase of separatism in 19th century Bengal, Rafiuddin Ahmad says that such changes were due solely to the campaigns of islamisation. Improvements in communication that brought the rural Muslims into close contact with their urban co-religionists, wider diffusion of education, Islamic as well as western, and finally, communal tensions resulting from a variety of social and political factors, all contributed to the increasing aloofness of the ordinary Muslims from their Hindu neighbours.[12] Rafiuddin describes various changes which began to affect the nature of the emerging identity of Bengali Muslims. He observes that the earlier 'nasihat names', written as late as the 1970s of the 19th century, often referred to the Creator as 'Sri Sri Hug', 'Sri Sri Ishwar' 'Sri Sri Karim'. The increasing tendency now was to substitute such 'un-Islamic' honorifics as 'Sri Sri' by 'purer', i e, Arabic and Persian invocations such as Allahu Akbar or Allahu Chani...The style of addressing a person also showed the same trend. 'Sri, Srijuta', and 'Sril Srijuta' of an earlier year giving way generally to such Arabicised honorifics as 'janab', 'munshi' and 'maulavi'. Even the title of nasihat namas underwent rapid transformation. Bengali titles were replaced by Arabic ones, such as 'Tariqah-i-Muhammadiya', 'Akbar al-Ma rifat', 'Bedar al-Ghafilin' and so on. These changes were indicative of the psychology behind the campaigns of islamisation. They also showed how the crusade against polytheism was increasingly taking the road to cultural separatism. A similar process took place.[13] Among other Muslim communities, for example the Meos of Rajasthan and of Haryana who, also, were highly assimilated Muslim communities. Nevertheless, the political competition between Hindus and Muslims intensified during the freedom struggle, and the process of cultural separatism and islamisation reached its height at the time of partition. It was at the time of partition that the Khoja Muslims of Gujarat gave up their Hindu names and customs.[14]

It is proper to view this cultural separatism and islamisation not simply as a facet of Muslim fanaticism but rather as a sociological process which, to a great extent, resulted from the political struggles between the elites of the two communities. It was, furthermore, also the result of a heightened political consciousness. Of course, it is very difficult to say whether cultural and religious consciousness precedes political consciousness or vice versa. It surely is a highly complex process. But it is an empirically established fact that political struggle between the two communities does lead, also, to religio-cultural separatism. In this connection, Indonesia's (and, especially, Java's) example is frequently adduced. The Muslims there have been deeply influenced by the local culture which, by the time Islam arrived, had already been exposed to Hindu culture for centuries. The Javanese and, hence, to a large extent, the Indonesian cultural symbols, are Hindu. Even their national dance is based on the *Ramayana*. Their names also, in many cases, resemble Hindu names. All this is true. But in Indonesia Muslims are in the overwhelming majority and there was, or there is, no struggle between Hindus and Muslims. There is no fear of Hindu domination. The identity formation, is the crystallisation of the ingredients and a cultural one. And the sense of separateness begins with the urban elite, not with the rural masses. As the example of 19th century Bengal makes obvious, there took place a remarkable degree of cultural assimilation, perhaps as striking as that of Indonesia. But things began to change with the increase in education and the intensified struggle between the elites of the two communities. Even today, there is a heightened sense of cultural separatism, among the north Indian urban elites. This process intensifies with increasing communalisation. Even in these conditions there is quite a degree of cultural assimilation between Hindus and Muslims in the rural areas. Their dialect, mode of dressing and social customs have a lot of similarities. A good number of empirical, anthropological studies bear this out.[15]

Whatever the political compulsions or processes, cultural or religious separatism cannot go beyond certain limits. Even at the height of separatism, the identity of the Muslim elite remains, as pointed out before, an Indo-Islamic identity. The Muslims of India cannot get away from their sense of Indianness in the cultural and social sense. Their social ethic is as much Indian as Islamic. Their Muslimness cannot completely submerge their Indianness. The Islamic world also, refers to them as Indian Muslims. In the southern and north-eastern parts of India, like Tamil Nadu, Kerala, Assam, Kashmir and West Bengal (leaving aside, here, the Bihari Muslims of Calcutta), there is a remarkable degree of cultural assimilation between Hindus and Muslims, not only in rural but also in urban areas. They enjoy common social customs, share cultural values and of course, speak the same language as their Hindu co-citizens. In Kerala the marriage ceremony is called 'mangalam', and their marriage customs are matriarchal like those of the Hindus. In Kashmir, the Sufi saints are referred to as 'rishis' (e g, Nuruddin

Rishi, etc). These rishis are venerated by both Hindus and Muslims. In Kashmir another commonly venerated Sufi poetess Lalleshwari (popularly known as Lal Ded), who was a contemporary of Nuruddin Rishi (Nund Rishi). She was a Shaivite and composed poems in the popular language. Kashmiri Shaivism has a strong element of unity of god ('tawhid'). Thus, it would be seen that a sense of cultural separatism is prevalent in a small section of the urban population in north India and its importance should not be exaggerated. And, as pointed out above, this sense of cultural separatism is getting further accentuated due to the intensification of communal feelings.

Electoral processes and political opportunism have much to do with the growth of communalism all over India. If the sense of cultural separatism is to be arrested, instead of attacking it, one would do better to attack communalism and create better and more harmonious relationships between Hindus and Muslims. In trying to tackle the problem of communalism more objectively and fruitfully, two dimensions of the problem must be clearly recognised. First, we must accept the fact that with more education, a sense of one's own identity is bound to develop which would tend to separate him/her from other communities/castes. This is happening with regard to all castes and communities. It is a psychological process. Even dalits (i e, the members of the scheduled castes), due to the spread of education, are becoming highly caste conscious. This seems to be inevitable and must be accepted in the right perspective. The second dimension of the problem has to do with the deliberate attempt by the leadership or the elites of the community to serve their own interests, to build up an atmosphere of confrontation leading to a conscious striving for separatism between the communities. It is this process that we have to bring to an effective end. Confrontation must be replaced by co-operation. Polemics must be replaced by dialogue. We also have to recognise the fact that India has chosen a secular and democratic course and that ours is a pluralistic society. In the modern context democracy cannot be stabilised without secularism, and secularism cannot remain stable without genuine pluralism of both religion and culture.

To strengthen the forces of pluralism (on which secularism and democracy depend) we will have to develop a sense of equal respect for all religions and cultures. Mere tolerance is not enough. In a way, tolerance is a negative quality. It would say: "Since this or that cultural or religious group exists and cannot be undone, let us tolerate it". We must go beyond this kind of merely passive tolerance and inculcate a positive, equal respect for other religions and cultures. Respect is a positive quality. The Muslims should show as much respect for Hinduism as they have for their own religion, Islam. Similarly, Hindus should not view Islam with any sense of suspicion. Hindus do tend to become doctrinaire, although Hinduism is not so. It is the actual living we are primarily concerned with, not merely theory. Islam is, theologically speaking, no less tolerant as shown from the *Qur'anic* verses above. But Muslims are far from being tolerant in practice. Both the communities and, first of all, prominent members sincerely committed to the cause of communal peace must undertake genuine self-criticism of their respective communities. We tend to blame the other and completely ignore our own faults. This is common human behaviour and we are all its victims. Some of us, at least, must come out of this and attempt a bold self-criticism. We will also do better if we recognise that communalism *per se* is bad. It should not be divided into the artificial categories of minority and majority communalism. One feeds on the other. We have witnessed this clearly – if any proof is required – during the Shah Bano and Ram Janmabhoomi-Babri mosque agitation. Here, Muslim communalism was at its aggressive worst which in turn fed Hindu communalism. It appeared as if there was total confrontation between the two communities. Ordinary people, Hindu and Muslim, should recognise that arousing communal feelings and actions is the game of vested interests and that they themselves often become its victims. In most towns, cities and villages they live cheek by jowl and in peace. There is no confrontation among them unless it is created from above. Common people are genuinely religious and far less communal, whereas the elite and leadership are far less religious and far more communal. The Muslim intelligentsia, furthermore, has become supersensitive on religio-cultural matters. They should take into account the sensibilities of the majority community and should realise that in a pluralist society a minimum degree of tension is bound to remain between the majority and the minority communities. They should try not to over-react, as they often do, thus further exacerbating the situation. The Hindus should realise that the progress of the country is possible only when there is communal peace and a co-operative spirit between the majority and the minority. If minority feelings intensify, the integrity of the country will be endangered, much more so with heightened communal consciousness. They should show more consideration and respect for the Muslim minority's cultural-religious sensibilities – although culture is, of course, a much more complex category since it is often common between the majority and the minority, especially at regional levels. Muslims should also realise that the indigenous element in their identity content is very important and should not be de-emphasised. True genuine faith is above pettiness and cannot be seriously affected by imbibing local traditions. In fact, no Muslim community in this world is a 'pure Islamic community', for this is anthropologically speaking, a mythical category. Muslims have imbibed feudal values so deeply that they find it difficult to shake themselves free. But it will have to be done. Islam has very little in common with feudalism.

These are some tentative suggestions for developing a co-operative approach between Hindus and Muslims. It is easier said than done. But let us remember that given will and determination, nothing is impossible. After all, we are engaged in the process of nation-building. In Europe, the process was comparatively simple. Ours is a multilingual and multireligious society and industrialisation is proceeding at a slow pace and we are far from modernised. Great challenges require great determination. We should go about the task with equanimity and sincere commitment.

SAP and the Rural Sector

Ravi Srivastava

Growth, Employment and Poverty: Change and Continuity in Rural India by G K Chaddha and Alakh Narain Sharma (eds); Vikas Publishing House, Delhi, 1997, on behalf of the Indian Society of Labour Economics; pp 473, Rs 475 (hardback).

AS rural India charted its course through the 1980s, large areas of persistently high poverty and worsening land distribution appeared to coexist with several comforting features: agricultural growth picked up in several stagnant regions in eastern India, there was a marked trend towards diversification of agriculture and the diversification of the rural workforce away from agriculture, real agricultural wages picked up in most areas and the incidence of poverty tended to decline. The process of structural adjustment and economic reform initiated in 1991 impacted on the rural sector both through changes in the macro-economic policy framework as well as policy changes directed at the agricultural and rural sectors. The book under review provides a detailed analysis of the elements of change and continuity in rural India based on evidence in roughly the first five years of economic reform.

Growth, Employment and Poverty is a collection of 21 contributions, including an introductory note by the editors, grouped into five main sections: (1) economic liberalisation and Indian agriculture; (2) agricultural growth and rural poverty; (3) changing non-farm scenario; (4) regional development experience; and (5) policy concerns for the poor.

Economic Liberalisation and Indian Agriculture

An evaluation of agricultural policy in India till the 1980s has to provide the cornerstone for any assessment of economic liberalisation in the agricultural sector. G S Bhalla's paper reviews agricultural policy and its impact since independence. The major positive outcomes of agricultural performance have been increased per capita availability of foodgrains (which includes increased economic access as real prices of foodgrains declined) and the spread of agricultural growth to hitherto lagging regions in the east. But at the same time, major weaknesses persisted with a large chunk of the workforce continuing to depend on agriculture.

Bhalla shows that there has been a slow-down in the agricultural growth rate in the first half of the 1990s. Though it is difficult to establish a clear relationship between economic reforms and deceleration in agricultural growth, other negative impacts of the reforms are quite discernible in this period. These include a slow-down in public investment and capital formation, and impact on fertiliser use and composition. Price reforms have included a sharp rise in foodgrain and edible oil prices to give incentive to producers and compensate against rising prices of inputs. But these led to lower offtake from the PDS. Analysing the new GATT agreement (TRIPS, TRIMS, etc), Bhalla concludes that these are likely to be harmful for the development of low cost innovations within the country suitable for small farmers. The general rationale for the new economic policies for agriculture is that they would help to remove the discrimination against the agricultural sector and allow this sector to make fuller use of the opportunities for greater agricultural trade under the new WTO regime. Though the opportunity for agricultural exports could increase, exploiting the potential would require the generation of large surpluses and large investments in infrastructure. But while large subsidies to irrigation and power have compromised the ability of state governments to undertake public investments, on the one hand, fiscal compression has also compromised the ability of the state to reverse the trend in declining public investment in agriculture.

Thus in the short and medium term, SAP may have several negative consequences for agriculture: (1) decline in public investment due to fiscal compression; (2) rising prices of foodgrains would affect the net purchasers of foodgrain; (3) the rising price of inputs would affect the small farmers negatively, since the compensating rise in output prices would benefit only those farmers with sizeable surpluses; (4) there is a likelihood of an increase in regional inequalities; (5) there would be a sharp escalation in the cost of maintaining a safety net. Benefits could accrue from economic liberalisation if and only if the country could mobilise large resources for public investment in infrastructure and research and extension.

Biplab Dasgupta's paper analyses at length the agricultural policies since 1991 as well as their consequences for agricultural growth and trade. Dasgupta concurs with Bhalla and shows that, compared to the preceding period (1985-91), agricultural growth slowed down during 1991-96. But the main reasons for this slow-down are assessed to be policy induced: a slow-down in public investment, particularly in irrigation, and a reduction in input subsidies, particularly that of potassic and phosphatic fertilisers.

Dasgupta's paper carefully analyses the prospects for expansion of agricultural exports in the post-liberalisation scenario. He shows that the share of agricultural exports continues to be low during 1991-95 and suggests that the prospects for agricultural exports were not likely to be remarkable in the future. He argues that there was no case for giving up the goal of food self-sufficiency and agricultural exports required to be given only a secondary priority. Moreover, even if static comparative advantage was in favour of agricultural exports, the country needed to develop a diversified industrial and export base, based on principles of dynamic comparative advantage

Dasgupta also compares the performance of West Bengal and Punjab agriculture. Compared to Punjab, West Bengal has followed a model of capitalist development based on land reforms and local democracy (panchayati raj). This model had unleashed rapid agricultural growth since the late 1970s while at the same time had kept polarisation under check. Dasgupta argues for the desirability of such a model in the context of the poorer regions of the country which otherwise in the liberalised scenario would be left to fend for themselves.

Agricultural Growth and Rural Poverty

The link between agricultural growth, food prices and rural poverty has been the subject matter of a number of important studies following Dharam Narain's pioneering work. Other recent studies show that there is a close relationship between agricultural and rural wages, on the one hand, and rural poverty, on the other. Or

the other hand, as Dayanath Jha and T Haque show in their paper, the link between rural unemployment rates and poverty is not so clear because of the intervening factor of returns to labour. Abhijit Sen's seminal paper establishes that, while agricultural growth and food prices continue to be important determinants of rural poverty, the growth of non-agricultural employment has exercised an important influence on the trends in rural poverty since 1973-74.

Sen argues that in the recent period, i e, the period since the 1970s when there has been an observable trend towards decline in rural poverty, there has been a substantial dissociation between agricultural performance and reduction in poverty. The intermediate and important link is provided by the changing pattern of employment and the behaviour of the labour market. He points out that during the 1980s a large chunk of the incremental employment in the rural areas has come from non-agricultural sources. This non-agricultural employment has exercised a pull on agricultural labour markets and is a major explanatory factor behind the growth in agricultural real wages. The growth in non-agricultural employment was, in turn, sustained by the large (and unsustainable) increase in government expenditure through the 1980s.

According to Sen, explanations of poverty based only on agricultural performance and relative food prices provide a poor explanation of the trends in poverty in the post-structural adjustment period. On the other hand, explanations which include non-agricultural employment and government expenditure as variables provide a much better prediction for the post-1991 poverty trends in India. While the first type of explanations provide a better rationale for a structural adjustment package based on fiscal prudence (which is said to bring down prices) and leberalisation (which is said to improve agricultural performance through improved terms of trade), they do not provide an adequate explanation for the post-reform poverty situation. The latter is primarily explained by: (1) relative increase in cereal prices; (2) decline in government expenditure resulting in a decline in the share of *non-farm* employment. Sen believes that the latter can be stepped up only if GDP increases at the rate of 8 per cent or more or if sufficient effort is made to increase the tax/GDP ratio, but the post-SAP scenario does not provide room for optimism on these fronts.

The other two papers in this section argue for regionally specific policies for agricultural growth, rural development and poverty reduction. T Haque and Dayanath Jha show that while employment elasticities in agriculture have been shown to be declining in various studies, but nonetheless since these are positive, there will be a positive impact of agricultural growth on rural employment, more so in the poorer areas of the country. But it would be a mistake to think that all of the excess labour can be absorbed in agriculture. Growth on non-agricultural employment was a must and required a growth of infrastructure in the poorer areas. G S Guha and Niti Mathur analyse the relationship between agricultural growth, non-agricultural growth, employment and poverty at the agro-climatic subregion level and find considerable variations across the subregions, calling for region-specific solutions. In some of the backward regions, agricultural incomes per capita have inched to poverty-line levels. This has become possible mainly through diversification of agriculture. In some of the sub-regions in Bihar, Madhya Pradesh, West Bengal and Orissa, the yield gap with the high productivity regions in Punjab and Haryana has partially been bridged. This has become possible because these subregions are now able to take better advantage of modern farming technologies.

Changing Non-Farm Scenario

The papers in the earlier sections establish the non-farm scenario as one of the critical factors in the observed changes in rural India in recent decades. The papers included in this section pursue various dimensions of change in the non-farm sector.

Sheila Bhalla's paper focuses on the trends and patterns in non-farm employment in rural India. Based on the pattern of employment diversification over 1961-81, she establishes three distinct patterns of non-farm employment: extremely diversified regions in the major industrial corridors; less diversified regions but with a rapid increase in farm and non-farm employment as in some of the agriculturally developed areas; and least diversified regions in the agriculturally involuted areas. The first form a continuum from the extreme north-west to the south, but also include West Bengal. On the other hand, the backward states in the centre and east still have low shares of non-agriculture in the workforce. By and large, Bhalla echoes Sen's conclusions: that in recent decades, workforce diversification has become increasingly delinked from agricultural growth, and has in turn, deeply influenced the trends in real wages and poverty. She finds the growth in workforce diversification is related to public expenditure in both investment and consumption.

Bhalla points out the results of the 1991 Census show that there is a decline in the rate of urbanisation and a fall in the share of non-agriculture in fresh employment generated. The National Sample Survey thin smaple rounds of 1991-92 and 1992-93 also reveal a retrogression in the employment structure while the 1993-94 survey reveals a partial recovery. As far as female employment is concerned, its share in non-agriculture continues to be below the 1987-88 level. Given the strong diversification in the workforce observed in the earlier two decades, these trends, combined with the falling elasticities of employment in agriculture and the organised sector are quite ominous. Overall, Bhalla concludes that with the compression in public expenditures since 1990-91 and the retrogression in the employment structure, the possible impact of SAP on employment and poverty is a cause of concern.

G K Chaddha's paper further analyses the trends in non-farm employment between 1972-73 and 1993-94 based on NSS rounds. The paper highlights the contrast in the pattern of growth up to 1987-88 and 1993-94. Between 1977-78 and 1987-88, employment for rural male workers experienced fast growth in several non-agricultural sectors including construction, storage-communication-transport, finance real-estate, mining-quarrying, and so on. Rural female workers also experienced rapid growth in employment in construction, transport-communication-storage and mining-quarrying. In their case, manufacturing also showed significant momentum. On the whole, rural workers experienced rates of growth in non-farm employment which compared quite favourably with their urban counterparts. The absorption of the incremental rural workforce in non-agriculture increased with every successive quinquennia (1972-73 to 1977-78, 1977-78 to 1982-83 and 1982-83 to 1987-88). During 1983-88, nearly four-fifths of the incremental rural male workforce was absorbed in non-agriculture while the trend was even more significant for female workers with the absolute number of rural female workers in agriculture actually going down. The position changed quite dramatically during 1987-88/1993-94. The rate of growth of non-agricultural employment more than halved for rural male workers while female workers experienced a near stagnation. The slow-down/stagnation was across the board with only "community and personal services" experiencing an increase in

employment growth rates. Urban male workers, however, experienced higher growth rates in non-agricultural employment in the latter period, and for all sectors (including agriculture) employment growth rates improved. But urban as well as rural female workers experienced an overall decline in employment growth rates, in non-agriculture as well as for all sectors taken together.

Chaddha puts forward three hypotheses to explain the above trends. First, the fiscal compression introduced as a result of structural adjustment has reduced the expansion of employment in the non-agriculture sector. Second, part of the reduced expansion may be as a result of reduced labour supply as children move to schools and out of the labour force. Third, as non-agricultural and manufacturing employment shifts out of the household sector, rural households who have poorer skills and educational skills find it more difficult to compete against their urban counterparts.

The paper by Ashok Mathur and Sadhan Chattopadhyay focuses on issues relating to rural industrialisation in the household and non-household sectors. While secondary sector employment (defined as employment in household and non-household industry and construction) was about 7 per cent of the rural workforce in 1991, rural workers formed more than two-fifths of the industrial workforce in the country. The share of the rural workforce was naturally higher in own account enterprises (70 per cent) but was also quite high (about 40 per cent) in industrial establishments. Also, the share of the rural secondary sector workforce was higher in the non-household sector compared to the industrial sector. In some states, the share of the household sector was as low as 15-16 per cent. By and large, the decadal growth rates of secondary sector employment have been associated with high shares of the non-household sector (Kerala and Himachal Pradesh being strong exceptions).

The authors find that the level of rural development is related to the level and growth of rural industrial employment. Exploring the relationship between unemployment rates (measured in terms of usual status or person days) and rural industrialisation (measured in terms of share of secondary sector employment), the authors find the relationship to be unexpectedly positive. At the same time, there was a positive relationship between pressure on arable land and unemployment, indirectly confirming the 'residual sector hypothesis'. However, changes in usual status employment are correlated with the share of secondary sector employment showing that over time high levels of rural industrialisation may help to reduce unemployment. Further, the rates of growth of secondary sector employment are negatively (though not significantly) related to the levels of unemployment. This relationship emerges because of the influence of growth in non-household sector on unemployment.

The authors also explore the relationship of 1987-88 poverty levels to land per capita, industrialisation, rural development and agricultural growth. The relationship which emerges is in the expected direction but is neither strong nor significant.

Two conclusions are highlighted: the need to provide rural industries with specific forms of assistance to overcome inherent handicaps, and the need to strengthen rural infrastructure and development.

Two papers by S P Kashyap, and Sharma and Jacob stress the relationship between agricultural growth and non-farm diversification. The paper by S P Kashyap is based on a study of Kheda district, where 7 of 10 talukas are in the command of a large irrigation system. Kashyap shows that there was a strong relationship between irrigation-based agricultural growth and non-farm diversification. R K Sharma and Babu Jacob analyse livestock growth and employment. The livestock sector contributes about one-fifth of total agricultural sector output. Its contribution to employment is only a little lower than the manufacturing sector but higher than the services sector. The pattern and growth of the livestock sector and the constraints on demand and supply are analysed by the sector. They also show that the positive relationship between the crop and the livestock sectors (particularly dairy) strengthens the negative relationship between agricultural growth and poverty.

Regional Development Experiences

This section offers rich material on the recent experiences in agricultural growth, rural development and poverty reduction at the state level. The experience of five states (Punjab, Maharashtra, Uttar Pradesh, Bihar and Rajasthan), which are quite disparate in terms of their record of agricultural growth and poverty reduction, have been analysed.

With its record of agricultural growth, Punjab appears to be well placed to take advantage of the opportunities created by agricultural liberalisation. But Sucha Singh Gill's paper does not lend support to this view. Gill finds that the gains of agricultural growth in Punjab were shared widely across regions and groups and real wages of labourers increased quite rapidly in the early decades of the green revolution. Non-agricultural growth and diversification was also mainly a result of the rapid agricultural growth in this period. However, Gill is not sanguine about the prospects of agricultural and employment growth and poverty reduction in the post structural adjustment period. He cites evidence of the exit of small cultivators from agriculture in the face of rising input prices and declining returns from agriculture. Overall, he does not find the prospects of Punjab agriculture being able to compete successfully in the international markets very promising. Thus, he does not rule out some reversals in Punjab's remarkable record in poverty reduction.

In the case of Uttar Pradesh, A K Singh shows that rapid agricultural growth occurred in all regions of the state since the late 1960s. The eastern region, in particular, experienced rapid agricultural growth. This growth occurred alongside expansion of credit, irrigation and fertiliser and improvement in agricultural terms of trade. In the post-reform period, rise in input prices had led to worsening terms of trade. The use of fertiliser fell and its composition became more unbalanced. These factors, combined with a slowing down of public investment in agriculture mainly contributed to a slow-down in agricultural growth. Taken together with rise in the cost of living due to rising foodgrain prices, these had resulted in an increase in poverty in the immediate post reform period.

The impact of recent changes hold special interest for Bihar, a state which has the lowest per capita income and a very high incidence of poverty. Alok Kumar and Alakh Narain Sharma show that during the 1980s, agricultural growth increased somewhat and there was also a decline in poverty. Real wages increased during this period but this increase is not entirely explained by rising labour productivity. GDP originating in agriculture grew at the rate of 2.34 per cent per annum during the 1980s, nearly twice the rate achieved during the 1970s. Foodgrain production, which was virtually stagnant in the earlier decade grew at a still higher rate. The growth in production was almost across all major crops, and resulted from an increase in use of fertiliser and HYV and increasing area under irrigation. Fertiliser consumption nearly trebled, helped by low prices and increase in irrigation. Compared to the rest of the country, the workforce did not show

any significant change between 1972-73 *and 1987-88*. The employment pattern in 1987-88 was overshadowed by adverse *agricultural conditions leading to decline* in agricultural production and a slow-down in several other sectors, including mining, manufacturing and electricity, with only the construction sector showing rapid growth rate. Female employment bore the brunt of the conditions in 1987-88 with an absolute decline in agricultural employment even as the share of female employment in agriculture fell.

While declining poverty in the 1980s could be traced to higher agricultural growth and rise in real wages, government intervention through employment generation and the PDS also seemed to have played a role, particularly during 1987-88. But in the post-reform period, the declining trend in poverty seems to have been halted due to rising prices, cut-back in employment generation programmes, particularly in 1991-92 and 1992-93, and slow-down in agricultural growth. GDP originating in agriculture has declined in real terms between 1990-91 and 1994-95. While employment growth overall seems to be unaffected, this has occurred mainly due to employment growth in agriculture while growth in mining, manufacture and construction has declined. This again pinpoints the criticality of agriculture which seems to be acting as a residual sector in this period. The share of public investment in irrigation (as percentage of plan expenditure) has steadily declined and the tempo of irrigation expansion during the 1980s was maintained mainly due to private investment in tubewell irrigation. In the post-reform period, fertiliser consumption increase has slowed down and price increase seems to be one of the factors. Further, the composition of the fertiliser nutrients has further deteriorated. In the area of electricity and irrigation charges, present low charges appear to be unsustainable and there is a case for charging at least operating costs. Credit flow to agriculture has also declined in the post-reform period. As regards the potential for agricultural exports, the major potential in Bihar lies in the export of fruits and vegetables, but this requires the development of proper infrastructure.

S Mahendra Dev and Ajit K Ranade's paper underscores the wide disparities between regions and between the industrial and agricultural sectors in Maharashtra. Twelve districts, accounting for 60 per cent of net sown area, are drought prone. In contrast to the eastern states agricultural growth rates declined in Maharashtra during the 1980s. Female employment in the non-farm employment, *high in* Maharashtra by national standards, *declined during the 1980s*. SAP could *affect the poor negatively due to increased* prices and lower public expenditure. The authors argue that the deregulation of trade, especially of monopoly procurement of cotton would be beneficial to agriculture in the state. At the same time, while reduction in fertiliser and electricity subsidies would hurt small cultivators, public investment in irrigation required to be stepped up, the effectiveness of employment safety nets needed to be improved and increased emphasis needed to be given to horticultural growth.

As in case of the other states, Vidya Sagar finds a strong relationship between agricultural growth and poverty reduction in Rajasthan. Rajasthan's record of agricultural growth in the 1980s has been led by a rapid increase in oilseeds production and a corresponding decline in the area under coarse grains. This rapid increase has been made possible by various elements of state intervention which include changes in the composition of edible oil and improved support price for oil seeds.

However, unlike the other states covered in the book, Vidya Sagar finds that the early evidence in the post-reform period suggests that Rajasthan has been able to maintain its tempo of public investment in agriculture, increasing use of fertiliser and consequent agricultural growth. The state plan outlay on agriculture and rural development is reported to be quite high. The diversification of the agricultural economy has been facilitated by the expansion of the RPDS. As a result of these factors, the declining trend in poverty reduction appears to have been sustained. But future prospects would depend primarily on the prospects of the oilseeds economy which enjoys a high level of subsidy.

Policy Concerns for the Poor

The final section in the book focuses on the direct strategies to alleviate the conditions of the poor, as well as the development of appropriate and alternative institutions and organisations which could lead to pro-poor development in the post-SAP period.

G Parthasarthy and C S Murthy analyse the experience of West Bengal and Kerala, both states with limited land reforms, to show that even limited amounts of land reform could have a favourable impact on poverty and human development. This is possibly also because land reforms based on mass moblisation may lead to a shifting in the balance of power in the countryside. In the poor states, majority of tenants are small/marginal cultivators, in contrast to the situation prevailing in most of the non-poor states. The authors conclude that the *development strategy pursued in the non-poor* states cannot be undertaken in the poor states without high environmental and other costs.

What will be the role of common property resources (CPRs) and collective action in the post-structural adjustment period? Gopal Kadekodi, in his paper, maintains that while structural adjustment programmes aim at improving welfare and efficiency through reduced transaction and search or information costs mostly in relation to private goods, collective action strategies aim at reduction of bargaining and monitoring and enforcement costs mostly in relation to public goods, open access or common property resources with subtractive individual gains. There is a considerable area of interaction between the two types of programmes and SAP may well have negative consequences for common property or the environment. Hence, the need to design development alternatives with collective participation. The Chakriya Vikas Pranali in Palamau is used to illustrate one such design.

Nirmal Sen Gupta's paper also deals at length with the role and development of common property resources in development and in the livelihoods of the poor. In the recent past, a number of new initiatives have come about which aim at the rejuvenation of the CPR. These are based on people's participation and many (not all) embody traditional knowledge and rules. Sengupta does not find management of the CPRs antithetical to the market: many of the CPRs use to the market to promote sustainable livelihoods. But according to him, the SAP represents a more predatory trend towards CPRs in which overexploitation of CPRs and natural resources results from policy which systematically undervalues renewable natural resources. International agencies and development encompass both trajectories of development – one which has a more sympathetic view of CPR regeneration, and the other which is predatory. An effort has to be made to rate India's abundant resources of renewable natural resources, biodiversity and indigenous knowledge and to chalk out an alternative course of development using these resources. Policy regimes which encourage sustainable development based on these resources have to be carefully identified. Some of the possible incentives and disincentives will be price-based.

In the same vein, M V Nadkarni in his paper puts forward the plea that the

approach of giving the poor productive assets and purchasing power needs to be significantly complemented by an approach to strengthen the common property resources base of the rural areas to provide effective social safety net for the poor, and that social forestry could be an important means for achieving this. But appropriate decision-making and institutions were necessary to ensure that the fuel, fodder, mulch and small timber needs of the poor were met from social forestry initiatives.

In her analysis of social security for the rural poor, Indira Hirway finds that SAP was likely to hurt the poor in the short run, while its medium- and long-term impact depended on whether economic growth could be broad-based and labour-intensive enough to promote the growth of poor agricultural areas and non-farm development which could facilitate the participation of the landless and land-poor households. This would require massive investments in infrastructure and the development of appropriate institutions – in credit, marketing, etc, and also institutions which could promote participative and decentralised decision-making. Hirway analyses the concept of social security and the various social security measures which are in practice. She finds these piecemeal and dissociated from the macro-economic framework. Hirway argues for a comprehensive package whose effectiveness would ultimately lie in the degree to which the panchayati raj institutions and the various organisations of the poor are associated with the design and implementation.

Conclusion

The new course which the Indian economy has taken since 1991 has significant implications for its rural sector and for the vast numbers of people directly dependent for livelihood on this sector. More than seven years down the road from 1991, the existing evidence and the analysis on the impact of SAP and economic reforms is still sketchy. The collection of papers by the Indian Society of Labour Economics cogently addresses a vast set of issues based on evidence from the first few years of reform: ranging from the impact of macro-policies on the agriculture and the rural sector, to impacts at the state level, and the need to develop complementary as well as alternative strategies and institutions based on collective action and sustainable development. The book forms a useful compendium for analysts and practitioners of development.

Of Grains and Greens

Rajeswari S Raina

Against the Grain – Agri-environmental Reform in the United States and the European Union by Clive Potter; CAB International, Wallingford, 1998; pp xi+194.

LITERATURE in the interdisciplinary area of agri-environmental studies can be grouped into two. To make the classification more striking, we can also devote two criteria to this classification. The first, is the reference list. To simplify it without resorting to exaggeration, it reads like a who's who in economics/agricultural or ecological economics, or like a who's who in an eclectic club of environmental history, postmodern green philosophy, radical political economy, aesthetics, development sociology/anthropology. The two groups also fastidiously maintain their distinct language and writing styles. The second criterion is the philosophy that informs the analysis of agri-environmental problems in these studies. It is (almost invariably) the case that the first group takes on either a productionist or stewardship approach, while the second group of the eclectic club follows a holistic or sustainability approach.

Potter's book can be accommodated in the first group; stewardship is the philosophy that informs agricultural production and environmental change discussed in the book. Yet, this book would not be too comfortable there, in the first group, because of its analysis of policy reform with specific reference to the political battles and social campaigns that brought about these policy changes. We are thus urged to admit Potter's work in a class beyond the two traditional groups of writing on agri-environmentalism; it is one of the few studies that tries to bridge the widening gap between the two groups in the literature. It is a rare book on the political economy of environmental policy in the agricultural sector. What makes it an exciting piece of reading over and above its vast canvas and wealth of information, are the emphasis on environmental policy, changes and responses, and a detailed analysis of the processes in different agri-environmental contexts. The latter adds a very important dimension to our questions about the path of future agri-environmental policy.

The book focuses on the processes and consequences of agri-environmental policy changes in the United States (US) and the European Union (EU). Given different political cultures and institutional structures, the evolution of agri-environmental policy has been different in the US and the EU. Yet, there are marked similarities in the processes and the political debates that triggered and led the policy reform movement in these two contexts. The author presents a deft analysis of the evolution of environmental policy for the farm sector in these contexts and eventually leads the reader to agree with his conclusions about the possible paths that agri-environmental policies can take in the industrialised countries. Presented in seven well-defined chapters, the book is a treat to any reader interested in the agriculture sector, in policy reform or processes therein, in the environment, in the impact of regulations/legislations, or even in lobbying.

For, lobbying is the sum and substance of the processes that led to the environmental policy reforms in the farm sector. Both in Europe and the US, environmental groups campaigned initially on their own, and increasingly against a farm sector which was being subsidised by the state to produce more and more damaging environmental consequences. This did gradually change the public appreciation of farmers as environmental stewards. But it was only with the support and active involvement of the farm lobby that the environmental policies came to play the role they did in the farm sector. The powerful farm lobby accustomed to the long period of agricultural support, since the Great Depression of 1929-30 in the US and the mid-1930s in Europe, had to find ways of reconciling the competing goals pursued by the environmentalists and farmers. In the 1980s, increasing policy retrenchment meant that agricultural support from the national exchequer would be reduced substantially, unless otherwise legitimised. In the political bargain struck between the two groups, the farm lobby found in agri-environmental policy, a new way of legitimising government subsidies; the environmentalists though not too happy with the extent of compromise, managed with amazing efficiency and speed, to introduce sophisticated policy ideas and instruments such as 'environmental contracts', and 'conservation compliance' into the debate, and did succeed in gaining

enough green policy space to mark a beginning. What is evident from the experience of these environmental reformers in both the US and UK is "the policy thesis" (p 59). In both cases, the reformers had to tow the line of "agricultural support being the driver of environmental change in rural areas" before they could begin to lobby for policy reform (p 60). This gave policy-makers the 'green' signal to introduce pseudo-green reform: they added agri-environmental policies as an "accompanying measure" to what is essentially a productivist system of agricultural support (p 154).

Carrying on from a delightfully racy introduction, the author reveals some of the important developments in the 1970s and 1980s that led to agri-environmental reform in the industrialised countries. Potter presents an impressive argument in chapter 2, to show that it was ultimately, budgetary pressures than environmental reasons that led to policy reform. Agricultural overproduction, combined with land using technological change had by the mid-1980s put farm support systems in the US and the EU under pressure to find ways of reducing farm support and limiting the environmental consequences of these farm support schemes. Given the scenario of massive policy retrenchment, these environmental policy reforms were seen as instruments to tackle overproduction and pull back price guarantee schemes (in the US and the EU, respectively), while maintaining public subsidy for the farm sector to assure that farm incomes were not affected. Ultimately, these agri-environmental reforms of the late 1980s and early 1990s turned out to be substantial investment of public money into schemes that subsidised environment management in the farm sector; it was in effect an agenda that set to defeat its very existence.

In chapter 3, Potter takes on the US agri-environmental policy from the enactment of the Conservation Deal by the Reagan administration in 1985. The New Deal (as it was popularly known) was the product of an interestingly diverse political coalition: Every party (the farm income supporters, conservationists, environmentalists, supply management groups) had its own interest; they all jumped on to the policy omnibus with the Conservation Reserve Programme (CRP) as the main engine. The CRP was "to assist owners and occupiers of highly erodible cropland in conserving and improving the soil and water resources of their farms and ranches" (p 62), through a system of competitive bidding. The CRP which proved to be too expensive, did not ultimately bring environmental value for money. But it was rather late in the day when the environmentalists noticed this anomaly.

Since 1986, the debate on environmental return to this investment pointed to a basic problem of discretionary powers granted to the USDA and the agencies implementing the conservation title. The decisions regarding eligibility, enrolment targets and bid acceptance criteria were made by the secretary of agriculture, but were gradually changed as the CRP evolved, revealing a significant dilution of the programme's conservation mission.

Despite vociferous debates on increasing environmental value for money spent, the agri-environmental lobby managed to pass the Food, Agriculture, Conservation and Trade Act in 1990, consolidating and refining many of the 1985 reforms. *This* was proof of the pudding; the lobby had managed successfully to shift the emphasis from soil erosion to a much broader set of environmental concerns while retaining the essential features of the act. An 'environmental benefit index' was now introduced to aid the discretionary powers vested with the USDA. Eligibility for conservation title was now based on a calculation of monetised environmental benefits likely to be generated relative to payment. Wetlands, unlike croplands earlier, were now the priority. Despite all this, the programme suffered from lack of long-term planning; over 63 per cent of the farmers confirmed that they would return the land to crops once the 10-year conservation contract expired.

This trend, plus the possibility that the federal government would not provide long-term support for conservation plus the recent GATT negotiations and the vision of expanding liberalised global markets, set the stage for the next phase in environmental policy reform. Here, the conservation options were broadened. Land retirement was not the only means; there was increasing attention given to complementing technologies (such as precision farming and integrated pest management) that would keep land under production with minimal environmental costs. The 1996 Federal Agricultural Improvement and Reform (FAIR) Act originated in a proposal to eliminate all agricultural support (p 134). Though FAIR was enabled by the opportunism presented by a buoyant domestic market, it does reflect the long-term vision of the US towards de-coupling farm support and conservation.

Agri-environmental reform in the UK came way too reluctantly and almost by accident when a group of farmers were subsidised by the Countryside Commission to continue their environment friendly traditional farming in the Halvergate Marshes. Chapter 4 captures the slow and bureaucracy-burdened evolution of environmental reform in the British farm sector. The Broads Grazing Marsh Scheme (BGMS) which offered a flat-rate payment to a group of farmers who agreed to maintain environmentally sensitive husbandry, proves that the concept of "paying farmers to produce countryside" had taken root in the policy circles. This embodies the stewardship approach in the UK. The Agriculture Act of 1986 enabled implementation of the environmentally sensitive areas (ESAs) scheme. Eligibility, scope and coverage, procedures, and criteria for the same were soon drawn up, and the scheme implemented in 12 designated ESAs in UK. "Five-year agreements designed to maintain traditional practices, prevent further intensification and, in some cases, encourage modest habitat and landscape restoration, were soon on offer to several thousands of farmers..." (p 85). The ministry of agriculture, fisheries and food (MAFF) undertook to give specific management prescriptions to each of the designated ESAs, publish performance indicators, and the coverage of agreements and changes in the extent of different wildlife and landscape features (p 86). Though farmer response was enthusiastic, surveys reveal that farmer participation depended on the extent of change that was expected of them, a kind of "goodness of fit" between scheme prescriptions and existing farming system. Steward-minded farmers were definitely a minority

As in the US case, here too policy-makers were soon under pressure to prove value for money. Moreover, the environmentalists were clamouring for ESAs sans frontier, when the bureaucracy had taken over the minutiae of policy design and implementation. Attention was soon shifted to "paying for a product" than subsidising farming in ESAs. The Countryside Commission was entitled to purchase environment from farmers who would (after competitively bidding) provide or supply environment. With the entry of market-based transactions in environmental reform, the 1991 Countryside Stewardship Scheme (CSS) embodying this discretionary principle was introduced. Several features, including participation of farmers with their own proposals for enhancing landscape and habitat, soon made the CSS the most effective scheme of the MAFF.

The CSS and other agri-environmental schemes were, however, going against the set practice of production subsidies which was the ultimate goal of the EU and the US given the increasing prospects of liberalised global markets. The UK environmental reforms had nevertheless set the stage for "issue transformation", a prerequisite for incremental policy change, when change depends on stable coalitions around particular conceptualisations (p 6). This helped the EU to reconcile what was often radically different conceptions of agri-environmental policy in its member countries. Chapter 5 analyses the evolution of agri-environmental policy reform in the EU which drew from the UK reforms to start with but was far more open-ended and permissive. The idea of 'extensification' was at the core of the EU agri-environmental policy dedicated to the prevention and control of agricultural pollution as well as the management of the countryside. This paved the way for a common EU policy towards environmental reform, despite protests from southern member states about reinforcing the nothern bias of rural policy. The Agri-Environmental Programme of the EU, published by the commission by 1990, followed the two-pronged approach to extend the scope of Article 19 beyond specific locations for managing the countryside according to specific prescriptions, and second to use extensification schemes to reduce the intensity of agricultural production and to tackle pollution (p 115). Farmers were now seen as more than food producers; they were also providers of environmental services and the taxpayers were willing to pay. But the EU has come under severe criticism because its AEP is far outweighed by the CAP's price and production support under the MacSharry reforms. Moreover, the very decentralised format of the regulation and its open-ended implementation in each member state may help the agricultural lobby to "exploit the ambiguities... to develop new forms of income support" (p 123).

One major problem with the EU's AEP is the definition of the extent of extensification sought. The "substantial reduction" in input use sought, is not defined. Is the reduction to be made in absolute or relative terms? Will it help if a farmer adopting intensive cultural practices reduces input use marginally? The question now is whether the taxpayers must pay farmers to undo what they were previously (with CAP sources) paid handsomely to do? (p 125). Finally, it may be the case that the open-ended permissive policy reform will have to be replaced with an "adverse selection" of traditional farming especially in the southern states, where the policy will help preserve high natural value farming systems. The agri-environmental policy is still in an experimental state in most EU member states, with each state trying to prove more environmental value for money, as the desire to improve the additionality effects of the AEP reveals.

The final statement, shaping this evolution of agri-environmental policy will come from trade. The WTO demands an internationalisation of agri-environmental issues and policies. Chapter 6 deals with these trade pressures. Potter hopes that the Uruguay Round will mark the undoing of traditional farm support policies and set the stage for a truly liberalised agriculture sector, where environmental policies will not be sabotaged to income support schemes. Farmers will increasingly be contracted to produce public environmental goods in industrialised countries. The collective subsidies to the farm sector will henceforth be replaced by individual merit, where the continued reform of agricultural policies will perhaps be replaced by abolition of agricultural policies. A genuine de-coupling of agricultural support and environmental reform seems to be the scenario for future agri-environmental policies. But, as the case histories and their respective political cultures have revealed, the US and the EU will adopt different routes to arrive at the same goal; a permanent agri-environmental policy space within rural policy.

The concluding chapter 7 is a recapitulation of the evolution of agri-environmental policy in these industrialised countries. Potter points out that agri-environmental policies can no longer be a cover for the pursuit of traditional policy goals like farm income support or control of overproduction. The contrast between the US and the EU environmental reforms (specific environmental audit-based and centralised, versus open-ended and decentralised), raises an important question about the extent to which environmental value can be monetised and the nature of appropriate distribution of the powers of discretion. As evident from all the three cases, US, UK and EU discussed here, land retirement and precision farming, countryside management and extensification have provided environmental goods that are hard to measure and very difficult to assess. In the EU case in particular, the desire to effect additionality, has increased the administrative and transaction costs; are these extensification schemes replicable?

Fortunately, one of the interesting developments in this emerging agri-environmental policy scene, is the policy learning process, the policy assessment process, and the co-evolutionary shift in policy emphasis. All these confirm that change in environmental policy in the agricultural sector is more evolutionary than revolutionary. Potter identifies farmer behaviour as an area where evolutionary changes are called for; once contracts expire and farm support is scaled down and de-coupled, these countries have to ensure that regulations are in place to ensure that some safe minimum standards are maintained. "Policy measures which encourage positive attitudes to conservation will in the long-run be more effective... and will increase the output of conservation goods at any specified level of budgetary costs" (p 160). Unless this change in farmer attitude is effected, the policy shelf-life of these measures will be very short indeed.

The US and the EU may also differ in the paths of agri-environmental reform in future if the west European attempts to promote a long-term 'green recoupling' does succeed lobbying within the EU. The US, given its international position as the instigator of the GATT and WTO negotiations, will increasingly de-couple and focus on engineering environmental improvements into the farming system. The EU, in contrast, may move through a longer period of transition to a liberal market regime, attaching in the process, more restrictive conditions to any income support that farmers may receive. In the EU public support to farmers may be justified eventually as part of a continuing social contract; but this will increasingly be couched in terms of individual merit rather than collective desert (p 161). Both the EU and the US will have to concentrate on defining agri-environmental quality standards – for soil and water quality habitat protection and landscape maintenance; the role and significance of a sophisticated and socio-cultural context sensitive environmental science is not to be undermined (p 161). The book concludes with a few important questions that need to be answered to ensure politically sustainable agri-environmental reform in these countries: what is the correct balance between subsidisation and regulation? are taxpayers willing to support programmes which may not have immediate or measurable environmental benefits? will farmers be willing to take on the role of environmental stewards

being prepared for them" (p 162). While the conclusion leaves the reader with a fascinating list of puzzles and problems to ponder over, it also adds to the enigma of the book.

If this is the process and possible future of agri-environmental reform in industrialised countries preparing to face an increasingly global and liberalised international market, where and how do the predominantly agricultural countries figure in this process and in this rosy environment sensitive future? How, for instance, will the Indian agri-environmental reforms progress? It is now accepted that there is considerable negative environmental output in several areas of agricultural operation in the country. For example, the wheat-based and rice-based farming systems are increasingly threatened by salinity, alkalinity, pesticide and other chemical residues, so on and so forth. The powerful farm lobby in [illegible] demands further input-subsidi[illegible] and price/income support from agricultural policy; and the government concedes. In these successful (green revolution) parts of the country where inputs (number of irrigations or units of fertiliser/per crop) far exceed the research recommended dose, the government has not initiated any reform to curb this unnecessary intensification. In other parts where crop loss due to want of critical inputs/knowledge is routine, the government has been unable to provide any long-term solutions to help these subsistence farmers out of the traditional technology-cum-poverty trap. Will the EU type open-ended and permissive agri-environmental policy be the right option for India? If yes, where will we find the funds to subsidise farmers to produce countryside? Will farmers be willing to play the role of environmental stewards in a poor country where each harvest translates to number of meals, duration and severity of morbidity, access to health and education services, and other essential survival inputs? Who in a poor country would want environment more than food, assuming that there is a question of bargain here?

This is not to say that the book does not mean much to a poor third world country. Conversely, it is to say that the environment and its quality is just as important in India as it is in the US or the EU. In India, we have to find our own agri-environmental policies, our own equations of the balance between subsidies and regulations, our own programmes for the long-run attitudinal change in the farming community, and last but most important, our own decentralised technology generation systems that can ensure participatory development of technologies such as precision farming or integrated pest management to produce the optimum crop from each type of land, while improving environmental quality and reducing pollution. Land retirement as an option in agri-environmental policy, is ruled out in India. There is no doubt that our farmers will respond to a "conservation deal": they are more concerned about their lands than the urban elite or complacent bureaucracy or the vote-hungry politicians are. Perhaps the one group that shares this concern in India is the environmental lobby.

While lobbying as an art is still in a nascent stage in India, the environmental groups are already as split as they are in the rest of the world. Potter's book could have been enriched by a section devoted to the evolution of the environmental lobby in the US and the EU since the 1980s. It was after all the loss of cumulative lobbying power of the environment groups that forced some of them to join hands with the powerful farm lobby to gain whatever little policy space they could. Fundamental philosophical problems in ecological thinking led to the break up of major 'green' groups and dilution of their agenda in the EU member states, in Germany and France in particular. Fierce debates within the green party about possible alliances, future course of action, gains and losses, have added valuable insights to the evolution of environmental reform in the EU countries. The debates presented in this book could have been illumined by the lessons learnt from the history of divisiveness amongst green groups.

Finally, Potter's book calls our attention to the need for evaluation; whatever the context is, industrialised or agricultural, every country will increasingly depend on evaluation reports to decide future agri-environmental policy. Methods and tools of evaluation for sustainable environment friendly agriculture demands inputs from several disciplines. It demands the integration of an environmental ethics of agriculture into the evaluation tools and techniques. In other words, only an ethically informed assessment of agri-environmental change can provide the inputs for a politically and socially sustainable environmental reform in the agriculture sector.

What Did They Mean by 'Public'?

Language, Literature and the Politics of Nationalism

Francesca Orsini

During the late 18th and the early 19th centuries, the Hindi literati tried to lay down general principles and norms for Sanskritised Hindi which alone was to be Indian Hindi. For others, writing off old rules and beliefs and treading new paths was possible and desirable. The normative view prevailed and Hindi, which had the potential of becoming a unifying language, instead became an exclusivist language.

I
Introduction

IN Phaniswarnath Renu's novel *Maila Amcal*,[1] set in north-eastern Bihar in the 1940s, Congressman Baldev tries to impress upon his fellow villagers that he is a dedicated activist by quoting a letter addressed to him by a local Congress leader. Although the letter is in Hindi, nobody can understand it, let alone read it, for it is written in the Sanskritised Hindi of public discourse. The words that villagers would not possibly understand are given in bold.

> सेवा में बालदेवसिंहजी। महाशय! आपको **विदित** हो कि कस्तूरबा **स्मारक निधि** की एक अस्थायी कमेटी गठन करने के लिए कांग्रेसजनों की एक **विशेष बैठक** ता. 8-12-45 को पूर्णिया धर्मशाला में होगी। इस बैठक में बिहार के **भूतपूर्व प्रीमियर** भी **उपस्थित** रहेंगे। इस **महत्वपूर्ण बैठक** में आपकी **उपस्थिति** **आवश्यक** है। आपका, विश्वनाथ चौधरी।
>
> To Mr Baldev Singh. **Sir**! This is to **inform** you that a **special meeting** of Congress members will take place on 8.12.45 in the Dharmashala in Purnea to **constitute** a committee for the Kasturba **Memorial Fund**. The **former premier** of Bihar will also be **present** at the meeting. At this **important meeting** your **presence** is **indispensable**. Yours. Vishvanath Chaudhari

The gloss ('arath') for the audience, interestingly, catches only the meta-message: that Baldev is respected by Congress leaders.

> चौधरीजी भी बालदेवजी से राय लिये बिना कुछ नहीं करते हैं। यह अपने गाँव का भाग [भाग्य] है कि बालदेवजी जैसा आदमी यहाँ आकर रहते हैं।
>
> Even Chaudhariji does not do anything without asking for Baldevji's opinion. It is the good fortune of the village that a jem like Baldevji has come to live here (p 31).

The register of the letter is enough to convey to the villagers that it speaks of power and officialdom. This letter encapsulates in a way the predicament of the public in the Hindi sphere: Hindi, not English is the language of the people and of popular politicisation. Yet the villagers mobilising and seeking links with the city cannot understand it because its public register is not modelled on their speech: it does not spring from the desire to communicate and to vernacularise knowledge, politics, etc, but from a concern over the status and purity of the language. This is reflected in the impersonal syntax and the use of words almost exclusively of Sanskrit origin. But is it just a question of wrong register, or doesn't the choice of this public language even for a private letter exchanged between two political workers force us to ask questions about the understanding of the public in colonial north India that remained relevant to post-colonial India, as well? Do the processes and tensions at work in the language mirror in some way larger social and cultural processes within Indian society?

What I am concerned with here are the ways in which ideas about language and literature reflected attitudes to the 'public' among Hindi writers and activists in pre-independent India, and the institutional space and impact these ideas had. In other words, not only why a certain form of Hindi came to be identified as the future national language but also how it became hegemonic. Also, were there other varieties, and did they mirror different views of the nation and the political community?

The first difficulty is with the word public. No word existed in Hindi to cover the semantic field of the term public. Yet the fact that several words were called upon to express this notion, each with its own history and shades of meaning, seems to me evidence enough that Indian writers were struggling to find equivalents for this crucial word in the political vocabulary of modernity. They distinguished 'sarkari', i e, official, governmental (as in public office, public property, etc) from public as pertaining to the community, which different words like 'jati' 'janta', 'lok', 'sarvasadharan' were called to express. This was the hub of the matter, and the efforts at translation show that this was perceived as a need and lack ('India needs a public') and reveal different views of political community. My understanding of what the word 'did' derives chiefly from Habermas, who defined the public sphere as

> a realm of our social life in which something approaching public opinion can be formed. Access is guaranteed to all citizens. A portion of the public sphere comes into being in every conversation in which private individuals assemble to form a public body...[2]

Although inspired by a similar ideal, Hindi understandings differed substantially from Habermas's model. In a nutshell, I shall argue that we can find two basic understandings of, and attitudes to, the public in late 19th and early 20th century Hindi: (a) a normative attitude that interprets public in terms of jati or community. By normative I mean an understanding of the public and of public institutions as spaces where one set of values is circulated that should constitute the norm for all; (b) a critical attitude that views and uses the public as a space where norms and consensus are questioned in the name of reason or of particular interests and subjects. These two attitudes, which were by no means exclusive of one another, will become clear in the following discussion of ideas about language and literature. As I shall argue, they also translated into different ways of using of public institutions like the press and education and into different attitudes to political participation and the nationalist movement.

II
The 'Public' and Public Language

Public Language, Nij Bhasha, Rashtrabhasha

Language and literature were at the centre of intense reflections about the progress of the country from the 19th century onwards. "The progress of one's language (nij bhasha), is the root of all progress' wrote Harishchandra in 1877, and this

rhetoric was there in all Indian languages, to my knowledge. All underwent a similar process of standardisation and adaptation in order to perform all the uses a modern language was now called upon to perform. The peculiarity of Hindi was that this process happened as a self-definition against Urdu, the dominant public 'vernacular' in north India at the time. Also, from very early on, that is from the end of the 19th century, Hindi was presented as India's potential national language. Without treading on ground already much covered by others, I would like just to briefly draw attention to a significant ambiguity in such rhetoric in Hindi.

> The progress of dharma and of the country rests on the propagation of the mother tongue and on the growth and enrichment of the national literature. To strive and work for the progress of Hindi is therefore presently the first and foremost duty of every patriot ('deshhitaisi')
>
> A man's mother tongue is as important as his mother and motherland. One who does not respect his language, who does not love it and enrich its literature, can never improve the state of his country. His dream of 'svarajya', his vow to improve the country and his praise of patriotism are quite shallow.[3]

The ambiguity is that the rhetoric of Khari Boli Hindi as 'mother tongue' and 'people's language' supported the development of something quite different, a written standard variety Hindi intellectuals and literary associations like the Nagari Pracharini Sabha of Benares (established in 1893) argued with the colonial authorities that Hindi, the 'people's language' ('janta ki bhasha'), was the only one fit for mass education. At the same time, they put pressure on the educated Hindu population of the province to switch allegiance from Urdu or English to Hindi. Using Hindi in a variety of public contexts was thus conceptualised as using 'matrubhasha' and doing 'desh-seva' or service to the country. This notion of 'mother tongue' delegitimised the position both of Urdu and English and of heterogeneous spoken varieties. For whereas 19th century writers like Bharatendu Harishchandra (1850-85) had used the variety of colloquial spoken language in a way that retained the particularity of language use, a generation later Mahavir Prasad Dvivedi (1864-1938) did, and exhorted other writers to do, exactly the opposite. By purging written, print Hindi of colloquialisms and regional usages, by privileging abstract over concrete words, by making Sanskrit loanwords the rule and fixing syntax along regular subject-object-verb lines, Dvivedi 'standardised' Hindi into a written, sober language. This was the language used in the journal he edited, *Sarasvati* (1900-20), employed by literary associations and spread through textbooks. Only in such form was Hindi deemed fit for public matters, for literature and to represent the jati, in a word fit to serve the many purposes of a modern nation.

Such a shift in the language used by journals and literary associations mirrors an analogous process in the attitude to public matters. Only that which could appear under the guise of a 'national' ('jatiy') question was fit to be discussed. What was particular, heterogeneous or could not appear under those terms was not part of the public. This of course does not mean that it disappeared, only that it did not become part of the public self-definition of 'Indian'. Such a language mirrored – and brought into being every time it was used – an (ideal) community of serious, equal, educated and public-minded Indian citizens without any other visible marker apart from education and familiarity with the common cultural tradition. Difference, conflict, caste, particular practices or interests were all pushed outside written language. The debates and campaigns over the 'national language' must be understood in the light of this cultural-political idea.

A second ambiguity had to do with the fact that the scholarly consensus that had crystallised around Hindi rashtrabhasha at the turn of the century was invoked by Hindi activists in lieu of political or cultural consensus. With a normative stance, they used the ostensibly neutral pragmatic and scientific arguments in favour of Hindi and of the Devanagari script to discursively delegitimise other claims and to deny the reality of Hindi's subordinate status in its own region – subordinate to English and, in the minds of the Indo-Muslim elite, to Urdu as well.

'Sahitya-Seva' and 'Rashtriyata'

Like language, literature too had to be thought through again in the light of the new categories of 'people', community and nation. The debates on the meaning of literature in Hindi journals show writers, scholars and critics grappling with the category of lok and the widespread implications it had for how they interpreted their role as writers and the function of criticism. As one critic put it so:

> [Earlier] literature was not created for the common people. Poets and playwrights were honoured only at the courts of a handful of literary-minded rajas and wealthy men, therefore neither did poets worry about the influence of their works on the common people nor did critics feel the need to evaluate the works from the social point of view.[4]

The tension between normative and critical attitudes was strong here: everything from style, taste, content, tradition, criticism and popularity was open to public discussion. And once accepted norms were questioned in the light of what were perceived as the 'needs of the time' and the 'welfare of the people' ('lokhit'), new guidelines and concepts could emerge only after public contestation. This, in turn, raised the question of authority, for if everyone could question them, who was going to set the new norms?

On the one hand, the recurrent metaphor of the 'bhandar' of Hindi that needed to be filled with suitable works reveals a yearning for a normative definition and a consensus about what Hindi literature 'needed' and what readers should read. It also reveals an uneasiness towards the eclectic literary scene and the market of popular publishing and the need to set new rules.

> Earlier by literature one meant a particular code ('sastra') related to the art of 'kavya' containing 'alamkara', 'rasa', 'dhvani', etc. which discriminated between its qualities and errors, as in the *Sahityadarpana*. Moreover, earlier literature used to rule over language, and poetry over grammar, and the literary scholar was the highest authority in deciding if a word was correct. But now since Bolshevism, like the sweep of time, has turned literature into a unified democracy, a rebellion ('gadar') has erupted in the realm of language! Anything which anyone may write in any style on any subject is called 'literature'. Every writer is completely free to write the way he wants. There is no obligation ('pabandi') to follow any rule ('qayda-qanun'), in fact there is no rule to follow![5]

The 'law and order' metaphor expresses well the discomfort and exasperation of the traditional literati with the new publicity of literature which upset the hierarchy of authority and genres.

On the other hand, the new 'Chayavad' poets vindicated the poet's individual right to break existing norms and explore new directions. In highly metaphorical language, Sumitranandan Pant (1900-77), for example, expressed his dissatisfaction with the poetic conventions of Braj Bhasha and the new qualities of Khari Boli poetry. Braj Bhasha poets had not explored the (national) space beyond Braj and the emotional space beyond that of devotion to god or of the various moods of the heroine: "those excellent poets could not

go beyond that three-foot long world from her tip to toe". Khari Boli poetry may lack the precious decorations of the 'temples' of Braj Bhasha but it had 'spacious avenues' and a 'market for novelties' from other parts of the country and abroad ('desh-videsh').[6]

The view of the foremost critic and scholar of the period, Ramchandra Shukla (1884-1941), professor at Benares Hindu University and the author of a seminal history of Hindi literature, exemplifies the normative synthesis of the debate. Shukla subordinated the individual genius of the poet to the welfare of the people and held that litterateurs' aim was to change and improve their tastes ('lokruci'). Only after a poet had read studiously, cultivated a wide intelligence, reflected on contemporary society and its problems and listened to the advice of older, more experienced scholars, could he enter the field of literature, and even then with no freedom to write whatever he wanted. His aim was to capture the 'yugdharma', the 'dharma of the age', 'the ideal distillation of people's taste'.[7]

We see here a peculiar tension between the crystallising of a notion of the writer as the vanguard of society, which bestowed upon him/her great authority, and a subtle form of control, as if only a restrained, norm-abiding and selfless individual had the moral right to be called a writer. This, indirectly, bestowed even greater authority on the critic, who became the appointed judge not only of taste but of a writer's behaviour and would discriminate between those who wrote good and useful literature and those who did not.

III
Print Media

Where and how did these discourses on language and literature circulate, and how much of an impact did they have on north Indian society? In order to answer these questions it is necessary to turn to the social space and dynamics of the various 'institutions' – journals, associations and education – where these discourses circulated. In this way, I hope, their role in enhancing one or other understanding of the 'public' – normative or critical – will become clear.

Journals and newspapers: As Vasudha Dalmia has eloquently shown in her book on Harishchandra,[8] Hindi editors of his time had a very clear idea of the public function and potential of journals, plays, associations as critical instruments of public opinion. Harishchandra's articles, speeches and skits both addressed the community and claimed to represent its views to the colonial government. If we look at developments in Hindi journalism in the early 20th century, we can usefully distinguish four types of press:

(a) Normative Reformism: Mahavir Prasad Dvivedi's *Sarasvati*, the most influential miscellaneous monthly of the first two decades and a model for subsequent literary journals, represents the trend that could be called 'normative reformism'.[9] Dvivedi set the standard in many ways: through his example and relentless work correcting other people's contribution, he established a standard form of Khari Boli prose. Rejecting the language, content and aesthetics of Braj Bhasha poetry, he lay down rules for a new poetry in Khari Boli that would express suitable and inspiring feelings.

He urged poets to write on nature, on historical figures and events and on topical and patriotic matters: for example, a team of 'Dvivedi poets' (including Maithilisharan Gupta and Nathuram Shankar Sharma 'Shankar') was commissioned to illustrate with poems reproductions of Ravi Varma's 'historical' paintings. The most famous poet of the group, Maithilisharan Gupta, wrote successful mythological reworkings and a long poem modelled on Hali's *Musaddas* on the 'past, present and future' of the Hindu 'jati' ('we') which achieved unparalleled success. Only works and authors that corresponded to Dvivedi's tastes and standards could appear in *Sarasvati*. He became an extremely authoritative editor-critic. He was also an extensive and regular reviewer of Hindi publications, and although he was supportive of all works and initiatives that filled the 'Hindi bhandar' his stinging sarcasm directed at works that did not meet his rules were famous. On poetry describing the different kinds of beauty ('nayika-bhed'), he wrote that money could be better spent otherwise, and about popular fiction he urged writers and publishers to change subjects:

> यदि इन ग्रंथों के बनाने, छपाने में जो व्यय किया गया, वह जीवनचरित्र, इतिहास अथवा किसी वैज्ञानिक ग्रंथ के लिए व्यय किया जाता तो भाषा का भी उपकार होता और धन का भी सद्व्यय होता।
>
> If the money spent on making and printing these works were used for books of biography, history or science it would be a benefit for the language and a better use of the money.
>
> (M P Dvivedi, 'Nayika-Bhed', *Sarasvati*, June 1901.)

> मैं इतना और लिखना चाहता हूं कि आजकल ऐयारी, तिलिस्मी, जासूसी और प्रेम कहानी के नाटक उपन्यासों से जो हिन्दी का भंडार भरा जा रहा है, यह भी साहित्य के लिए हितावह नहीं है। इसकी जगह यदि हिंदी के प्रेमी चरित्र शोधक, व्यापार, शिल्प विज्ञान, रसायन, यूरोप और भारत के इतिहास, यूरोपवालों के उन्नति के स्वरूप और साधन आदि विषय में अपनी लेखनी उठाने का साहस करें तो अवश्य हिंदी का उपकार और पाठकों के चरित्र का निर्माण हो सकता है।
>
> I only want to add that the stream of magical, adventure, thriller and romantic plays and novels that is filling the bhandar of Hindi is not beneficial to literature either. If instead Hindi lovers had the courage to take up their pens and write character-building books and books on crafts, chemistry, European and Indian history and on the nature and means of the progress of Europeans it would undoubtedly bring benefit to Hindi and improve the character of readers.
>
> (M P Dvivedi, 'Granthakarom Tatha Prakasakom ke Nam' *Sarasvati*, May 1922.)

He could be equally sarcastic towards contemporary writers such as the experimental Chayavadi poets, whom he called 'illiterate', 'useless' and harmful to Hindi literature.[10] Dvivedi thus embodied the figure of the editor-arbiter, and after he retired from *Sarasvati* his absence was often lamented by those who perceived the eclecticism of Hindi literature as detrimental chaos.

Dvivedi used the journal as a means to spread standard norms and values in the public sphere and took his role as arbiter of public taste very seriously. Despite a self-imposed censorship on religious and political matters, he certainly performed a political role in laying down a blueprint for the Hindi community and drawing their attention to the role and duty of public opinion to check on government administration. As the quotations made clear, he saw the role of the editor and writer as an educational one of 'character building', and the boundaries of the 'public' were very clear.

(b) Literary Openness: The monthly *Madhuri* (1922), although inspired by Dvivedi's example, shows how openness alone made all the difference. *Madhuri* was an open venue for different tastes and different opinions: from Braj Bhasha to the latest experimentations in Khari Boli. *Madhuri* mirrored tastes and changes rather than guiding them. It published old and new poems in Braj Bhasha, showing that the taste for it was far from dead. In doing this it helped the process of realigning the Braj Bhasha tradition on the printed page thus ensuring the continuity of literary transmission. It is difficult to underestimate the importance of Dularelal Bhargava's journals (*Sudha* after *Madhuri* in 1927) and publishing venture, the Ganga-Pustak Mala, for modern Hindi literature.

All the Chayavad poets were published in *Madhuri* while *Sarasvati* still kept its doors closed to them. New writers, both

controversial and unknown, were published: novelty and commercial success were a value for *Madhuri*'s enterprising editor Dularelal Bhargava (1895-1975). Although limited, the space provided by this and other journals was enough to support a growing number of professional writers and a literary market. The openness to novelty and to eclectic tastes and the prestige and (relative) commercial success of the journal were to Hindi writers a tangible proof that Hindi literature had matured and that they were playing a historic role as the cultural vanguard of nationalist regeneration. Also, it was here that a debate on the notion of literature could take place.

(c) Critical Voices: Contemporary to *Madhuri*, the women's monthly *Chand* (Allahabad 1922) provides the best example of the use of the journal as a critical medium and is particularly interesting for our discussion: the strategies by which women's questions and voices contested and extended the boundaries of the 'public' are well worth considering.

Women's columns had started appearing in mainstream Hindi journals and women's journals were becoming more topical, a sign that female readership was recognised, but still as a separate group with separate concerns. It was *Chand*, launched by the enterprising Ramrakh Singh Sahgal (1896-1952), that finally broke the mould of separate 'stri-upyogi' literature, questioned the home-bound role of women and placed women's issues at the core of svarajya, just as socialists would do a decade later with peasants and the economic question. Its immediate success proves it met an existing demand. (With 15,000 copies, it was the most popular monthly in Hindi.[11])

So what did *Chand* do? It broke the boundaries of (a) 'what women should know' and (b) 'what women should say'. In the first instance, it dedicated more space to news than any other women's journal – more than most monthlies in fact. All sorts of political, economic, social and historical topics were presented with no censorship of any kind: scattered among tips on hygiene, such seemingly 'neutral' information carried in fact a much wider and political education than could be achieved through schools by simply exposing women to information they would not encounter elsewhere. Implicit in this uncensored flow of information was the idea – crucial to Habermas's model – that exposure to information itself develops critical attitudes and political awareness by making issues public and the concern of each reader.

Chand carried extensive news on women 'satyagrahis' and women entering new professions or treading new paths, presenting it all as part of the same, irresistible wave of women's awakening. In the editorials the ideal of 'seva-dharma', of 'service', was taken up and redefined in terms that legitimised women's access to the public sphere.[12] Editorials also bluntly raised less palatable issues such as that of women's economic dependence and precarious position in the family and supported strongly the link between education and respectable employment.

The other remarkable novelty introduced by *Chand* concerned 'what women could say'. Publicity was extended to other dimensions of women's lives and especially their emotional needs. Stri-upyogi literature and journals thus far had envisaged women as totally self-sacrificing and focused exclusively on their duties and ideals.

Of course, stressing women's ideals was a strong plank from which to argue for their worth. Yet, by publishing letters and fictional 'true stories' *Chand* not only played a critical role but introduced the recognition of the individual's 'right to feel'. Invariably defending the individual woman's weakness and feelings, this writing highlighted the shortcomings of a purely normative attitude and urged the renegotiation of social and family norms. The 'true stories' of abandonment into destitution, sale of brides, polygamy, family corruption, unlegalised marriages and sexual relations belied the normative image of the 'Aryan family' – often boldly thematising the thin line between marriage and prostitution from the women's point of view. In fascinating ways, these 'true stories' bridged the gap between serious and commercial fiction, from which they borrowed schemata and plots.[13] Letters and first-person narratives introduced a sense of urgency and the powerful element of personalisation: this meant that the reader was forced to come face to face with the cruelty widows experienced in the family (D Chakrabarty).

The helplessness and commonality of the experience of Hindu widows became a metonymy for the condition of Indian women in general. Personalisation also meant that these life stories legitimised women's voices, their right to suggest solutions to their own problems, a new sense of individual worth and emotional life, for example, the need for kin relations to be intrinsically affective. Thus, while male reformers concentrated on widow remarriage or appealed piously to families to treat widows humanely, women's articles and testimonies spoke of a different agenda: they insisted on the right to retain one's property and place in the family; on the need for respectable employment and a place to stay; if 'fallen', to receive the same treatment as the male seducers or unlawful partners.

In other words, *Chand* exemplifies the critical use of the journal as a space where a subordinate or marginalised 'epistemological community' could criticise established views and norms and construct knowledge collectively (Assiter).

If to understand public as jati tended to naturalise definitions and freeze the process of public debate into a new status quo, new voices could exploit the implicit openendedness of publicity to redefine the basis of common sense and the boundaries of the 'public'. For example, 'justice' was introduced as a basic category by both women and peasants, and both posited the necessary connection between 'svarajya' and social change. Such a move required nevertheless additional strategies: to paraphrase Nancy Fraser, when peasant leaders intervened in the public sphere they found that the overarching nationalist 'we' did not really represent them, and when they found a voice and words to express their thoughts they discovered they were not heard.[14]

In other words, publicity itself proved not to be enough for ideas to become acceptable: if for example it was argued that it was not right to marry girls before puberty as common custom maintained (at least for the upper castes, the protagonists of the public sphere in north India), such an argument could do little against social pressure to do so until institutions like girls' schools, other pressures such as a desire for educated wives and even more radical alternatives such as women teaching, writing and taking part in the nationalist movement, made the idea of marrying a girl after puberty sufficiently 'tame' to be accepted

For this reason, extra-discursive forces such as political mobilisation or institutional support hold exceptional importance and are often decisive in determining access to, or exclusion from, the public sphere. To give another example, peasant leader Sahajanand discovered that the best way to press home the point of peasants' participation in the political struggle for svarajya was to hold massive rallies in which peasants could be physically 'seen' and feel their own strength.

(d) Vehicles of Popular Opinion: Political dailies and weeklies such as *Pratap* (Kanpur 1920, ed G S Vidyarthi) *Vartaman* (Kanpur 1920 ed R Avasthi) *Aj* (Benares

1920, ed B V Pararkar), *Sainik* (Agra 1925, ed K D Palival) represent the fourth kind of periodical publication, deliberately moving beyond reformist concerns. In fact, it was from these newspapers that the leadership and manpower for the Congress Socialist Party in UP emerged in the 1930s. Their move implied a different attitude to the public, no longer a middle class, paternalistic view of the Hindi public but a conscious identification with the 'common people' (janta, sarvasadharan).

If Madan Mohan Malaviya (1861-1946) had written in his weekly *Abhyuday*:

> Just like dawn announces sunrise, the birth [of leaders] announces the future rise of the nation. It is they who first dream in their minds the edifice of the nation and *display it in front of the general public* (sarvasadharan) drawing a picture of it with speeches and articles. And through their speeches and articles they forge whatever elements and strength are needed to build that edifice.[15]

now Baburao Vishnu Pararkar (1890-1955) reminded Hindi editors that their peculiar duty was to find out how common people lived, the struggles they went through and mirror them in the newspapers: "Until we adopt the common people and turn our newspapers into their mirror we shall not progress and serve the real ('prakrit') nation" [as opposed to the 'artificial', 'kritrim', one of Anglo-Indian newspapers].[16] This move involved a set of shifts: (a) in subject matter, (b) in language and (c) in attitudes to the Congress and the political movement.

(a) Firstly, news about peasants and workers started to feature regularly and extensively, much more so than in other moderate English and Hindi newspapers (like *Abhyuday* or the English-language *Leader*). *Pratap* was especially involved in the Awadh peasant movement of 1920 supporting peasants' grievances with arguments and taking side against the zamindars. The editor and manager were taken to court and jailed in a famous libel case launched by the local taluqdar. Both *Pratap* and *Vartaman* were active on trade unions issues in Kanpur.

(b) Secondly, there was a shift in language: far from the neutral, impersonal and sober language of *Sarasvati*, the language of these newspapers was much closer to colloquial speech: syntactically simpler, it made frequent use of idiomatic expressions, used few Sanskrit loanwords and more words in current use, not excluding those of Perso-Arabic origin.

(c) Finally, making people, the sarvasadharan, the locus of authority brought several other implications for attitudes towards the politics of the nationalist movement. If the Congress were really the "voice of the whole of India" as it claimed to be, "now those doors must be open which for some reason have been kept closed so far" wrote Ganesh Shankar Vidyarthi (1890-1931) in 1915:

> Now the time has come for our political ideology and our movement not to be restricted to the English-educated and to spread among the common people ('samanya janta'), and for Indian public opinion ('lokmat') to be not the opinion of those few educated individuals but to mirror the thoughts of all the classes of the country. When we agitate for svarajya we should not forget the principle of a famous political thinker that democratic rule is actually the rule of public opinion.[17]

This espousal of the janta carried also a structural critique of constitutional politics. Popular opinion was rightly against the legislative council, wrote *Sainik* editor Shrikrishna Datt Palival (1895-1968) in 1936:

> The councils are temples of 'maya' because ostensibly they are there to help people rule and to hand the strings of power over to their representatives, but actually (pratyaks mein) they fulfill the interests of the ruling and capitalist classes! The whole electoral procedure is a demonic 'maya' ('raksasi maya') from the beginning to the end...In the councils and assemblies one meets power and wealth face to face [and] the rulers' rights are kept safe in a temple where [people's] representatives are denied entry, just like untouchables.[18]

The shift of the Hindi political press from being 'journals of ideas' for the educated few to newspapers reflecting and representing the 'sadharan samaj' is revealing of a point I would like to make later and that is crucial to my understanding of the Hindi public sphere: it was nationalism, particularly nationalist campaigns, that brought together the world of the literate elites and of the 'common people' and lent them an apparent unity.

In the Hindi press we found both normative and critical attitudes to the public. In the first case the journal was used as a way to transmit ideas and 'display the blueprint of the nation' to a public that needed to be educated. Ideas and norms, whether about language or about society, were presented as issuing from an already established consensus. Debate, dissent and diversity were devalued as 'confusion' and easily termed 'un-Indian'. In the second case, newspapers were used as a forum for debate open, theoretically, to all. New voices were not only allowed to raise issues concerning them as public issues, but were invited to do so in order to become part of the overall Hindi public. While in the first case editors favoured the strategy of putting pressure on colonial institutions (constitutional politics), in the second case editors emphasised direct participation and the accountability of leaders to the public they represented. The present age was acknowledged as the age of the masses and called the 'kisan yug'. In this perspective, svarajya had no meaning without social change.

IV
Normative Institutions

This brings us back to our initial question: if the Hindi scene of the 1920s and 1930s was so strongly marked by populist tendencies, critical voices and open debate, how did the Sanskritised Hindi of Baldev's letter prevail? Once again we have to turn to institutional spaces, this time associations and education. For the gradual expansion of polite or 'shuddh' (pure) Hindi as public language, and also of the normative views of language and literature, took place thanks to education and literary associations. They were also closely related in terms of manpower and of cultural attitudes.* It is useful therefore to dwell a bit on the dynamics that made them normative institutions and successful ones, too.

Associations: The Nagari Pracharini Sabha (1893) of Benares is undoubtedly the most impressive example of voluntary association and of what one such body could achieve in the framework of colonial rule. Established by a handful of college students with no money of their own, it grew with some government support and some patronage from the community, but mostly on the strength of its own activities. These were all 'canon-building' activities: the aim, to establish shuddh Hindi as the public language of the region, to fill the bhandar of Hindi with suitable books, and to draw up a canon of the Hindi literary tradition.

Established at the time of the Hindi-Urdu controversy, the Sabha bore the mark of the exclusivist discourse of the time, as its view of the unbroken tradition of 'Hindi', inclusive of all literary and regional varieties, amply shows. According to one of the first statements of the Sabha, Hindi had existed since the 11th century, but its further progress was prevented by the Muslim invasion of India and the creation of Persian-mixed Hindi, i e, Urdu. Hindi's survival strength was evident in the fact that even Muslim rulers had patronised Hindi poetry, while Sanskrit

remained the most important language of prose.[19]

All the Sabha activities gave substance to this view: the compilation of a monumental dictionary, the search for and cataloguing of old Hindi manuscripts throughout north India, the critical editions of Hindi 'classics' and lesser-known historical manuscripts; the many series of 'suitable' books for adults, boys and girls; the distribution of endowed prizes; the large public library, a scholarly journal, lectures, etc. All contributed to the canon- and character-building vision. The pool of scholars these activities drew together effectively shaped the Hindi literary tradition as we know it now and spread the Sabha's normative view on language and literature through innumerable textbooks and anthologies.

It is interesting to note the Sabha's attitude toward the colonial government: it was one of co-operation and pressure (as representative of the 'Hindi community'). The Sabha's idiom of progress and scientific work was quite effective in securing government patronage, particularly thanks to the presence of pro-Hindi officers in the education department. In turn, official patronage and financial support enhanced the authority of the Sabha in the community and the literary sphere. It was this institutional and ostensibly 'neutral' patronage, with set rules and judging committees, that the Sabha started to reproduce with its annual lists of the best books and by awarding literary prizes. In this way the association became a seat of recognition and its active members became 'literary experts'. And when the first Hindi department was founded at Benares Hindu University, it was the scholars from the Sabha who were called to man it (Ramchandra Shukla, Bhagvan Din and the founder, Shyam Sundar Das). This new institutional position further enhanced their authority.

Education: Education was perhaps the most successful area of influence of Hindi intellectuals and it is remarkable how they were able to capture this key instrument in the transmission of culture already in colonial times. The teaching and textbooks of language and literature transmitted not only the canon developed by the literary associations, but also the social relations embedded in the 'shuddh' language that was chosen.

Hindi intellectuals were keenly aware of the importance of education both as an institutional and as a discursive space. By institutional space I mean here the space schools occupied and created: the often imposing building, the space for public interaction – for girls often the first one outside the home. Schools were often centres of local literary and political activity, visited by national leaders and leading poets, and the classroom allowed a space for politicisation outside the colonial curriculum. Schools hosted the institutional figure of the teacher and headmaster, both important professional avenues for Hindi intellectuals. They also created, through the students, an important section of the modern Hindi reading public. But education was also important as a discursive space: it was a way in which ideas and perceptions about society, modernity, culture and the 'difference' between India and the west were spelt out.

Thus colonial intellectuals, in Hindi as elsewhere, invested classroom practices with a grand national(ist) agenda: 'national education' – one standard for all – was to lift Indians out of their backward state to a rank equal to that of the most advanced countries in the world. According to Hindi intellectuals, Hindi had an 'advantage' over English here as it was ideally placed to spread modern ideas *and* Indian cultural identity. The textbook especially came to be seen as a primary tool to instil this common 'national' identity and feelings of duty towards the motherland. Practically, too, for lack of other reading material for both teachers and students, textbooks were the only books available for Hindi-medium education. And since Hindi literati became almost solely responsible for the production of Hindi textbooks, it is their choice of language and of materials that we find in the textbooks.

In them we find the same ambiguity in the discourse of Hindi: Hindi was flaunted as language of mass education (and the antithesis of English) but the Hindi actually used in textbooks was the polite 'high' language of literary journals like *Sarasvati*, from which textbooks and anthologies drew substantial material. Thus 'tadbhava' words (words of Sanskrit origin but phonetically modified through the ages) were systematically replaced by Sanskrit loanwords (given in bold below) and 'foreign' (i e, Perso-Arabic) words avoided as much as possible. The result was a peculiar language whose cultural and caste markers appear just below the surface:

> **रात्रि** होते ही सब **पशु** और **पक्षी विश्राम** करते हैं। हमको भी **अधिक रात्रि** गए तक जागना **उचित** नहीं है **अन्यथा प्रातःकाल** उठने में **विलम्ब** होगा और इससे अगले दिन **कार्य** में **बाधा** पड़ेगा। इसलिए **रात्रि** को दस बजे से **पूर्व** ही सो रहो।
>
> As soon as **night** descends all **animals** and **birds rest**. It is not proper for us to stay awake **too long** into the **night** either, **lest** the next day we **delay** getting up **in the morning** and our **activity** is **impeded**. Therefore go to sleep **before** ten o'clock **at night**.[20]

> सरस्वती भी **धन्य** है जो उनके **मुखकमल** के **सम्पर्क** का **सुख अनुभव** करती हुई ऐसे महात्मा के **प्रसन्न गंभीर मानस** में **राजहंसी** सी **वास** करती है।
> अकेली गंगा है। लम्बी चौड़ी वासनाओं का **निवास** उस स्थान में नहीं। आकाश पाताल को एक करनेवाले विचारों का वहाँ **प्रवेश** नहीं होता।
> ब्राह्मण लोग हिन्दु जाति के अगुआ हैं। इसमें कुछ संदेह नहीं कि बहुत से ब्राह्मणों ने पढ़ना-लिखना छोड़ दिया है। परन्तु यह समय की गति है। उनका प्रभुत्व ज्यों का त्यों बना है।
>
> The goddess Sarasvati is **fortunate,** for she **dwells** like a **swan** in the blissful and **profound lake** of the mind of such great souls and experiences the joy of being in **contact** with their **lotus-like faces.**
> The Ganges is unique. It has no place for great desires or passions; tumultuous thoughts cannot **enter** here.
> Brahmins are the leaders of the Hindu community; undoubtedly many of them have stopped studying, but this is a consequence of the times. Their authority is undiminished.[21]

In textbooks this language acquired a peculiar stamp of authority. The ability to use and translate from such language 'into your own' became the hallmark of proficiency in Hindi and a shorthand for proficiency at court. Learning Hindi became an exercise in translation (examination papers say – even now – 'say in your own words'). This choice of language for education had several important implications, cultural, social and political. Did the forced exercise in translation required by Hindi textbooks and examinations mean that the language spoken at home was 'wrong' (P Agraval). For one thing, as Krishna Kumar has argued, the tendency toward syntactic complexity and Sanskritised vocabulary "strengthened the reproductive role of education. Only children of upper-caste background could feel at home in a school culture where the language was so restrictive."[22] The reproduction of cultural values and social relations embedded in language could be quite apparent, as the second passage shows.

As Veena Naregal has argued, this educational 'samskara' was significant not only for those who acquired it (placing them in a continuum with, and yet in a subordinate position to, English). It was even more significant for those who were deprived of it, despite all the declarations of universal access to education. For now the lack of education and of its visible markers in terms of dress, language and manner came to mean exclusion from the liberal project of the colonial state, placing the subject instead at the receiving end of

the state's idiom of force (Kaviraj). Lack of education thus virtually amounted to a lack of political rights. It also meant exclusion from the Indian public sphere and the need for intermediaries who would translate, as in the case of Baldev's letter, the idiom of the jati and of the state into something more local and accessible.

The success in spreading shuddh Hindi through education was therefore dense with important and discriminatory consequences, during the nationalist movement and after independence. As Krishna Kumar has remarked, Hindi education became a 'secret door' through which cultural nationalism entered the colonial system, but it also imposed a rigid linguistic and cultural ideal – the public self-representation – that was to survive in independent India.

V
The 'Other' Hindi

The reality of mass illiteracy alone is enough to raise serious questions regarding the impact of both normative and critical attitudes in the Hindi public sphere: the journals and textbooks we have been talking about were part of the experience of a relatively limited section of north Indian society. If English was the cultural and political language of a thin upper crust, shuddh Hindi was the language of another elite. Still, the question needs to be asked: What was the impact?

Even a cursory look at the *Catalogues of Publications* recording systematically publications registered from 1867 onwards offers some interesting insights. If we take the volume of publications in Hindi as an index and take into account indicators such as price and print-runs, we see that throughout the period until 1940 semi-oral genres of religious and secular nature such as 'bhajan', *Ramayana* compilations, seasonal songs, 'ghazal', versions of the *Alha* epic, 'qissa' and 'samgit' form the great majority of publications. This attests not only to the continuing popularity of oral forms in print, but also a use of print beyond the pale of the normative project and largely indifferent to new literary tastes.

So, while texts of the courtly and devotional Braj Bhasha literary culture were upheld as classics in expurgated students' editions, erotic songs in Braj Bhasha and various versions of Khari Boli circulated widely in the market-place for a few annas. Educational books were the fastest-expanding branch of Hindi publications but as late as 1935 educational titles amounted to less than one-fifth of those of popular songs and dramas. Among new literary works, only those of overt nationalist sentiments normally went through more than one print-run. The picture that emerges is one divided between a relatively small readership for new literary works and journals, a substantial proportion acquiring through textbooks the necessary linguistic and literary samskara, and an overwhelming majority reading religious or entertaining publications in non-standard Hindi.[23]

Besides, the popular market shows also a more direct kind of public intervention to address the public beyond that of the highly literate few: I am talking here of pamphlets (in prose or verse) printed directly by the author in order to comment on topical issues, a growing phenomenon in the 1920s and 1930s. The Sharda Act, and especially the Civil Disobedience movement of 1930, had popular playwrights and printers, as well as private citizens, pouring their own views into print in the form of nationalist bhajan, kajli, alha, samgit, etc, in huge numbers of titles and copies. This trend supports the well-known fact of increasing mass politicisation, but it also suggests an important point for the Hindi public sphere.

Nationalism, and especially nationalism in its non-parliamentary, expansive form, was the jellying factor that brought the different sections of society together. The fact that nationalist poems appeared in all levels of the Hindi press and in textbooks and were acclaimed at poetry-meetings, that nationalist short stories were published and distributed like pamphlets (e g, Premchand's *Samar-yatra*, 1930), that popular poets and playwrights produced their own versions of topical events, and that local poets published nationalist allegories at their own expense all produced an overlap that gave a mistaken impression of unity. Poets and writers really believed that they were the seers, the vanguard of the whole society; journals believed they were the expression of public opinion in its entirety; critics and scholars believed that, despite the unruly crowds, their project would extend to all; and even marginal subjects believed they were equally members of the public of svarajya.

But the overlap and the picture of unity – still present in nationalist historiography – starts to show cracks and tensions when we pay enough attention to the mechanisms of cultural transmission and to the tensions arising even within the Hindi literary sphere – tensions that have to do with the conflict between normative and critical attitudes, with conflicts of authority, with the structural divisions within the reading public and so on.

VI
Epilogue

What did they mean by public? In the course of the article I have tried to discuss the various uses of public and to problematise the 'they', too. For, if the concept of public – whether jantaa sarvasadharan or jati – suggested an open-endedness, a unity and a principle of general validity that were not there before, it awakened different responses in the Hindi literati who wrote and thought about it. For some the open-endedness reminded them first of all of their duty, which was to lay down general principles and norms that would be valid and should be followed by all, and then do their best to try and enforce them with their unofficial authority. What they lay down was an ideal, a positive self-representation of the jati, and everything was evaluated according to these criteria and termed either 'Indian' or 'un-Indian'. For others, public meant writing off old rules and beliefs and treading new paths: where to was often not clear, but they were guided by a great faith in the intrinsic value of the process.

In the case of Hindi language and literature, the normative attitude had a more limited but continuous impact and held crucial nodes of transmission (e g, education). The critical attitude had greater momentum, was very important for certain subjects, and at times seemed overpowering but was ultimately divided and institutionally 'weak'. The success of constitutional politics after 1937 buttressed the success of the normative view of Hindi. The space left for critical and popular voices was marginal, and decreased after the movement was over. There was, to be sure, critical space left in journals, in the literary sphere (and in pockets of radical politics), but the impact on the general population was, we have seen, pretty limited.

Hindi, which had the potential of becoming the new unifying language of a new, more popular and inclusive understanding of the public, failed to do so. The ostensibly neutral, normative language that prevailed was an exclusivist language which embedded hierarchical social and caste relations. Does this 'failure' of the language reflect a larger failure at social integration despite the attainment of political democracy and a certain amount of social change and mobility? Even in post-independence India we find that critical (subaltern) voices could not determine the co-ordinates of the public in Hindi: caste, economic relations, patriarchy, personal

authority remained, until recently, outside the purview of public.

Even within the literary sphere, the normative attitude of professors and textbooks undercut the critical (and political) potential of literature and the independent authority of writers: an Italian proverb says that at night all cats are grey: in the classroom, writers lost their distinctive colours. This may explain the apparent paradox of a very imaginative, very critical and often very political literature and conversely a culturally conservative language and an establishment endlessly feeding on talks of 'Bhartiya samskriti'.

Is Import Liberalisation Hurting Domestic Industry and Employment?

R G Nambiar
B L Mungekar
G A Tadas

Theory says that freer trade encourages economic activity and hence raises production and employment. Is this true in the Indian case? This article examines statistical evidence to answer this question. It finds that since liberalisation, trade has shrunk India's manufacturing base both in terms of value addition and employment. The intermediate and capital goods industries have suffered more. Manufacturing is also shifting from high-skilled and capital intensive production to low-skilled and labour intensive production. Existing wage disparity between skilled and unskilled workers has worsened.

INDIAN corporate leaders have been sounding alarm bells over the alleged harmful effects of international competition. 'India for Indians first', 'we should have opened the Indian economy for Indian businessmen and then invited foreigners', 'strengthen Indian industry first, and then invite MNCs' are some of the typical comments appearing in dailies and weeklies. Many contend that they do not have a 'level playing field'. International players have superior technology and financial muscle; and they will destroy Indian manufacturing industry. India may eventually become a nation of farm products and services. Is this reasoning correct? Is international trade responsible for crippling India's manufacturing industry? What about other factors such as a decline in the share of manufactured products in consumer spending, presence of cyclical conditions both at home and abroad and changes in exchange rates. The choice of appropriate policies depends crucially on our ability to evaluate the relative impacts of these various factors. A full investigation of all these factors is not attempted here. The rate and pattern of India's industrial growth has been a subject of debate [Ahluwalia 1991; Chandrasekhar 1988; Kelkar and Kumar 1990; Nagaraj 1990; Nayyar 1994; Neogi and Ghosh 1998]. We decided to examine some of the more important empirical evidence that has a bearing on the trade-industry relationship. To that proximate goal, we began to assemble relevant source materials. Based on our initial exploration, some preliminary findings were reported in this weekly [Nambiar and Todas 1994]. However, this enquiry could not be extended to the 1990s because of paucity of relevant data. Having secured that information we now attempt a longer historical review.

The evidence, it is argued below, further confirms our earlier observation that trade is the root cause for crippling domestic industries. The worst hit is the capital goods or the machine-building industry. This industry has a crucial role to play in the industrialisation of any economy, and the speed and nature of its development are particularly important in an economy such as India. Viewed from this angle, the erosion of capital goods industry marks the erosion of India's industrial base.

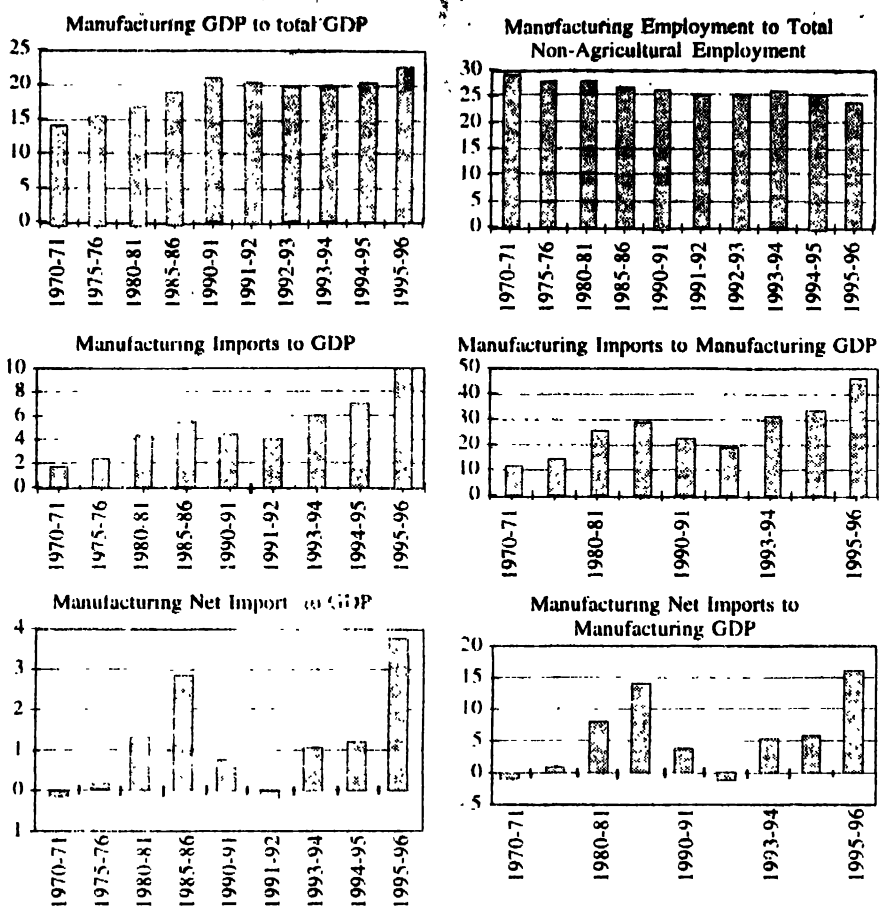
The plan of the article is as follows. In Section I we review some key macro-economic data to find whether there is a prima facie case of trade forcing a structural change in the Indian industry. Then in Section II, we provide the methodological framework and the data sources for quantifying the effects of trade. In Section III, we present our empirical results. Some evidence on the role of trade in wage inequalities is presented in Section IV. The last section summarises our findings.

I
Key Macro-Economic Indicators

The chart shows the periodic movements in key macro-economic indicators. In broad terms, the concern over trade competition originates from the confluence of several trends shown in the chart. First, observe the movements of the share of manufacturing GDP to total GDP. The indications are that the share of manufacturing GDP has remained almost constant over the past five years: 14 per cent in 1970-71 and 21 per cent in 1990-91. Since then there are no signs of recovery, except in 1995-96. Second, the relative decline of manufacturing sector is even more pronounced when viewed from the employment side than from the output side. Thus, the share of manufacturing in total non-agricultural employment fell from 29 per cent in 1970-71 to 24 per cent in 1995-96. The poor and declining labour absorption capacity of the Indian industry in general and of the manufacturing sector in parti-cular has received much attention in the literature [Ahluwalia 1991; Nagaraj 1994; World Bank 1989; Lucas 1988]. Third, manufactured imports record consistent rise. Its share in total GDP has moved up from 2 per cent in 1970-71 to 10 per cent in 1995-96. Instead, if one looks at the weight of manufacturing imports in manufacturing GDP, then the rise is from 13 to 45 per cent. Fourth, the rising import intensity of domestic manufacturing has had strong implications for India's trade balance. This can be seen from the net trade to GDP ratio. Thus, the proportion of net manufactured imports to total GDP (manufactured imports less manufactured exports) moved up from (-)0.1 per cent in 1970-71 to 3.7 per cent in 1995-96. This rise becomes more pronounced if we look at manufacturing imports as a proportion of manufacturing GDP. This latter indicator is seen to have moved up from (-)0.5 per cent in 1970-71 to 16.7 per cent in 1995-96.

Some more details on shifts in the structure of India's manufactures trade would be in order. The data is based on CSO (various years). Manufacturing sectors are classified by end-use categories (Appendix Table). From 1978-79 to 1989-90, India's manufacturing export basket contained nearly 50 per cent of intermediate and capital goods. Since 1991-92, however, consumer goods exports predominated India's manufactures exports, the proportion of which increased from 50.6 per cent in 1989-90 to 72.5 per cent in 1996-97 (Table 1). The share of intermediate goods in total manufacturing exports, on the other hand, declined from 38.5 per cent in 1989-90 to 12.6 per cent in 1996-97. On the import side, what one notices is growing predominance of capital goods. The proportion of capital goods in total manufacturing imports increased from 36.6 per cent in 1978-79 to a high of 62 per cent in 1996-97. Looking at another way of classification based

CHART. MANUFACTURING GDP, EMPLOYMENT, TRADE IN TOTAL GDP/EMPLOYMENT (PER CENT)



on production characteristics, it is of interest to note that the proportion of hi-tech and labour intensive manufactures in total manufacturing exports tended to increase between 1978-79 and 1996-97. The share of hi-tech exports increased from 13 per cent in 1978-79 to 31 per cent in 1991-92, which, however, fell to 25 per cent in 1996-97. The proportion of labour intensive exports in total manufactures exports increased from 9 per cent in 1978-79 to 13 per cent in 1991-92 and further to 34 per cent in 1996-97. The weightage of resource intensive exports in total manufacturing exports consequently declined from 68 per cent in 1978-79 to 37 per cent in 1996-97. Capital intensive exports also suffered a net loss in their relative weightage in total manufacturing exports between 1978-79 and 1996-97. On the import side, hi-tech imports witnessed significant shifts – their share in total manufacturing imports increased from 26 per cent in 1978-79 to 61 per cent in 1996-97.

Admittedly, these macro-economic trends could only furnish rough indicators of patterns of structural shifts in India's trade and industry. The key question is whether one can relate these various trends to each other, and in a systematic way. In what follows an attempt is made to correlate some of these shifts in certain quantitative terms.

II
Method, Data and Reference Period

Methodology: A separation of the effects on the economy of foreign trade and domestic forces begins with the identity:

$$P = U + X - M \qquad ...(1)$$

where P stands for production of goods; U, domestic use (consumption, government purchases, and investment including inventories); X, exports; and M, imports.

Using this identity and data on total production, exports and imports, any change in production can be decomposed into change due to domestic use and change due to foreign trade balance. But, to estimate the impact of a change in one of the right hand side variables, say exports or imports, on production of individual domestic industries, the induced effect of that change must be estimated. For instance, when a pair of footwear is exported, the induced effect of that change can be expected on a wide variety of other industries that supply inputs – leather, rubber, plastics, nails, glue, thread, fuel, electricity, transport, and so on. Similarly, when an import, say a machine replaces a domestic product, it reduces not only the activity of the concerned industry but also the activities of all these industries which supply inputs – steel, aluminium, copper, chemicals and so forth. In some cases, the induced effect even changes the allocation of total value added between domestic and foreign sources. For instance, an increase in the exports of machine tools will require an increase in imports of special steel as raw material, so that the net effect on total domestic production is less than the value of exports A complete accounting of the

Note: See Appendix Table for details on industry groupings.

impact of trade should therefore incorporate both the direct and indirect effects.

In order to capture this total effect, we use input-output table for India. As a first step, we calculate labour/output ratio (i e, labour requirements per one rupee worth of output) for each sector. Then, the direct and indirect labour requirements for domestic use, exports and imports are separately derived as follows:

$$LU = K\,(I - A)^{-1}\,U \qquad ...(2)$$

$$LE = K\,(I - A)^{-1}\,E \qquad ...(3)$$

$$LM = K\,(I - A)^{-1}\,M \qquad ...(4)$$

where K is a row vector of labour coefficients, $(I - A)^{-1}$ is the Leontief inverse, E is a column vector of exports, M is a column vector of imports, and U is a column vector of domestic use. LE is the direct and indirect employment associated with exports, LM is the employment displaced by the competing imports; and LU is the employment attributable to domestic use. In a similar fashion, estimates are made of the total value added in each industry that could be related to domestic use, exports, and imports.

Within the framework discussed above, estimates of the effect on value added and employment in the manufacturing sector that is attributable to trade and domestic use are made for 1978-79, 1983-84, 1989-90, 1991-92 and 1996-97. All values are at 1983-84 prices.

Data sources: The data needed for the study relate mainly to two things: (a) input-output transaction table which will give data relating to intermediate consumption, final consumption, gross output and value added, (b) employment data for calculating sectorwise labour-output ratios.

(a) Input-output tables for India are available for 1978-79, 1983-84, 1989-90 and 1991-92. Using these tables the estimates of net effects of trade on value added and employment are worked out for manufacturing sectors of the input-output transaction matrix. All the tables except for 1991-92 are drawn from the data base of Central Statistical Organisation [CSO various years]. The one for 1991-92 is supplied by the Technical Note to the Eighth Five-Year Plan, Perspective Planning Division, Planning Commission, and differ somewhat from the CSO table as far as the sectoral classification is concerned. At the time of writing no input-output table was available for a more recent year, say 1995-96, or 1996-97. At the same time, we wanted to include a more recent year to evaluate the impact of reforms. That meant reworking especially the final demand vector for a more recent year. Instead, we have used the Technical Note to the Eighth Five-Year Plan which gives sectorwise projections of final demand for 1996-97. Certainly, this error of using a projected data would be reflected here. But we doubt that the error component is large enough to alter the main findings.

(b) Employment data for ther manufacturing sector is taken from the *Annual Survey of Industries*, CSO; for agriculture from the *Census of India* for mining from Statistical Abstract of India, CSO; and for the service sector from Economic Survey, Ministry of Finance.

Reference Period: The reference period for the analysis is the period from the late 1970s to the year 1996-97 for which data was readily at hand. The period appears to be the most relevant sample for investigating the alleged bias of trade against native industry because this is roughly the time when India's policy-makers began to shift domestic economy from a highly regulated, inward-oriented regime to an open, outward-oriented regime. Initial steps in this direction were taken by both the Janata government (1977-80), and by the Congress government (1980-84). But it was from late 1984 that substantial changes started. Propelling these changes were two major campaigns. The first campaign started in 1984 when the late Rajiv Gandhi came to power. He pushed a series of domestic economic reforms – exemption of certain industries from MRTP system and raising of investment threshold for others, broadbanding of industrial licences, etc. The second campaign was initiated by P V Narasimha Rao in 1991, who pushed the reforms to the external sector. This latter campaign continues still as a defining feature of modern Indian economic policy. Now, given these radical changes in the Indian economy, enough experience has already accumulated to make it possible to assess the relative roles of trade and other factors in structural shifts in Indian industry.

Assumptions/Limitations: The following assumptions will be maintained throughout the article.

(1) The analysis assumes no change in input-output requirements over time and no substitution possibilities among inputs. This assumption is maintained because the input-output transaction matrix of 1983-84 is used for calculating the direct and indirect requirements for 1978-79, 1983-84 and 1988-89, and the matrix of 1991-92 is used for making estimates of both that year as well as 1996-97.

(2) It assumes that final demand always substitutes between particular imports and output of domestic industry which manufactures seemingly similar products rather than products of some other industry.

(3) It allows for no differences in productivity growth between exports and domestic use.

(4) This is an exercise with *ex post* data rather than a simulation with a full scale behavioural model. That is to say, these

estimates of the 'contributions' of each component, which in a definitional sense can be decomposed into exports, imports and domestic use, are not estimates of causality. It neither explains why the configurations occurred, nor accounts for possible behavioural interactions among endogenous variables.

Subject to several of these assumptions and their limitation, this exercise is a first step in providing an indication of the order of magnitude of the effects of trade *vis-a-vis* domestic use on value added and employment.

III
Data Analysis

The employment and value added due to trade and domestic use for manufacturing industries as a whole are displayed in Table 2. In 1978-79, value added related to manufacturing exports was 15.42 per cent of overall value added in manufacturing, while production of these goods at home would have raised value added in manufacturing by 15.12 per cent. The net value added was 0.30 per cent (Rs 740 million). In 1996-97, however, it was negative. Value added related to manufacturing export was 29.4 per cent of the overall value added in manufacturing, while the production of these goods at home would have raised value added by 35.4 per cent. Thus, for the period 1978-79 to 1996-97, trade cut value added in manufacturing by Rs 48,431 million, i e, roughly by 6 per cent. Trade also squeezed manufacturing employment. In 1978-79, trade provided a net addition of 3.1 lakh jobs in manufacturing. On the contrary, in the subsequent periods trade either rendered many jobless or, if at all, created fewer jobs.

A prevailing myth is that trade has aided industrial recovery in India. The evidence presented in the table shows that this recovery has been largely propelled by domestic demand. Thus, for the period 1978-79 to 1989-90, the net increase in manufacturing value added is 117 per cent (Rs 2,85,178 million). Decomposing this change into that attributable to trade and domestic use, we get (-)13 per cent (-)Rs 30,064 million attributable to trade, and 130 per cent (Rs 3,15,242 million) for domestic use. Alternatively, if we take the whole period, 1978-79 to 1996-97, the net increase in manufacturing value added is 230 per cent (Rs 5,61,575 million). This change when decomposed into that attributable to trade and domestic use, gives (-)22 per cent or (-)Rs 49,171 million, and 252 per cent (Rs 6,10,746 million) respectively.

The discussion so far has concentrated on manufacturing industry as a whole. It will be useful to look at each sector of manufacturing industry. To this end, we consider sectorwise calculations and some summary categories have been drawn from this exercise. One such summary category rests on end-use classification (Appendix Table). Based on this, Table 3 displays percentage shares of the three broad manufacturing categories in total manufacturing value added and employment (i e, total of both direct and indirect effects). The manufacturing activity in India has today come to be dominated by consumer goods. Between 1978-79 and 1996-97, the weight of this group is seen to have increased from 52 per cent to 77 per cent. The share of both intermediate and capital goods is seen to have dropped from 21 to 6 per cent and from 27 to 16 per cent, respectively. Second, the employment shift has also proceeded in the same fashion with the consumer goods industry emerging as the biggest employer providing 88 per cent of total manufacturing employment in 1996-97.

Table 4 breaks down the striking divergence of consumer goods from the rest of manufacturing into the parts accounted for by foreign trade and domestic use. Two important points emerge from the table. On the one hand, trade balance raised both value added and employment in consumer goods industry. Thus, between 1978-79 and 1996-97, value added in consumer goods industry recorded 390 per cent rise (Rs 4,95,488 million). Of this net increase, one-fourth (Rs 1,25,680 million) is attributable to trade, and the balance (Rs 3,69,808 million) attribut-

able to domestic use. Conversely, trade reversed the growth path of both intermediate and capital goods. To illustrate, the value added in the capital goods industry increased by 110 per cent (Rs 70,904 million) between 1978-79 and 1996-97. This net value is obtained by adding Rs 1,96,761 million (denoting an increase of 274 per cent) attributable to domestic use and (-)Rs 1,25,857 million (a decline by 164 per cent) attributable to trade balance. What emerges clearly is that trade set in motion a restructuring process by fuelling consumer goods production, and freezing the production of both capital and intermediate goods. This is worrisome because the capital goods or the machine-building industry has a crucial role to play in the industrialisation of any economy, and the speed and nature of its development are particularly important in an economy such as India. A productive system is a set of articulated elements, whose coherence results from the subordination of each one of the disparate parts to the logic of the whole. This coherence can come from the logic of the market place, or from planning. Generally, both these forms of co-ordination are combined in all modern capitalist economies.

While it is undoubtedly possible to formulate more detailed classifications, two broad avenues can be considered. The first is aggregation according to the nature of production process, and the second is according to skill intensity.

Production process: In trade literature, it is customary to classify goods into three groups: goods requiring relatively intensive use of natural resources (called Ricardo goods), goods that require high proportion of research and development (high-tech goods), and goods that use relatively standardised production technologies (called Heckscher-Ohlin goods). For our purpose here, we adopt the resource intensive and high-technology groupings, and divide the Heckscher-Ohlin group according to relative capital-labour ratios into capital and labour intensive categories (Appendix Table).

The processwise grouping of Indian industries exhibits features (Tables 5 and 6) which are similar to the end-use classification. A major structural change that is visible is the long-run shift away from the production of capital intensive goods towards the production of resource intensive goods. Thus, in the period from 1978-79 to 1996-97, the weight of capital intensive industries in both manufacturing value added and employment has dropped (Table 5). Further, the share of hi-tech industries in manufacturing value added stagnated during the period; in fact, in manufacturing employment its share has considerably declined. Only in the case of resource intensive industries the share is constantly seen rising both in terms of manufacturing value added and employment. In the case of labour intensive industries, the share in value added increased, while the share in employment declined.

Thus, value added and employment gained by trade are mainly those of resource intensive industries, whereas in the rest of manufacturing, trade balance has cut both value added and employment (Table 6). Imports are responsible for about 36 per cent of the output loss in the hi-tech industry and about 163 per cent of output loss in the capital intensive industries between 1978-79 and 1996-97. Against these losses, the benefits rendered

by trade are a marginal gain of 9 per cent in the value added of resource intensive industries, thanks to the powerful offsetting force of domestic demand. Thus, in the case of hi-tech industries, while trade lowered output by 113 per cent between 1978-79 and 1996-97, domestic use lifted output by 355 per cent; and so the net effect was a 242 per cent rise in output. Again, in the case of capital intensive industries, the negative effect of trade was more than offset by positive effects of domestic use Thus, the patterns associated with the performance of Indian manufacturing industries are all present in the data on trade and domestic use – considerably more rapid gains in resource intensive industries, a relatively slower growth in all major process and end-use categories, particularly hi-tech and capital intensive industries.

Skill-intensity: We classify the manufacturing sectors of the input-output table into three broad groups: (a) high skill-intensive sectors, (b) medium skill-intensive sectors, and (c) low-skill intensive sectors. Our procedure for making this classification can be illustrated as follows. *The Annual Survey of Industries* (ASI) supplies information pertaining to number of workers, and total persons engaged in each industry at 3- and 4-digit industrial classification. The term 'workers' as per ASI definition includes all persons employed in the production process, i e, persons employed in any manufacturing process or in cleaning any part of the machinery or in any other kind of work incidental to manufacturing process. The production process workers are therefore taken here as a proxy for unskilled labour employed. There is no separate heading for skilled labour. All that the ASI gives is 'total persons engaged', which includes besides workers, all administrative, executive, technical, clerical and sales workers. Therefore, we subtracted the category 'workers' from the category 'total persons engaged' to obtain the managerial and technical staff employed in each of the industry. This latter figure is taken as the nearest proxy for skilled labour. Using this pairwise data, the ratio of skilled to unskilled for input-output sectors were computed. This ratio ranged from 0.74 in electronics to 0.09 in jute textiles. In the next step we used a 0.20 point frequency range to classify the sectors into high, medium and low skill-intensive sectors. Accordingly, sectors with a skill-intensity ratio in the range of 0.74 to 0.54 were categorised as high skill-intensive sectors; from 0.33 to 0.53 as medium skill-intensive sectors; and from 0.33 and below that as low skill-intensive sectors. The classification is intended to be illustrative. One could adopt more rigorous standards of classification (Appendix Table).

What does this skillwise classification tell us? Typically, the change that is visible is the long-run structural shift away from the production of high skill-intensive goods to production of low skill-intensive products. This can be seen from the figures arranged in Table 7. Notice for instance the rise in the share of low skilled segment in both value added and employment – from 36 per cent to 60 per cent for value added between 1978-79 and 1996-97, and from 37 to 82 per cent for employment – and a corresponding fall in the shares of both high skill-intensive and medium skill-intensive segments of industry.

Again, Table 8 breaks down the total change into the parts accounted for by foreign trade and domestic use. It may be noted that output and employment gained by trade are all in low skill-intensive sectors, whereas in both high skill-intensive and medium skill-intensive sectors trade diminished both output and employment.

IV
Trade and Wages

What effect has freer trade had on the gap between skilled and unskilled workers' pay? Going by the theoretical construct, known as Stolper-Samuelson theo-

rem [Stolper and Samuelson 1941], one should expect free trade to reduce the wage gap. Why? The argument is simple. India has plenty of unskilled labour. Therefore, India's exports will be more intensive in the use of unskilled labour. Liberal trade causes exports of these unskilled labour-intensive products to rise. Hence, wages of unskilled labour will have a tendency to rise, and at the same time wages of skilled labour will have a tendency to fall. The opposite is predicted for rich countries whose abundant factor is skilled labour. In short, the theory predicts that whatever sort of labour is the most abundant in the country before liberalisation, is the one that prospers the most as a result of trade.

The reality however rebels against this neat geometry. Several studies of individual countries and regions have shown that trade has in fact widened the wage gap, both in poor as well as rich countries. For instance, in Chile, Columbia, Costa Rica and Mexico, tariff rates have been brought down from 45 per cent in 1985 to 13 per cent in the recent years; nonetheless, wage disparities are noticed to be increasing [Robins 1996]. Similarly, evidence of increasing pay differentials between skilled and unskilled workers in Thailand and Philippines are reported. What makes these findings intriguing is that they all, besides refuting Stolper-Samuelson theorem, tend to say that trade hurts the poor more than the rich.

What do the available facts tell us about the Indian experience? To test this hypothesis, we have worked out average yearly wages for skilled and unskilled workers in India for the period 1980-81 to 1992-93. The data arranged in Table 9 highlight two points. First, unskilled workers have generally tended to receive half the pay of that for skilled workers. Second, wage differentials between the skilled and unskilled have in fact tended to widen, but of course marginally. These results are further confirmed by the patterns in wage disparities across sectors grouped according to revealed skill intensity. This is shown in Table 10. Thus, as we move from low skill-intensive sectors to high skill-intensive sectors, one finds the wage levels rising, almost doubling. Thus, one may say that the Indian experience in regard to the effect of freer trade on wages is not supportive of Stolper-Samuelson theorem; on the contrary, the available facts tell us that freer trade has, if at all, benefited skilled labour more than unskilled labour. These results are indeed intriguing given the fact that the net effect of trade has been to increase the weight of value added in

low skill-intensive segments of manufacturing as seen earlier.

V
Concluding Observations

Trade has over the years shrunk India's manufacturing base, both in terms of value addition and employment. There is a distinct irony here. Traditional classical theory argues in favour of free trade; yet, in the Indian case, its role has been more of deprivation than providing a stimulus to growth.

The adverse impact of import liberalisation is more pronounced on intermediate and capital goods industries than on the consumer goods industries. Again, between the two affected categories the capital goods sector is worst hit. Since the intermediate and capital goods industries have relatively large income and employment generating linkages, their erosion would have a direct negative effect on value added and employment. Further, their erosion also implies the erosion of India's industrial base.

Inconsistent with the dynamics of economic growth, India is emerging as a producer of resource-intensive goods rather than the hi-tech and capital goods. This has led to a progressive and sustained decline in the share of hi-tech and capital-intensive goods in total manufacturing value added and employment. This is certainly not a desirable scenario.

High-skilled workforce in the manufacturing sector claims a relatively larger share in the manufacturing wage-bill at the cost of semi-skilled/unskilled workers. Among other things, this is widening the existing high wage disparity.

Lastly, like most of the debate on economic reforms, economists, policy-makers and industry associations in India are sharply divided on the desirability and pace of import liberalisation. We, however, tend to argue that with respect to import 'iberalisation 'yes' or 'no' positions are equally damaging. There is no denying the fact that India's pre-1991 industrial policy, was unduly protectionist more so prior to 1980s. Though such policy, among other things, helped the country to lay a sound industrial base, it cannot be disputed that it created a sheltered market for Indian industries, exempted them from foreign competition, brought a sense of complacence and ultimately resulted in 'high cost' and 'poor quality' industrialisation. This 'high protection-high cost-poor quality' syndrome needed to be corrected by import liberalisation. But the important question is about the nature and pace of import liberalisation and the areas of import liberalisation. This calls for a strategic approach towards trade and industrial policy to secure a sustained increase in industrial output and employment as also to protect India's industrial base without sacrificing efficiency.

[This is a slightly revised version of a paper presented at the Platinum Jubilee Seminar on 'Current Industrial Policy and Performance in India' organised by the Centre of Advanced Study in Economics, Department of Economics, University of Mumbai, March 24, 1998. The authors would like to thank the participants at the Seminar for their very useful comments on the paper. The authors alone are responsible for errors and omissions, if any, and the views expressed are theirs and not of the organisations to which they belong.]

Emergence of Backward Castes in South Telengana

Agrarian Change and Grass Roots Politics

Anil Kumar Vaddiraju

Studies of two villages from Telengana, Andhra Pradesh, tell us a story of the emergence of backward castes in local politics. These unirrigated villages have not seen green revolution or any improvement in agricultural technology, which has prevented the strengthening of earlier class/caste power structure. It has allowed backward castes to improve their position socially and also in landownership.

THIS article deals with two village studies from the unirrigated part of Nalgonda district, Telengana, Andhra Pradesh. Much of the Nalgonda district – like much of the rest of Telengana – is unirrigated and drought-prone. This article studies changes in landownership as well as grass roots political power in this region.

It is argued that absence of green revolution and rapid development of the productive forces such as irrigation is the main reason why the dominant castes could not strengthen their hold between 1960-96. On the other hand the backward castes and lower castes emerged to take political power for precisely the same reason. The recently introduced electoral reservations following the 73rd constitutional amendment also strengthened the backward and lower caste claims to power. Thus both structural as well as political tendencies worked in favour of the emergence of backward castes at the grass roots (village and mandal) level.

This trend towards the emergence of the backward castes however is a nascent one and is limited to grass roots level only. This article argues that the further consolidation of backward and lower caste struggle for power needs another round of land reform which would reduce the unequal power held not only by upper castes but also by some backward castes.

While making the above broad point, it is also argued that (a) emergence of the backward castes is only partly state-induced but it is influenced by larger forces and is partly a historical process; (b) that the upper caste semi-feudal class in the region investigated faces dilemma about its reproduction; and (c) that the dilemma of the semi-feudal class, which is confronted with challenges from below, is its larger historical dilemma.

In Section I we present these arguments for Ramannapet Mandal. Section II and III present two village studies.

I
Ramannapet Mandal

Backward Caste Peasantry

The emergence of backward castes took place in nearly all the villages of the mandal roughly since 1970. Since then they have consolidated their position. This process was two-pronged. At the political level the backward castes challenged the authority of upper castes – mainly reddys; and succeeded to a large extent. At the economic level they challenged semi-feudal practices. Practices such as 'vetti' have completely disappeared. Now labour relations are almost entirely on the basis of free wage labour. The researcher could not find unfree labour or extra-economic coercion anywhere in the two village studies.

Commercialisation of the village political economy has also not led to the process of creation of 'capitalist landlords', who combine traditional caste power with modern economic power, for two reasons. First, there has been no drastic development of infrastructural facilities or productive forces such as irrigation canals, etc. Second, there were other pressing social reasons such as heavy dowries for upper caste endogamous marriages and division of landholdings among heirs. This led to decline of landlords economically, socially and politically.

At the political plane the periodic panchayati raj elections with reservations for OBCs and women have contributed much to the forming of caste solidarity among backward castes challenging upper castes. The emergence of backward castes was confirmed by the fact that in the June 1995 gram panchayat elections 14 out of 20 villages in the Ramannapet mandal elected backward caste sarpanches; five elected scheduled caste sarpanches (together making it 19) and only one village elected a forward caste candidate to a seat reserved for women. Thus by 1995, 19 out of 20 villages were under the political control of backward and scheduled castes. This was partly due to state intervention such as enforcement of panchayati raj and reservations partly due to autonomous lower caste development. The process was partly state-induced and partly historical.

Finally, was there a proletarianisation/polarisation process in the field area? The answer is no. The process observed was deconcentration of big landholdings and strengthening of small and middle holdings and thereby the backward caste peasants.

In the village Bogaram the land passed from gampala reddy families to padmashalis, and particularly to the master weavers. Though there is substantive land concentration still in the village and another round of land reform is necessary, it is much lower that till 1970. More importantly small and middle peasants were not reduced to agricultural labourers. The export-oriented, multilayered handloom industry has absorbed some agricultural labour.

In the village Janampally, the process of deconcentration is even more clear. The brahmin landlords sold lands after family partition and later owing to unmanageability. This land was bought by backward castes: weavers, yadavas and toddy tappers. In this village the 'vatandari' power structure was already in the hands of yadavas and later they further strengthened their position.

Semi-Feudal Class

The semi-feudal class consists of upper caste landlords in the region. In the field area they come from the reddy and brahmin castes. It will be shown that their economic, social and political importance has declined owing to the emergence of backward castes. But we have also noted that the state could not carry out thorough-going land reforms and these semi-feudal classes still command some economic power though declining. But why such decline? Why does economic growth not benefit these classes more than it does the other classes?

Political economists like Utsa Patnaik have argued that after the green revolution the traditional semi-feudal landlords have become capitalist landlords. But we have noted that such a phenomenon did not take place in the field area. This is owing to a combination of reasons. The historical dilemma of the semi-feudal classes is that either they modernise and compete with the emerging classes, castes (such as padmashalis and yadavas in our case), or they decline under the pressures created by the larger polity, economy and society. In our field area the semi-feudal classes started to decline because they could not modernise – by modernisation we mean modernisation of productive forces – and thereby strengthen their economic position. The state has also not strengthened the productive forces by improving the infrastructural facilities such as irrigation and canals. The physical conditions of economic production have not changed much over the last 30 years. In these conditions the semi-feudal class could neither accumulate much capital nor re-invest existing capital. This is the reason why the reddy and brahmin landlords could not become affluent capitalist landlords. This also explains why the phenomenon of capitalist landlordism is more pertinent to green revolution areas than to non-green revolution areas. (It may be noted that Utsa Patnaik draws her conclusions largely from studies done in green revolution areas, particularly Haryana.)

Thus the semi-feudal class in the study area had either to modernise – which it could not – or decline. As noted earlier the social pressures within these castes, such as heavy dowries during marriages and partitioning of family lands have contributed further to the decline of these classes/castes. The pressure to get the younger generation educated and placed in urban employment was added to this. Many landlords spoke with great anxiety about the difficulty of getting their sons and daughters educated and employed. So did the youth belonging to the landlord families for many of them have graduate or postgraduate degrees but no jobs.

How do landlords ensure their survival? How do they ensure their reproduction? First, they make use of whatever 'free' labour is available. Second, they too make use of whatever advances have taken place in productive forces – electric pumpsets and tractors.

It is by both making use of the capitalistic labour relations as well as the modest advances in productive forces that the landlords of the erstwhile semi-feudal class ensure their reproduction. For the backward castes family labour and the traditional caste occupation are great strengths in ensuring reproduction. These arguments are illustrated in the two case studies below.

II
Bogaram Village

The red soils Bogaram village are not richly fertile and cannot yield lucrative commercial crops. Bogaram has 1,500 acres of land, of which total irrigated land is about 400 acres. It is all well-irrigated. During droughts irrigated area goes down to 100 acres.

More importantly the area does not have any traditional irrigation system. There are no canals. The village does not even have a tank. Whatever irrigation there was, and is, depends on rains or more importantly on wells. Oral historical accounts tell us that well irrigation always played a prominent part in the village economy, and continues to do so even now.

The principal crops grown in the past, and to a large extent at present, are paddy, groundnut, castor and millets. Of these groundnut and castor are commercial crops. Paddy, which is the most important of all crops grown, is both a commercial and a subsistence crop.

Historical Background

From 1900 to 1950, the village Bogaram was the jagir of Gulam Mohammed Khan, granted by the nizam. The Gulam Mohammed Khan and his family lived in Hyderabad. But his control of the village was total. He had the right to the entire land revenue and had substantial landholdings. These lands were cultivated through the system of 'vetti' or labour service.

The ruler showed no interest whatsoever in the development of the village. He and his ancestors were primarily interested in the land revenue and the product from their personally owned lands. They left the village largely to the vicissitudes of nature. Chronic drought, at times near famine conditions, prevailed. Failure of crops, inability to remit land revenue in time, were usual features of the condition of the peasantry. This as we see below led to the evolution and shaping of the agrarian structure in the village in the succeeding period.

As the 'dora' (landlord) of the village Gulam Mohammed Khan performed three functions: (a) collection of the land revenue, (b) collection of various taxes, and (c) general village administration. This included law and order administration. As an absentee landlord and according to the administrative system of the nizam, i e, the 'vatandari' system, Gulam Mohammed Khan appointed, on hereditary basis, three village officers. He ruled through these village officers. They were the 'patwari' (or a brahmin karnam); a 'mali patel' (reddy); and a 'police patel' (reddy).

It is during these 50 years that a single reddy family accumulated about 1,000 acres of land; its members acting as the village officers of Gulam Mohammed Khan. The 'patwari' or karnam (a brahmin) acting as the revenue officer accumulated about 200 acres of land. The method was often simple. Whenever a peasant could not pay the land revenue owing to drought, or some other misfortune, that land was transferred, in the records, into the account of either of the village officers. Oral accounts inform us that exorbitant taxes of the dora were often the other reason why land shifted into the hands of the patels. The reddy patels would pay the dora the taxes of those who could not pay and then take control of the land of that taxpayer. Thus one family, the gampala reddys, acting as village officers accumulated around 1,000 acres of land (which was later partitioned among five brothers).

Caste was no hindrance to this predatory process. Often fellow caste members were also victims. But it was mostly the other backward castes and untouchable castes who bore this burden. As is well known through any study of Telengana of this period the domination of the patels (and of the doras) was not just economic, but was also social and political. Landownership operated as the objective basis of socio-economic and political oppression.

The other prominent castes of Bogaram village the padmashalis (weavers), the toddy tappers, the yadavas (in that order) were prominent neither economically nor politically during this period. As is well known the system of free labour service ('vetti') to the local lords, i e, the patels encompassed all. But one must take care to add here that even during this period the padmashalis (weavers) were relatively free from its effects. Numerically predominant in the village as they were, weavers retained some relative autonomy from the system of oppression. Even so they did not possess any land whatsoever. Nor could they make much out of their caste occupation during this period. Weaving became profitable much later.

The end of the dominance of the jagirdar came with one, the larger political struggle of the Telengana movement; and two, owing the abolition of zamindari by the central government. But Gulam Mohammed Khan did not relinquish his landed

interests easily, Whatever was left by him was taken over by his erstwhile village officers. In the struggles that followed one patel was shot dead by the 'razaakars'. Eventually, the struggle ended in favour of the local reddy patels, particularly the gampala family of reddys. And the influence of pateldom continued. Land continued to be concentrated in the hands of five gampala reddy brothers. With the solidarity of fellow caste members they continued to dominate village affairs.

Not all reddy patels in Bogaram village were big landlords. By 1950 more than 50 per cent of the reddys owned landholding of less than 25 acres. And often the land they owned was not productive. The absolute productivities of even big landholdings were dismal. It may be remembered here that in pre-green revolution period no Borlaug-packages were available. But what is important to note is that neither class differentiation nor low level of absolute standards of living affected caste solidarity. Considerable number of reddy families were self-cultivating but when it came to social relations with the other lower caste families, they were certainly discriminatory or semi-feudal. There was a strong element of dominance at the superstructural level even when it did not exist at the economic level.

Pateldom, 1950-75

The period between 1950 and 1975 was a period of the continuance of the traditional patron-client relations. Though the dora Gulam Mohammed Khan was dispensed with, the gampala patels continued to rule the village. In this the mobilisation of caste solidarity was quite important. The first gram panchayat elections were held after the formation of Andhra Pradesh state, in 1959. In these elections Gampala Ram Reddy was elected as sarpanch of the village. He continued as village sarpanch for another term. Thus the single gampala family continued to dominate, *de jure* from 1959 to 1970. And de facto till roughly around 1975. In this period, and till today, the gampala reddy family was, and is, associated with the Congress Party.

The productive forces of the village were not much developed during this period. The land was concentrated in the hands of patel reddy families. And the nature of productive forces supported this social structure. We can take irrigation for example. The entire village depended to a large extent on well irrigation. This means that in a period during which there was no electricity, it was the big landowners who took advantage of whatever technology that was available. The oil engines which were used to pump water were within the means of big landholders only. Family farms and small holders certainly could not afford oil engines. The small peasants had to rely on 'mota bavis', a moat worked by oxen.

There was little or no state intervention to augment productive force. Electricity came to the village in 1982. State intervention even in other rural development programmes was minimal during this period. The gram panchayat sarpanches wielded political power, often backed by social domination, but they lacked public, governmental funds of any kind.

During this period the gampala reddy families, as headmen, arbitrated the village affairs and, quite importantly, the village disputes. Besides this they managed their own substantially big farms through, what appears to be semi-feudal labour relations. Vetti of the untouchable castes in particular seems to have continued, in however feeble form, till 1970.

Backward castes/classes in the village, though numerically preponderant, were not politically assertive during 1959-70. First, they were divided along caste lines. Secondly, the socially dominant and numerically important among them, the weavers, lacked economic power. During this period the weavers were only weaving cotton/handloom cloth for the local market which was not lucrative. The handloom industry had not yet found a world market. We will argue below how the globalisation of handloom industry led to the creation of a class structure among the weavers which in turn led to their political assertion.

But we should hasten to add here that the assertion of the backward castes took place much before the political ascendance of the weaving caste. The political assertion of the backward castes occurred basically against the gampala reddys.

Backward Castes, 1975-95

The first sarpanch Gampala Ram Reddy worked from 1959 to 1970. The de facto domination of the gampala reddy family continued till 1975. But the emergence of backward castes took place prior to 1975 In 1970 pachayati raj elections, all the backward castes worked against the vatandari gampala families. A toddy tapper was elected as sarpanch and continued in the post till 1981.

The weavers in the village were a numerous and politically important caste. But they were united against vatandari reddys. Weaving till 1980 was only meant for the local market. The raw materials yarn, chemicals, etc, used to be brought from Hyderabad and finished cloth used to be again marketed in Hyderabad. During the tenure of the toddy tapper sarpanch the most significant achievement was village electrification. This meant that even small peasants could buy pumpsets for their wells. This in turn meant that the backward class small peasants could strengthen their family farms. Interestingly during this period, from 1975 till as late as 1988, the party configurations did not change much. Both the vatandari gampala reddys and the backward caste leaders fought each other as different factions of the same Congress Party. The weaver caste which independently asserted itself in politics later was also a part of the Congress Party

Weaving and World Market

By 1980, the occupation of weaving became a lucrative one. The local weavers started sending their cloth to metropolitan cities such as Bombay, Delhi and Madras. The premium quality cotton cloth they produced was being exported from these metropolitan cities to America, Europe and Eurasia. Some cloth was also exported to Asian markets such as Japan. Along with cotton cloth of high quality they also produced silk cloth and saris. This process of internationalisation was complex and has produced a class structure among the weavers.

This is at first reflected in the emergence of master weavers and then to a stratification among the weavers. Firstly, the enterprising among the weavers started bringing in the raw materials and distributing among the middle-working weavers. The middle-working weaver in his turn employed a worker-weaver from any labouring caste of the village. The work was divided up as follows: master weaver – distributes raw material and markets the finished cloth; middle-working weaver – applies colours, dye, etc, and hires labour; and wage-worker weaver – weaves the cloth on either daily wage basis or piece rate basis. This structure worked, and still works, in favour of the first category of master weavers. The second and third category of weavers do not get more than their daily wage. This wage fluctuates with the fluctuating prices of finished cloth in the world market. What this system produced between 1980 to roughly about 1990 is an affluent master weaver class which also started asserting its dominance over not only the weaver caste, but over all the backward castes.

The affluence of the master weavers is visible in their houses. They own modern trucks, scooters, refrigerators, air coolers, etc, and a phone is also to be found in the

house of every master weaver to facilitate his communications with the local and metropolitan businessmen. None of these consumer durables are found either in reddy caste houses or in the houses of lower caste weavers. The standard of living indicated by these consumer durables is very high by local standards.

More importantly the master weavers started investing their money into buying lands, mainly from the reddys and sometimes also from other backward castes. Thus one master weaver who combines his government job with his master weaving activity has accumulated more than 100 acres of land. He is now one of the two big landlords of the village.

The deconcentration of land among the dominant reddy families appears to have taken place owing to two important reasons. First, land partition among family members; second, increasing cash dowries during marriages. Dowries in reddy caste often run into lakhs of rupees. This is one important reason for the sale of lands by reddys.

The weavers of the village are also organised into a co-operative society. Elections do take place for the society. But the entire society is dominated by master weavers. During the elections for the co-operative society money, liquor, etc, are lavishly used. The master weavers literally invest in these elections and in turn later use the co-operative society for furthering their business interests. In these elections weavers do fight among themselves on party basis. The master weavers were united under Congress Party and presently they are under the Telugu Desam Party.

Though the weavers are divided by class, when it comes to panchayati raj elections, they mobilise caste solidarity for electoral purpose. But even during the panchayat elections it is the handful of master weavers who dominate their fellow caste members. Since master weavers are engaged in the circulation of raw materials and marketing the finished product, they enter into patron-client relations with the other lower caste weavers. These patron-client relations help them in mobilising caste solidarity. Thus on its face it appears as if all the weavers belong to the same class and represent the same interests; but in reality they are divided into classes and contain inter-class exploitative relations.

In 1981 elections the master weavers asserted their political power. This time one master weaver got elected as sarpanch on Congress ticket defeating the toddy tapper candidate belonging to the rival faction of the Congress Party. It is clear that by this time though the vatandari gampala reddys in the village were supporting Congress Party they had lost their place in the political scenario of the village. Certainly, a decisive shift took place on the social basis of political power from reddys to that of backward castes; and within the backward castes in favour of the master weavers.

In 1988 gram panchayat elections, the earlier sarpanch and master weaver changed over to Telugu Desam Party and mobilised his caste as well. Thus the anti-reddy feeling has also turned into anti-Congress politics. One can see the photographs of Congress leaders hanging on the walls in the houses of gampala reddy family but not in the houses of any backward caste villagers. Thus presently the backward castes are organised under the master weavers supporting the Telugu Desam Party.

Liberalisation and Weaving

For weaving things have changed since roughly about 1990. Prices of yarn, chemicals and other raw materials have doubled, while the price of the cloth exported has remained unchanged. The burden is transferred by the master weavers to the two lower rungs of weavers. This is done by cutting down the wage rates and/or piece rates. Thus it is the wage-workers who bear the burden of internationalisation.

Besides weaving and agriculture, the master weavers engage in moneylending. The money made out of weaving, agriculture and moneylending is now being invested in urban properties. For example, a master weaver and earlier sarpanch has properties in Hyderabad and has his son studying engineering in the US and he is himself active in district level politics. During 1970-90 the backward castes have consolidated their position economically and politically. Though a caveat is necessary here that there is a class structure within the backward castes.

Caste or Class

In this village study it is observed that a shift took place on the social basis of political power from upper castes to backward castes. But this shift took place only between the top layer of reddys to the top layer or upper class backward castes. State involvement was only by way of holding the gram panchayat elections. No decisive economic programme, such as land reforms, has been carried out by the state. The changes in the agrarian structure have come about owing to the commercialisation process on the one hand and on the other owing to the incorporation of the village political economy into the world market. The social relations have definitely changed from semi-feudal to capitalist. Vetti or such practices are totally absent now. The traditional vatandar reddy families have declined in political and social importance though they still hold some economic power.

III
Janampally Village

Historical Background

Janampally was a khalsa village in 1900. The nizam had three types of ruling systems: jagirdari, khalsa and sarf-e-khas systems. In the jagirdari system the jagirdar owned much or all the land of the village. In sarf-e-khas system the entire land was owned directly by the nizam's family and the land revenue went to their personal expenditure. In khalsa system, the land ownership rested with the villagers. It was much like the ryatwari system of the presidency areas under the British. The significant difference with the other two land systems was that the villagers owned the land in their names and the land revenue went neither to any individual jagirdar nor to the nizam but to the treasury of the nizam government.

Village administration in all three types of land systems was run through the vatandari system. It meant a system of village officers who consisted of the vatan these were the patwari, the mali patel and the kotval or police patel. Janampally by 1990 had vatandari system. Under the system the patwari or village revenue officer belonged to a brahmin-karanam on hereditary basis. The mali patel and police patel posts belonged to a reddy family which lived away from the village. By 1990 the mali patel and police patel vatans were transferred into the hands of local yadavas, regionally called the gollas. The yadavas' basic occupation is sheep grazing. But one family, the meda family of yadavas, accepted the vatans. While the brahmin-karanam family ran revenue matters, other matters concerning village administration were run by the meda family of yadavas. Thus in this village, backward caste leadership has existed for 95 years. Unlike in the case of Bogaram village, it cannot be said in Janampally that the backward classes, emerged in village politics at a particular time after independence.

In order to run the village administration the yadavas educated themselves to some extent. But this is only true of the meda family of yadavas. The rest of the yadavas continued to be illiterate and backward

Though the mali patel and police patel posts were held by the yadavas it is the brahmin-karanam and his family which dominated village politics from 1900 to as late as 1970. In this village there is no significant evidence that the vatandari families accumulated land during the nizam period under consideration, i e, 1900-50. Two reasons appear to be important for this: first, ownership of land existed in the name of the villagers, and second, the karanam patwari was himself a progressive man who participated in the struggles against nizam rule as a Congress Party worker under the umbrella of Andhra Maha Sabha. He even participated in armed struggle against the nizam. Thus unlike in Bogaram village the village officers did not resort to accumulation of lands or encroachment on lands.

The khalsa system itself allowed less room for accumulation of land by village officers. There was less arbitrariness in the land related accounts. This meant that in the Janampally village the possibilities of accumulation of land by village officers were much less than in the village Bogaram. Another reason for this was the village productive forces. The productive forces of Janampally village are better situated than that of Bogaram village. The village has 1,200 acres of land and a big tank and four small tanks. Both tank irrigation and well irrigation played important role in somewhat stable and assured subsistence for small peasants. Thus the politically progressive nature of local elites and better productive forces worked against the concentration of land in the hands of a few village officers. Thus in this village the agricultural scenario is characterised by the preponderance of the small peasants. Another important reason for the relative absence of much feudal or semi-feudal dominance is that village did not have dominant caste dora. Though there were some reddys in the village they were not the village officers and therefore their economic power was neutralised by the political power of the backward castes and therefore whatever upper caste domination existed in the village was that of the brahmin-karanam. But the progressive and politically active nature of this village officer also diluted the semi-feudal content of the social dominance. Thus the brahmin-karanam family had about 75 acres of land. They continued to dominate the village affairs partly from 1990 to 1970.

Brahmin Dominance 1900-70

It was difficult to obtain much details about the period from 1990 to 1970 regarding social relations or political dynamics. It became clear that owing to the absence of the dora from the village scene semi-feudal practices like the vetti were not prominent. The upper caste domination was also unnoticeable because of the fact that the two village officer posts were in the hands of local yadavas.

In 1959 panchayat elections a brahmin was elected as sarpanch. Again in 1964 elections another brahmin-karanam was elected as sarpanch. Both won the panchayat elections as candidates of the Congress Party. It should be noted that it is these people who participated in Telengana armed struggle against the nizam under the Andhra Maha Sabha. So they carried the popularity of having fought against the nizam. By the same token, as the interviews with them show they were also conscious of upper caste domination - particularly of reddy domination. It would not be correct to hold that the reddy doras were alone oppressive. But the main cause which ignited the Telengana armed struggle was reddy oppression. Having been conscious of the causes and consequences of the armed struggle the brahmin-karanams of Janampally were more liberal.

Nevertheless, the brahmin patwari and other karnams continued to be the top landowners in the village, they owned more than 75 acres of land. But they cultivated this land through hired labour rather than through tenants. This land was later partitioned within both the families.

Backward Caste Peasantry

The break with brahmin dominance came in 1970. In the 1970 panchayat elections a yadava sarpanch was elected. This yadava sarpanch came from the meda family of yadavas to whom belonged the mali patel and police patel vatans. Thus it is since 1970 that the backward castes came to the forefront of village politics.

The yadavas' or gollas' main caste occupation is sheep grazing. In this village they combine it with agriculture. Most yadavas do own land and are small or middle farmers. Some yadavas own less than 10 acres and some less than five acres. The village productive forces are much better suited for the sustainability of dwarf holdings than in Bogaram. The village has four small tanks and one big tank as noted earlier. Most yadavas own their parcels of land under these tanks. (Since 1980 the four small tanks are used only as percolation tanks, i e, the water is stored and not used directly with the idea that the stored water would percolate into the wells dug in the ayacut area of the tanks. Thus tanks are used to enhance groundwater situation.) Much like Bogaram, in Janampally also electricity came in the early 1980s. Since then almost all backward caste small peasants have acquired electric motors and pumpsets.

Yadavas are numerically the most preponderant backward caste in the village. The next most important backward caste in the village is the weaver caste or the padmashalis. Weaving in the village is qualitatively different from that in Bogaram. We turn to this aspect below.

Apart from yadavas and weavers the third most important backward caste in the village is that of toddy tappers. Together these castes form a political block in the village. They are deeply conscious of their political, economic and social backwardness and also conscious of their numerical strength.

Weavers in the Janampally village are basically subsistence weavers. They weave primarily for the home market. Cotton and silk cloth and saris are produced here. Unlike in Bogaram village there are no master weavers. Weaving is done by independent family units. The cloth is supplied to the local co-operative society. The local (village) co-operative society markets the woven cloth through Andhra Pradesh weavers co-operative (APCO). Each silk sâri, for instance, sells for about Rs 1,000 to 1,500. It is precisely because there is no master weaver that there is little capital or land accumulation by weavers. In Bogaram village the master weaver system arose owing to the internationalisation of weaving. In contrast to this in Janampally village weaving is essentially for the national market.

Elections do take place for weavers' co-operative society. But the candidates do not use money, liquor, etc, for winning elections. The co-operative society chairperson is usually elected unanimously. Since liberalisation weavers have faced difficulties. As in Bogaram village, in Janampally also weavers face a rise in the prices of raw materials and stagnation in the prices of finished cloth. Besides this the weavers in Janampally also face competition from textile industry centred in and around Bombay. There is unequal competition between textile mills and handlooms. Often the market favours textile mills rather than handlooms. An inefficient system of marketing by local co-operative and APCO also aggravates the situation. The handloom weavers do not get payment promptly for the work done from APCO and consequently from the local co-operative. Padmashalis (weavers) of Janampally have not become landlords unlike those of Bogaram. There is

no internationalisation of handlooms; no master weavers; no three-tier structure of weaving; and no land accumulation.

Labour in Janampally

Janampally has two kinds of labour relations casual labour and attached labour. Casual wage labour is hired on daily basis. Wages for casual labour are around Rs 15 for women and Rs 30-40 for men. Under the attached labour or the 'jeethas' system the wage labourer is hired on annual contract basis. The rate for annual contract is Rs 6,000 to 7,000. Along with it the labourer is given a loan of about Rs 2,000 at 2 per cent per annum interest. Here the researcher could not find any debt bondage. Attached labourers never work for an employer for more than one year, the labourer usually pays off his debt at the end of the agricultural year and enters into contract for another year with another master. Usually attached labourers come from backward castes as well as from scheduled castes. Employers are either from upper castes, brahmins and reddys or from other backward castes.

Since 1980 labour is increasingly turning from work in the village to work in the nearby town. Nearly 60 labourers travel each day to the neighbouring town Chityal to work as 'hamali' coolies in the rice mills. There they earn more than the daily wage in the village, i e, about Rs 70 to 80.

Land Ownership

In Janampally village as we have noted earlier backward castes emerged in panchayat politics from 1970 onwards. They continue to hold on to village office posts – mali patel and kotval – which were bestowed upon them as early as 1900.

Landownership is no more concentrated in the hands of upper castes. But holdings of more than 25 acres, which is above the ceiling imposed by the government, continue to exist in the hands of brahmin landlords. But the holdings have declined substantially (from about 75 acres in 1970 to about 20-25 acres now).

Weavers at first bought lands from brahmins. Later weavers sold their lands to other backward castes such as yadavas and toddy tappers. Now it is yadavas and toddy tappers who form a majority of middle and small holders and who also run the village politics – *de jure* and de facto. In this village commercialisation has had considerable impact on the agrarian structure. Land values improved from about Rs 400 per acre in 1960 to Rs 25,000 to 30,000 per acre in 1990. In 1995 well situated wet land sold for about Rs 45,000 to Rs 50,000. Dry land now sells from about Rs 25,000 to Rs 30,000. Landlords declined because of partitioning of holdings, unmanageability and diversification of interests. Here no particular caste/class – such as master weavers of padmashali caste in Bogaram – acquired the lands. Many backward castes benefited from the decline of big landlords. Benefited in the sense that they bought the lands of erstwhile big landlords and strengthened their small and marginal farms.

No significant phenomenon of transformation of big landlords into 'capitalist landlords' was observable in the village, primarily because no drastic change occurred in the past 30 years in the productive forces or physical infrastructure of production. The advent of electricity and electric pumpsets has benefited the small and marginal peasants as much as the big landowners. Consequently no process of proletarianisation took place in the village.

Federal Financial Relations

The Plan/Non-Plan Conundrum

B P R Vithal

The division of total revenue expenditure into plan and non-plan and the division of functions and responsibilities between the Planning Commission and the Finance Commission have become important issues in federal financial relations. These can be discussed under four broad heads: (i) the constitutional aspects and how the various commissions have looked at them; (ii) the practical aspect; (iii) the impact of the dichotomy between the two institutions on fiscal discipline among the states; and (iv) the institutional aspects.

ECONOMIC and social planning is Entry 20 in the Concurrent List. In Articles 112 and 202 of the Constitution, where the annual financial statements of the union and the state governments are prescribed, it is stated in clause (1) that this shall consist of "a statement of the estimated receipts and expenditure of the government of India/state for that year". In the case of the estimates of expenditure, however, it is stated, in clause (2), that such estimates "shall distinguish expenditure on revenue account from other expenditure". Government accounts are, therefore, classified into 'revenue' and 'capital'. Neither plan nor non-plan expenditure is mentioned in the Constitution.

In Article 275, where grants-in-aid of revenues are related to "needs of assistance" as determined by a Finance Commission, no specific mention is made, in the substantive clause, of schemes of development, though these are mentioned in both the provisos under this article. From 1952 onwards, national plans for economic and social development were taken up progressively on a substantive scale. The budgetary sector of such plans being their most important and determinate component, even when they do not constitute a major portion of the total outlay, intergovernmental fiscal transfers for the plan assumed growing importance over the years. The appointment of a Planning Commission as a continuing body and the constitution of a National Development Council as the highest authority for approving national plans introduced extra-constitutional elements into federal fiscal relations. The plan has both revenue and capital components. The capital outlay in the state plans is financed by capital receipts, central loans and market borrowings. The finance commissions have had to examine these aspects when a specific reference was made to them of the debt position of the states. The commissions have also, suo mottu, recommended capital grants under upgradation of administration. But the main issue relating to the relative roles of the Planning and Finance Commissions has arisen in regard to plan revenue expenditure. As a result, the division of total revenue expenditure into plan and non-plan and the division of functions and responsibilities between the Planning Commission and Finance Commission have become important issues in federal financial relations. These can be discussed under four broad heads:

(1) the constitutional aspects and how the various commissions have looked at them;
(2) the practical aspect;
(3) the impact of the dichotomy between the two institutions, on fiscal discipline among the states; and
(4) the institutional aspects.

I
Constitutional Aspects and the Commissions

Briefly the position is that it is agreed by all that there is no constitutional bar to grants for plan purposes being recommended by a Finance Commission under Article 275. If there is a controversy, it is about Article 282 being used for this purpose. There is also no bar to such grants being given even for capital purposes.

The Second Commission, for the first time, specifically dealt with the question of co-ordination between the Planning and Finance Commissions. It is interesting to note that the difficulties that they listed in dovetailing the work of these two commissions have, more or less, persisted since then right up to now. They provide as good a justification as any for the subsequent practice of excluding plan expenditure from the purview of finance commissions. The difficulties mentioned by them were:

(i) the period of the plan and the five years to be covered by that commission were not co-terminus;
(ii) in the forecasts agreed to between the Planning Commission and the state governments, many states had underestimated their committed expenditure and overestimated the yield from existing sources of revenue;
(iii) this meant that the contribution from existing revenues, which were assumed for financing the plan, were not available;
(iv) the resources expected to be raised by the states through additional taxation were also likely to be absorbed for financing committed expenditure;
(v) the central assistance given for certain schemes was to taper off, creating a fresh liability (these are the centrally sponsored schemes).

It will be seen in the course of this chapter how prescient this analysis of the Second Commission was and how a situation described in 1957 continues to be true even today despite several successive finance commissions, five-year plans, and protestations of fiscal and budgetary reforms.

The terms of reference of the Third Commission specifically mentioned that the commission should take into account "the requirements of the Third Five-Year Plan". When this commission took this term of reference literally and took into account 75 per cent of the revenue component of the state plans while recommending devolution and grants-in-aid, its member-secretary recorded a note of dissent and subsequently the union government did not accept this part of the recommendations of that commission. Kamat's (member-secretary) contention was that, since central assistance had been specifically sanctioned for the Third Five-Year Plan, there was no need for the Finance Commission to again consider the question of grants for plan purposes. A point made by him in this note was that grants-in-aid under Article 275 had been hitherto looked upon as "untied and unconditional". If they were now given for plan purposes, a procedure for review would have to be prescribed under this Article which, in his view, would be more onerous than the procedure that the Planning Commission was following for review of expenditures from grants under Article 282. The interesting aspect of this is that while the finance commissions did not recommend plan grants they, nevertheless, prescribed reviews for grants under Article 275 for upgradation of administration. On the other hand, with central assistance for the state plans under Article 282 being distributed among the states in accordance with the Gadgil Formula, the Planning Commission did not undertake any specific review of the expenditure out of such grants, except for some earmarked items. Justice Rajamannar (in his minute appended to the report of the Fourth Commission) while taking the view that the

language of Article 282 was 'wide enough' to cover plan grants, doubted whether grants could be made under Article 282 "without tying them to a specific public purpose".

In the case of the Fourth Commission additional resource mobilisation during the forecast period was excluded from being considered under revenue resources, but the exclusion of plan expenditure was not expressly mentioned. However, the commission considered it desirable that, "the Planning Commission, having been specifically constituted for this purpose should have unhampered authority in this domain".

In the case of the Fifth and Sixth Commissions also non-plan expenditure was similarly excluded only by implication, in that only "maintenance of plan schemes" was mentioned under expenditure. The Fifth Commission took the view that the terms of reference did place a restriction on the commission recommending grants for social services outside the plan but they did not place "any limitation on the process of tax devolution". The Sixth Commission, however, noted that certain 'ground rules' for reassessment of the forecasts of state governments had 'by now become clearly established' among which was separation of non-plan from plan expenditure. From the Seventh Commission onwards the terms of reference clearly mentioned "the requirements on revenue account" of the states to meet "non-plan commitments or liabilities." The Seventh Commission also considered this 'a well established practice" and did not consider it a constraint on them. The Ninth Commission alone was an exception in that it was asked to take into account 'revenue expenditure' which would, by definition, include plan revenue expenditure. Nevertheless, the commission went into the question of the scope of Articles 275 and 282, took legal opinion and expressed the definite view that "grants for financing the state plans are very much within the purview of the commission under the said article" (i e, Article 275). This commission, in fact, went into the question of the financing of state plans under the Gadgil Formula, found a "basic flaw in the present system of federal fiscal transfers" and proposed what it considered a remedy for this under Article 275

The Tenth Commission expressed the view that "the present artificial distinction between plan and non-plan expenditures... shall be replaced by the simpler and conventionally well recognised distinctions between revenue and capital. Future finance commissions may be required to examine the aggregate requirements on revenue account and recommend means to bridge the revenue gaps". However, in the entire subsequent debate on the alternative scheme suggested by the Tenth Commission, this aspect has never been discussed.

II
The Practical Aspects

Plan expenditure is incremental expenditure. It is not synonymous with developmental expenditure. For analytical purposes, the heads of expenditure in a budget are some times categorised as 'developmental' and 'non-developmental', but this is neither statutory nor prescribed under the account rules. It is necessarily arbitrary and can change from time to time. For instance, Police Housing was not under the plan at one time, because it was considered as expenditure under the head Police, which is a 'non-developmental' head. Later, it was brought under the plan under 'Housing', which is a developmental head. The motive here was not that a more rational classification was being done but was to give access to funds available under the plan, which were more abundant than under non-plan. It also helps show larger plan outlays. The study team on 'Reforms in the structure of Budget and Accounts' (1971) had stated as follows:

> Incidentally, as plan is the instrument of development, plan expenditure has generally come to be associated with developmental expenditure and, as a corollary, an impression is sometimes created that expenditure which is not classified as 'plan expenditure' is non-developmental in character. However, a large chunk of expenditure which is now classified as 'non-plan' is also developmental in character but is classified as 'non-plan' expenditure either because it is a committed expenditure on completed schemes of earlier plans or is a spill over from the earlier plan or is outside the plan allocation agreed to by the Planning Commission. In our view, this position has given rise to some misunderstanding about the nature of public expenditures. We would, therefore, suggest that the Ministry of Finance and the Planning Commission may lay down guidelines for the classification of expenditure between 'plan' and 'non-plan'

The important point is that plan revenue expenditure is 'incremental expenditure' under heads of account which are considered to be developmental heads in the revenue budget and which alone figure as developmental sectors in a plan. Base level expenditure even under such 'developmental' heads of account is non-plan expenditure. However, all expenditure under non-developmental heads, base level and incremental, is non-plan.

There was incremental expenditure under developmental heads even before there were plans. The budgetary procedures distinguished between expenditures at current levels and fresh expenditure or new items of expenditure at that time also. Any incremental or new expenditure proposed for a succeeding year was considered under what was then called Part II of the budget. According to this procedure, all proposals for fresh expenditure, whenever mooted by any department were initially examined on merits by the department concerned and the finance department and a view was taken whether the

proposal deserves to be considered. At that stage the question of availability of funds for the scheme was not taken into account. Departments, therefore, accumulated what were called Part II schemes, which had been examined and agreed to but kept pending. In modern terminology this would be called 'a shelf of projects'. At the time of the budget exercise, the finance department would decide how much fresh expenditure would be possible in the next financial year. Depending on this, they would then call for Part II schemes and government would decide which would be included in the budget for sanction as new schemes. Initially plan schemes also figured as Part II schemes. The study team referred to above, commented as follows.

> At present, Part II of the Demands does not show the plan and non-plan components of expenditure under the various programmes, activities, schemes and organisations. The total provision on plan and non-plan accounts included in the Demand are shown as a footnote. While it is true that a separate document titled 'Plan-Budget Link' gives the details of plan expenditure included in each Demand, we feel that, in the context of the magnitude of the plan expenditure and the role of budget as an instrument for the execution of the plan programmes, Part II of the Demand itself should exhibit the distribution of the expenditure on the various programmes, activities and schemes between plan and non-plan items. This will ensure a better appreciation of the plan programmes and will also facilitate appraisal of the progress of plan against the targets.

Subsequently, plan and non-plan were indicated as two components in the budget itself.

The plan procedure was superior to the then existing procedure for sanction of new schemes in the budget, because the plan gave a framework of intersectoral priorities according to which the available surplus could be utilised for sanction of new schemes, whereas the old procedure would have been more arbitrary. Therefore, our problems have not arisen, strictly speaking, because of considering incremental expenditure to be plan expenditure but for other reasons, which we explain below.

Given the existence of two institutions, viz, the Finance Commission and the Planning Commission, the fact that plan expenditure is, by definition, incremental expenditure provides a logical basis for a division of functions between the two commissions on the analogy of the Part II procedure we have described above. The revenues and expenditures that finance commissions have been taking into account in the first year of their forecast periods are at current levels and would correspond to what used to be called Part I of the budget. The projections for the remaining four years would take into account the normal growth of these revenues and expenditures on the basis of past trends or some future anticipation of inflation. No new expenditure would be included. Such new expenditures and the additional resources to be raised for financing them would form part of the next plan. This was what was called Part II of the budget under the old procedures.

The Constitution requires a Finance Commission to be appointed once in five years. We modelled our planning process on that of the Soviet Union who adopted a five-year cycle for a plan. Therefore, by a historical accident, the two time cycles were such that the work of the two commissions could be dovetailed on the basis of a five-year cycle. At the time of the Ninth Commission the plan period and the period of forecast of the commission were synchronised. However, by the time the Tenth Commission was appointed, this was again disrupted and the commission pointed out that this issue was urgent and should be dealt with while determining the period for the next plan. The Eleventh Finance Commission should have been appointed by June 1997 at which time the five-year period from the date of appointment of the Tenth Commission expired. However, this was not done, presumably because a constitutional amendment was under discussion. We can only assume that the interpretation given to the constitutional provision was that the next commission need only be appointed such that its report would be available by the time the period covered by the Tenth Commission's recommendations expires. In all these 50 years, this was not the interpretation given to the constitutional provision. The Eleventh Commission has now been constituted on the July 3, 1998. Para 5 (iii) of the terms of reference states that the commission shall have regard to the "requirements of the states for meeting the plan and non-plan revenue expenditure". The Ninth Commission took into account plan revenue expenditure by implication because its terms of reference had mentioned 'revenue expenditure' without excluding plan revenue expenditure as had been done in the case of the previous commissions. The present term of reference is even more specific. This commission can, therefore, cover the entire revenue expenditure.

In para 5 (iv), the commission has been asked to take into account "maintenance of expenditure of plan schemes to be completed by March 31, 2000". In 1997 the then United Front government had reiterated its resolve to formulate a five-year plan for the period 1997-2002. As of this date, the present government of India has not made any clear statement in regard to the current plan. It is, therefore, still open to end the current plan by March 31, 2000. There is no sanctity in the five-year period for a plan and as such there should be no difficulty in taking the current plan to be for the period 1997-2000. This could be considered a three-year plan or three annual plans. Both these approaches have been adopted in the past. In view of the present uncertain economic situation, the next plan, if there is to be one, could be for the period 2000-2005, which would coincide with the period of forecast now indicated for the Eleventh Commission. If this is done, it would have the advantage of restoring the synchronisation between a plan period and the period covered by the Finance Commission as had been recommended by the Tenth Commission.

III
The Dichotomy and Fiscal Discipline

If the separation of functions between the two commissions could be justified on this logical ground, what exactly went wrong? While arriving at the base level for both revenues and expenditures, every Finance Commission had generally accepted the existing situation on the ground. It is this that has been sometimes criticised as a 'gap filling approach'. However, while making projections for the forecast period, they were not equally indulgent. They sought to introduce some measure of efficiency and discipline. Certain subsidies, like those for service charges for utilities like power and water, were not fully accepted. Adequate provision was made for maintenance of capital assets like roads, which the states were neglecting. Better results on public sector investments were assumed. In the case of those states, which were not putting in adequate effort to raise their own resources, a better effort was presumed. In actual practice, however, the states ignored every such recommendation of the finance commissions. Add to this the deus ex machina of inflation. The finance commissions have always made assumptions regarding inflation which neither previous trends nor future prudence justified. The only justification was that realism would be self-fulfilling and should, therefore, be avoided. This gave a not insubstantial fig leaf for the states to cover their own failings.

The commissions were too wise and experienced not to realise what was happening. But what could they do? They could neither wish away the irresolution of the state governments nor passively accept the inevitability of events. So they adopted the time-honoured device of closing their eyes and discovering reasons for hope in the future. The hope can always be nursed, except by anarchists, that, somewhere in them, governments have

the capacity to discern right and wrong and the resolution to take rational action. The assumptions of previous commissions were modified on the ground that knowledge had advanced, even if experience had stagnated. The bottom line was that the commission had to do its work within a stipulated period and the arithmetic had to add up and internally consistent, even if externally irrelevant. The finite limit was the centre's capacity to share its tax revenues with the states. The arithmetic was worked out first and the logic derived later. Like Avatars, the commissions arose periodically when the financial dharma was in disarray. They gave in their reports a new dispensation that would restore dharma But there were no Devas to leave in charge of the reformed situation. It is this phenomenon that the Tenth Commission neatly summed up by observing that "if in actual practice the picture turns out to be worse than what it is being projected, even our conservative assessment of what can realistically be done would have been proved wrong. It is a perpetual battle between hope and experience." This was one-half of what went wrong: the indifference or intransigence of the states and the helplessness of the finance commissions.

The other half has been due to the Planning Commission, more or less, closing its eyes to this phenomenon. To understand this, let us briefly explain the process.

I A state's revenue resources (RR) at the base level will be equal to state's own revenue resources (SRR) + share in central taxes (SCT).
(1) RR = SRR + SCT
The difference between such total revenue receipts and non-plan revenue expenditure (NPRE) is called Balance from Current Revenues (BCR)
(2) RR – NPRE = BCR
If at this stage
NPRE > RR
BCR will be negative.
In this case, the Finance Commission recommends an Article 275 grant to cover the negative BCR, then
RR + Article 275 grant = NPRE, therefore BCR = 0

II The plan revenue resources (PRR) for financing the revenue component of the state plan (PRE) are as follows:
(3) PRR = BCR + ARM + CA
Where ARM is additional resource mobilisation for the plan above the base level and CA is central assistance. The Gadgil Formula assistance is divided into 70 per cent loans and 30 per cent grants. Therefore, for the revenue component of the plan, CA will be 30 per cent of Gadgil Formula assistance.
(4) If BCR is 0, then
PRR = ARM + CA
(5) If BCR is negative
PRR = (ARM – BCR) + CA
(6) If, – BCR > ARM, then
ARM – BCR will be negative, i e, central assistance (CA) for the plan will be diverted to finance non-plan expenditure. This is already happening in the case of the Special Category states.
(7) If, – BCR is > ARM + CA
then, even the loan component of central assistance will go to finance non-plan revenue expenditure. This stage also has been reached in quite a few states.

At the end of a Finance Commission exercise, no state will have a negative BCR. If a negative BCR emerges, then it means that the position as envisaged by the commission has since deteriorated.

The resources of the state are reviewed in September-December by the Planning Commission for finalising the Annual Plan of the next financial year. As indicated above, this exercise must begin with a review of the BCR. The BCR being the end product of the exercise of a Finance Commission, such a review is, in effect, a review of the Finance Commission's estimate of the resource position of the state concerned. The Finance Commission, not being a continuing body, the Planning Commission can, through the instrumentality of this exercise, act as a monitor of the conditions prescribed by the Finance Commission. This, in fact, was a role that the Planning Commission was discharging during the first two decades. If a state under-provided for non-plan expenditure such as maintenance of roads in its anxiety to have a larger BCR so that it may have a larger plan outlay, the Planning Commission officials used to insist that the amounts prescribed by the Finance Commission must be provided. It was ensured at that time that the states provided for dearness allowances for staff in accordance with actual rate of inflation and not at the earlier hypothetical rates. This position underwent a change in the 1980s when the Planning Commission began sharing the anxiety of the states to show larger plan outlays and became indulgent in its scrutiny. If even after such an indulgent scrutiny of the resources of the states, the BCR and the ARM were not sufficient to justify a larger plan outlay, a new device was invented. It was called 'more efficient collection of state revenues and economies in non-plan expenditure'. It was not clear what effort was envisaged which would not have gone into the earlier exercise or estimation of ARM. The inevitable result of such an exercise was a shortfall in resources during the year.

The procedure followed by the Planning Commission for finalising annual plans of states also contained a lacuna that inevitably led to deficits on revenue account. The procedure was that the total approved plan outlay of a state was matched with total resources available. This would include revenue resources and expenditure as well as capital receipts and expenditure. The total plan outlay so approved is broken up into sectoral outlays. These sectoral outlays would contain both revenue and capital expenditures. Though some of the sectors may be predominantly the one or the other such as, for instance, education for revenue expenditure and irrigation for capital expenditure, the break up of the total plan outlay into revenue and capital expenditures can be known only from the state budgets. There is no matching of the revenue plan outlay with the revenue resources at the time of the discussions between the state governments and the Planning Commission. In a number of cases, therefore, the revenue plan outlay provided for by the state government in their budget exceeds the revenue resources available, though the total plan outlay and sectoral outlays may conform to the approvals given by the Planning Commission during the discussions. There is, therefore, *ab initio* a plan revenue deficit built into the budget itself. The Tenth Commission had commented on this as follows:

> There is a revenue plan which ought to be covered by revenue receipts. The clubbing of the revenue and capital components in one category termed as plan outlay has generated a tendency to use borrowings to finance revenue expenditure. It is imperative to match the revenue resources separately with the revenue component of the plan. Failure to appreciate this basic requirement of fiscal discipline is one of the main causes of the endemic fiscal disequilibrium. (Para 2.25, Report of the Tenth Commission).

The Planning Commission was thus, from year to year, faced with the two problems: (a) the BCR projected by the Finance Commission having disappeared; and (b) the BCR reworked at the time of the annual plan resource meetings also disappearing. As we have mentioned earlier, every Finance Commission has been confronted with deficits in the revenue budgets of the states, which ought not to have been there according to the calculations of the previous commission. The main difference between these two unanticipated gaps is that a Finance Commission, being a periodic body, has the consolation of being confronted with the sins of the state governments committed during the interregnum only. On the other hand, the Planning Commission, being a live and continuing body, is faced each year with the sins of commission of the

state governments and its own sins of omission. Deficits are sins; but while a non-plan deficit is mostly 'karma', i e, the fruits of past sins, a plan revenue deficit represents unrepentant continuing sin. A Finance Commission's dispensation is like the Catholic confessional: it condones past sins subject to certain penitence. The Planning Commission approving a plan with a deficit is the Pontiff approving continuing sinning.

The deterioration that has taken place in the financial situation of the states is, therefore, not attributable primarily to the fact that there have been two institutions dealing with federal financial transfers. It has been a result of our approach to plan financing. As we have seen, the budget exercise used to start by (a) an estimate of the revenue surplus available on the basis of current expenditures and expected revenue receipts and (b) deciding to what end this surplus would be applied. That this end, which was called Part II or New Schemes, would now be a more elaborate and consistent frame called a plan would not have made a difference. However, the process was reversed and the exercise began by (a) determining what should be our desired plan outlay and (b) deciding how additional resources would be mobilised for achieving this objective. The difference between objective and effort was conveniently covered by a deficit, which was now morally acceptable to the economists. Economic classification looked at expenditure, such as education and health as investments and not current expenditure It did not take into account the fact that, while investment in asset creation was expected to generate a return flow of non-tax revenues, current expenditure required tax returns to balance it. If this did not happen, a revenue deficit arose. This deficit was subsumed in the fiscal deficit and shared its respectability in economic discourse. The qualitative difference between a revenue deficit and a fiscal deficit was blurred and the one inexorable limit on current or revenue expenditure was removed. At best, ARM was used to assuage an uneasy conscience. ARM became a jumbled RAM mantra of the plan. The Soviet practice was approvingly quoted, where it was the plan that had the legal authority and not the budget. Financial 'santhoolan' was then considered as subversive of developmental effort as 'santhrushti' would now be considered as subverting the market.

IV
Institutional Arrangements

In considering the institutional arrangements we need to take into account constitutional provisions on the one hand, and the nature of the plan process, on the other. Two institutions already exist in this field, viz, the cinance commission as required by the Constitution, and the Planning Commission. However, we are at a juncture when, on the one hand, amendments to the provisions of the Constitution covering federal fiscal transfers are being considered and, on the other, the entire range of economic policies are being reviewed. Therefore, the nature of the two existing institutions need not be a constraint on any review we may now undertake.

The real distinction between these two bodies arises out of the nature of their tasks. A Finance Commission is a constitutional body charged with the responsibility of distributing resources between the different levels of government under the Constitution – the union, the states, and now the local bodies. A Planning Commission, even if it is made a constitutional body, will have the task of formulating plans which, by their very nature, will have to be, partly at least, political documents. The fact that the Planning Commission has been reconstituted whenever the parties in power at the centre have changed and that even plans previously prepared have been terminated when such changes occurred shows the political nature of this process. In the plan process, overall resources and the different levels of government are only the means for the achievement of certain socio-political goals.

Guhan had taken the view that, "There is, in fact, a 'clear rationale' for the Finance Commission not dealing with the plan revenue account". His objection is based on the fact that a Finance Commission is a "discreet occurrence" and not a "standing body" like the Planning Commission. If the logical consequence of treating the aggregate revenue account as one, including plan and non-plan, is that there should be one body which deals with all transfers, then Guhan would like this one body to be the Planning Commission (*EPW*, April 22, 1995). In that case the political nature of planning may vitiate the objectivity of federal fiscal transfers, both vertical and horizontal. Further, if we combine the functions of a Finance Commission and a Planning Commission in one institution, we will be imparting to it a strength in federal fiscal relations which was not considered desirable even in the heyday of socialist planning when it was said by some that the plan should prevail over the budget, as it did at that time in the Soviet Union. This very strength will call its objectivity into question in course of time.

Guhan reposes his hopes in the Planning Commission based on the fact that "linked as it is to the National Development Council" it will be in a position "to develop a long-term federal consensus on the extent and pattern of transfers from the centre to the states and between the states" and will not be "a gamble on the personal views of five persons, or a majority of them", as Justice Rajamannar had put it. This hope is based on several assumptions in regard to the Planning Commission, its relation to the NDC and the method of functioning of the NDC. The Finance Commission on the one hand, and the Planning Commission on the other, represent two different approaches to the settlement of inter-state issues. A review of the experience of the last four decades should help guide us in regard to the choice we have to make for the future. We have had, in the finance commissions, a kind of 'arbitration' or 'award' approach while the Planning Commission has had to adopt a more democratic approach of evolving a consensus. The Gadgil Formula represents the result of the consensus approach and the various formulae evolved by the 10 finance commissions so far represent the results of the 'gamble on the personal views' of 50 individuals, there is no reason to regret the gamble, since the horizontal transfers under the formulae devised by the various finance commissions have been more progressive than plan transfers under the Gadgil Formula. The Gadgil Formula itself has been further diluted or vitiated by devices such as centrally Sponsored Schemes and externally-aided projects.

The manner in which the Gadgil Formula was evolved and subsequently modified provides a good case study of the limitations of the consensus approach. The initial evolution of this formula and its approval by the NDC is an example of the best aspects of the consensus approach. It was not easy to evolve a formula for the first time when there was none. The fact that this was done is a tribute to the respect which Gadgil commanded at that time and the stature and statesmanship of the chief ministers who were then members of the NDC. The first modification of the Gadgil Formula, which increased the percentage available for states with per capita income below the all-India average was a progressive one but it was adopted by a procedure which was in complete contrast to the manner in which the formula itself has been evolved. The modification was announced by the then prime minister, Indira Gandhi, in her concluding remarks to the NDC almost as an aside to the proceedings. On subsequent occasions when an attempt was made to modify this formula, a transparent procedure was adopted in evolving and considering various alternatives, first when D T Lakdawala was the deputy chairman and subsequently when Madhu Dandawate was in-charge and A Vaidyanathan was the member concerned. But on both these occasions no decision could be arrived at. When the formula was, in fact, modified subsequently, it was done in the usual confused atmosphere.

These successive incidents are a commentary on the methods of obtaining a consensus. It would appear that in a democratic body consensus never really evolves but is often obtained by a process in which haste and confusion prevail over deliberation and clarity. The consensus is acquiesced in, not so much because every one accepts it but, because no one has sufficient conviction or energy left to disagree. The element of a gamble, therefore, is as much there in this democratic dynamics as there is in the award process. The difference is that, in one case there are 26 interested parties, while in the other there are five, perhaps, opinionated but disinterested players. A process of consensus is bound to be based on compromises, which may have the advantage of being generally acceptable but will suffer from the disadvantage of not fulfilling adequately the criteria of either efficiency or equity. As James Madison warned in the 'Federalist Papers', "in a search for consensus it would no longer be the majority that would rule, the power would be transferred to the minority". Any award may be a gamble, but the gamble arises out of internal biases and not external pressures. The choice between a Finance Commission and a Planning Commission type of institution will, therefore, have to take several other factors also into account and not merely the nature of their composition.

If the plan process is to continue as it has been so far, it would appear prudent to have two institutions. However, most experts and all finance commissions so far, are agreed that, even in such a situation, there are clear disadvantages in excluding plan revenue expenditure from the purview of the finance commissions. We have seen, in the course of our review earlier, how significant these difficulties and deficiencies have been. These can be overcome by allowing the Finance Commission to take into account the entire revenue expenditure, as was done in the case of the Ninth Commission and has now been done for the Eleventh Commission. The Finance Commission then makes projections for the forecast period with which it is concerned and determines total revenue expenditure under various sectors. After taking into account the total revenue receipts that, in their view, can be raised, grants under Article 275 are recommended. In these exercises it will have to make assumptions regarding rates of growth, etc, with which the Planning Commission may normally be concerned in the course of formulating plans. It would, therefore, be necessary to ensure close co-ordination between these two bodies. To facilitate this a convention had been established, since the Sixth Commission, of having a member of the Planning Commission on the Finance Commission.

The devolutions and grants under Article 275 recommended by the Finance Commission, if accepted, will be statutorily binding on the central government. The Planning Commission will have to take them as given. This is so even now when the Finance Commission does not take plan revenue expenditure into account. Finance commissions have entered the domain of developmental expenditure in their assumptions and through upgradation grants. However, these do not prevent the Planning Commission from formulating the revenue component of the plan on its own assumptions. If the planning commission's assumptions mean that plan revenue expenditure would be higher than what the Finance Commission had anticipated, the states will have to raise additional resources for this purpose. Conversely, if the plan envisaged by the Planning Commission had a lower revenue component, there will be a revenue surplus which will be available for financing capital expenditure. In either case the statutory devolutions and grants under Article 275 recommended by the Finance Commission will not be effected. The Ninth Commission, which has been asked to take total revenue expenditure into account, followed a similar approach. This did not prevent the Planning Commission from finalising the state plans on its own assumptions and recommending central assistance for such plans over and above the Article 275 grants recommended by the Finance Commission for plan purposes in the case of some states.

In the discussions in the Standing Committee of the Inter-State Council the proposal of the TFC, to prescribe in the Constitution the percentage share of the states in the gross proceeds of central taxes and keep it fixed for 15 years, was not accepted. The consensus was that the percentage should be 29 to begin with, as recommended by the TFC, but that it should be reviewed every five years by a Finance Commission. With this modification the alternative scheme will come down to only a change in the nature of the divisible pool. This pool will not be a percentage of two taxes as at present but will be the gross tax revenues of the centre. Everything else remains the same. With this, the relative roles of the finance and planning commissions become an issue again. The terms of reference of the Eleventh Commission, since constituted, require them to look into both plan and non-plan expenditure. One can, therefore, assume that the approach of the Eleventh Commission will be along the lines we have discussed above. All that would be required for this process to proceed smoothly would be that the period of forecast covered by the Finance Commission and the period of the next plan are the same.

A radical departure from the existing procedures would have been possible if the Alternative Scheme of Devolution recommended by the TFC had been accepted in its entirety. This envisaged the percentage share of the states in the gross tax revenues of the centre being prescribed in the Constitution and remaining fixed for a period of 15 years. The scheme does not deal with the horizontal distribution among the states of the total share of the states. It can be taken a step further by the percentage shares of the states, or the principles on which such percentages are to be determined also, being prescribed in the Constitution. Justice Rajamannar, in his minute appended to the Report of the Fourth Commission, had stated that: "As regards distribution *inter se* among the several states, the general principles and criteria may be laid down by the Constitution..." Guhan had also suggested that 'robust criteria' for horizontal distribution could now be included in the Constitution. Once the broad criteria for horizontal distribution are prescribed in the Constitution, the remaining exercise will be only to apply these principles to the actual situation from time to time. This can be done by the Planning Commission as part of its plan resources exercise. A Finance Commission will then be required, only once in 15 years, to determine the share of the states in the gross proceeds of central taxes. Since amendments of the Constitution have not yet been taken up, there is still scope for considering radical departures from the existing procedures and institutional set up consistent with the new economic environment and policies.

In other federations, there are institutions like Grants Commissions. The Reserve Bank of India has suggested a State Funding Corporation to deal with market borrowings by the states. If there is such a body it could also deal with examining specific projects proposed by the states with a view to determining their economic viability for purposes of market borrowing as well as for loans from the centre to the states. The role of the Planning Commission will have to be reconsidered in the light of these various changes. The basic issue is not an institutional one; it concerns our approach to fiscal policy in the coming years. In the past, the plan process had either built in a certain amount of deficit in its calculations or had, at least, condoned it after the event. If we are agreed that we are entering a period of fiscal discipline, then the primary and undisputed objective has to be that there can be no deficit on the revenue account, whatever the fiscal deficit may be. Our institutional arrangements must then be such as to be in consonance with this approach.

My people - My strength

LIC's Group Superannuation and Group Gratuity Schemes - The driving force

Group Superannuation Scheme

- Contributions (inclusive of PF), are tax deductible up to 27% of salary.
- If implemented retrospectively, up to 80% of contributions (with respect to past service), are allowed for tax deduction spread over 5 years.
- Interest accrued at the rate of 11 75% to 12.8% p.a. (during the financial year 1998-99), depending on the size of the fund
- The Superannuation Scheme can also be linked to life insurance cover
- On retirement, a choice of pension payment plans is available.

Group Gratuity Scheme

- Simple administration, no more worries of planning for gratuity payments
- Attractive returns and tax benefits.
- Scientific funding of gratuity liability based on actuarial valuation
- Instalment funding for past liability, eligible for 100% income tax deduction in the year of payment.
- Employees insured for death benefit based on full anticipated service
- Dual benefit of liquidity with high yield.
- Interest accrued at the rate of 11.75% to 12.8% p.a. (during the financial year 1998-99), depending on the size of the fund.

For details, mail us this coupon or contact us at the nearest LIC Divisional Office / Zonal Office

Gold Hunger

The country's gold stock at the end of 1997 was nearly four times the official foreign exchange reserves. The continued rapid growth of gold inflow has [illegible] consequences in terms of the scale and functioning of the 'hawala' [illegible], the availability of foreign exchange for other uses and the health of the balance of payments. The factors determining the demand for gold and the sources of finance for importing it therefore merit closer study. 471

Cultural Politics under Globalisation

The intercultural, the multicultural and the global inhabit different yet overlapping narratives that should not be arbitrarily conflated. An exploration of the political dynamics of these phenomena and their implications in the actual making of specific cultural practices: how we situate our inherited and emergent conceptions of culture within the larger map of the world, how we can resist the increasingly sophisticated appropriations of non-western resources through new technologies and treaties, how we read first world interpretations not merely of 'our' cultures but of migrant/immigrant cultures within 'their' frameworks of citizenship, and how we activise a critical and responsible exchange of cultures against the demands of market forces and the insularities of pseudo-swadeshi nationalists. 477

Widening Income Gap

Internationally and intertemporally comparable real income data over the period 1950-1992 yield significant evidence of widening gap in the standards of living of the North and the South. If there is evidence of convergence, it is between the less rich North and the richer North and between the poorer South and the less poor South. 500

Fertility Decline without Development

The southern states are, on the whole, undergoing a fertility transition. Kerala and Tamil Nadu have already achieved replacement-level fertility. The dramatic fertility decline in Andhra Pradesh shows that this state will follow the other two soon. The picture of fertility decline in Andhra Pradesh and a discussion of alternative explanations. 491

Health in Ninth Plan

Against the background of the convincing evidence that the long neglect of public health is dramatically changing the country's epidemiological profile, it is a matter for concern that the Ninth Plan does not pay enough attention to improving public health services. 455

Kautilya and Customs

The tax structure of the day as revealed in *Arthasastra*, Kautilya's 2,300-year old treatise, shows interesting parallels with currently prescribed valuation principles and practices. 449

Pakistan and IMF

The expectation that the resumption of IMF lending will rescue Pakistan's economy is based on fiction, not fact. It will at best provide some breathing space, nothing more. 457

Silent Crime

Banda district in the Bundelkhand region of UP is in the news generally because it is the home of the dreaded dacoit Dadua and his gang, but the crime that escapes notice is the extensive domestic violence against women in the area, one of the most backward in the country in terms of the parameters of women's progress. Story of a campaign by a women's group against domestic violence in the region. 453

Hindutva and Gulf Money

The influx of Gulf money and the growth of new industries and business in the coastal regions of Karnataka have created new identities which have affected old relationships among castes and communities. The rise of Hindutva forces and the recent riots in this area need to be seen in the context of these socio-economic changes. 446

Apex Court on Narmada

THE permission given by the Supreme Court to the Gujarat government to proceed with the work on the controversial Sardar Sarovar Project (SSP) in the Narmada valley, from 80.3 metres does not seem justifiable or logical in the light of the realities regarding the displacement and resettlement caused by the dam. It would also send undesirable signals regarding the displacement of the tribals and all dispossessed people. The Court has given its consent for an 'independent authority' appointed by the state government for 'grievance redressal' and ordered that the authority should file its interim report on the conditions of the SSP oustees resettled in Gujarat till April 9, on the basis of which the court would consider the issue of increasing the height of the dam up to 90 metres, in a hearing fixed for April 15. The Court did not give any directions about increasing the dam height to 110 metres or the height at which the benefits of the dam would accrue. the ultimate proposed height of 139 metres (455 ft). Madhya Pradesh opposed the granting of permission but the Court advised it to solve its dispute with the Gujarat government in other fora. The MP government has decided to file a suit demanding a new tribunal to decide about the project. The interim order came on February 18, at the end of the 'final hearing' of the writ petition filed by the Narmada Bachao Andolan (NBA) which had demanded a comprehensive review of the project on all aspects and the stoppage of the work on the dam, with no furher submergence and displacement. Work on the dam was suspended from January 1995 due to people's resistance as the Court refused to permit the construction on the riverbed of the dam from May 1995.

The permission for the work up to 85 metres will affect the tribal belt of the Narmada Valley most. The villages in Akkalkuva and Akrani tehsils in Maharashtra and Alirajpur in MP would be hit the worst. Even villages in Dhar and Badwani districts would be hit due to the dam. The people have yet to be resettled, but they would face submergence and be compelled to be displaced due to the Court order. The ground situation regarding the displacement and resettlement is totally at variance with what was represented by the Gujarat lawyer. The Andolan counsel Shanti Bhushan pointed out that even in the limited perspective of resettlement up to 85 metres, unless the oustees below the height be resettled fully six months before the construction, submergence cannot be permitted. He also referred to the hollowness of the offers of the resettlement land to the prospective oustees up to 85 metres. He gave instances of the non-availability of cultivable land and other serious shortcomings in the resettlement sites. In such a situation, he said, it would be a violation of the award of the Narmada Water Disputes Tribunal (NWDT) and other legal and constitutional rights.

The court restricted itself to the issue of what it called, 'relief and rehabilitation' of the oustees. Though the NBA has raised relevant issues including cost benefits, environmental impact, along with the displacement and social equity the Court thought it fit to reduce the issues to rehabilitation, that too in a piecemeal way. This time the Court wanted to talk only about rehabilitation up to 90 metres of the height of the dam – as demanded by the Gujarat government. Even here the Court did not think it fit to take cognisance of the abysmal conditions of those who have already been displaced. The first villages near the site, Vadgam and Manibeli could not be resettled fully even after the dam was built and filled in. NBA has prepared painstakingly detailed surveys of the conditions of the resettlement sites in Gujarat and Maharashtra. However, this was not given due importance by the Court, while the government data was taken as the basis for the deliberations. The appointment of the 'grievance redressal authority' may be a redeeming feature, but it cannot compensate for the damage caused by permitting work on the dam. The evaluation of the cost-benefit of the dam, its 'public purpose' becomes imperative in view of the insistence on the part of the government that the project is in the 'national interest'.

The NBA accepts the decisions and hopes that the Grievance Redressal Committee headed by Justice P D Desai will bring out the true picture regarding the existing conditions of the oustees and the overall view regarding the displacement and resettlement. Our future course will be decided after meetings with the villagers in the valley. The people's struggle will continue as it has through all these 15years. The Narmada struggle has been a part of the larger struggle of the depressed classes, tribals, dalits, farmers of this nation to protect their rights, life and resources from the onslaught in the name of development, globalisation, etc. All the organisations and movements along with the conscientious citizens will have to watch the way the courts too have been acting with regard to the democratic and human rights developments.

Mumbai

ECONOMIC AND POLITICAL WEEKLY

Scripting a Detente

WITHOUT a doubt the glitter and the glamour attending the high profile drama at the border-post of Wagah last week was well orchestrated and rehearsed on both sides of the border. Cynics may well comment on the emptiness of the ritual and yet, given the historical circumstances, it is difficult to imagine any attempt at a detente in India-Pakistan relations that would not prompt an emotional response. Certainly both governments, in Islamabad and Delhi, knew this well and the symbolic 'reopening' of the border with the Indian prime minister and his entourage travelling across it on the first bus service between the two countries was meant to capture that emotion, to perhaps hopefully find a way across immovable obstacles in the long and so far tedious process of dialogue. The rhetoric – Vajpayee's "defining moment in south Asian history" – was tailored for the occasion. After all, for both Atal Behari Vajpayee and Nawaz Sharif, the smooth passage of the meeting at the Wagah border was critically important.

Unlike other summits, this meeting was not a culmination, or even a high point, of long rounds of discussions between the two countries. It would be futile then to look for substance of great significance in the various communiques that will be issued. It is the event that is in focus – the highly emotive reception to the Indian prime minister, Nawaz Sharif walking into no man's land to receive him, the Pakistani armed forces band playing the Indian anthem; the moment-to-moment television coverage – it was the stuff of which history is constructed. Nothing has been allowed to mar the event. The Jamaat-i-Islami had called for and enforced with some violence a Lahore bandh, and on the other side, militants attacked and massacred several people in two districts of Jammu. The first has not significantly affected the Indian visit; the second incident found pointed mention but in passing in the Indian prime minister's speech.

For all the symbolism, however, the summit is well grounded in the changing political realities in the two countries and in the region over the last few years. There have been numerous references to the efforts of the past, especially the Shimla Agreement and the need to adhere to its framework. The agreement between the two prime ministers in September 1988 seeking "an environment of peace and security in the supreme national interest of both countries" is being stressed. The SAARC commitments of both countries are also being recalled. While all this may be dismissed as so much rhetoric it is significant that an attempt is being made to root the current phase of dialogue in past such efforts, even as it is sought to transform the nature of the current exchanges. And it is here that Vajpayee and his foreign policy establishment have in a calculated way moved beyond the Gujral formula of 1997 in putting Kashmir on the agenda. Then, in 1997, the BJP in opposition had objected to the proposal to put that issue on the agenda of the talks between the two foreign secretaries. Clearly, there has been much thought given to just how much is to be conceded, even at this stage, without upsetting the fine balance in the political formation at the centre, even while attracting different sections, business and industry as well as the intellectual community and perhaps a small but significant and growing section of educated middle class youth to whom a south Asian matrix may hold appeal.

On the Pakistani side Sharif has been under some pressure from his own party as well as from the foreign policy establishment to seek some movement on Kashmir before the dialogue went any further. On the face of it Sharif is operating from a position of strength, having a majority in parliament. However, he has not been able to carry all elements of the party on his notion of breaking the impasse of hostility and mistrust between the two countries. Moreover, the army brass steadfastly refused to participate in the bonhomie at the Wagah border using the visit of the Chinese delegation as an excuse. At another level, Sharif has been riding roughshod over the press that has turned hostile to the government in Islamabad (to the extent that none of the Pakistani newspapers headlined the Indian prime minister's visit). The government's other actions in recent months have earned it a poor reputation in the area of democratic practice and civil liberties. Given all this, there may be some misgivings that Sharif's initiatives with regard to relations with India, however enterprising, may not garner sufficient support in the long run.

However, apart from the national imperatives and predilections, it is the emerging geopolitical factors which made the summit and its dramatisation not only possible but necessary. While with the Gujral initiative there had been much breaking of the ice, especially on the trade and cultural fronts, the two countries had been forced to play a guessing game on the nuclear issue, neither wanting to give away too much, while ensuring that a perception of threat existed, since May last this situation has changed. It is clear now that both the nuclear establishments have been long prepared for developing nuclear capability and both have the expertise as well as the material to produce nuclear devices of some sophistication in the short term. In effect the May explosions have served to neutralise the imagined advantage on both sides. It is therefore now possible to talk of confidence-building measures in nuclear and conventional fields. As Vajpayee has pointed out, "A small spark can now cause a huge fire. There is no option available to us except peace." It is expected then that the two governments will commit

themselves to reducing the risk of accidental use of nuclear weapons and to improving communications facilities. None of this would have been possible without both countries acknowledging the other's nuclear status. Thus while the exploding of the nuclear devices in May closed forever for India the moral high ground of pursuing and persuading others to follow the path towards a nuclear-free world, the Vajpayee government appears to have chosen to make the best of a lost opportunity by gaining new ground in the arena of international diplomacy.

STEEL INDUSTRY

Not by Protection

IT was entirely predictable. The country's steel producers are going to raise prices by 8 to 9 per cent. The steel producers' move is, of course, closely linked to the government's decision in November last year to impose an anti-dumping duty on steel imports which was followed within weeks by the announcement that import of steel products would not be permitted below specified floor prices. These decisions had followed intense lobbying by the steel producers who, faced with a slump in domestic demand for steel products because of the economic downturn, had complained of dumping especially by exporters from Russia and certain east European countries. Immediately on the heels of the government's actions, the steel producers had revoked the substantial rebates they had been offering buyers till then and this week has come the announcement of the actual raising of prices.

The imposition of floor prices on imports has naturally been opposed by industries using steel products. The Cold Rolled Steel Manufacturers' Association, for instance, has argued that it would result in steep increases in raw material costs of its member units and, interestingly, alleged that these increases would in turn make their products non-competitive vis-a-vis imports of the relevant finished products. It has also been pointed out that the floor prices of imports have been fixed at levels much above those that the government's own designated authority to decide on the levy of the anti-dumping duty had regarded as fair for the purpose of determining the anti-dumping duty.

What the dispute has once again highlighted is the importance of safeguarding the legitimate interests of both producer- and user-industries in dealing with situations of alleged dumping and unfair competition from imports. In the present instance, the case made out by the steel producers is far from conclusive. For one thing, there is no evidence of a flood of steel imports into the country. Government figures show imports during April 1998-January 1999 to have been in fact more than a third lower at 9 lakh tonnes compared to 13.9 lakh tonnes in the corresponding months of 1997-98. The slackening of domestic demand for steel is, of course, indisputable and has forced the main producers especially to cut production by a little over 6 per cent in the period referred to above.

There has also been a sharp fall in international steel prices because of heightened competition among steel producers worldwide. It does not follow, however, that it is necessarily desirable that because of the problems facing domestic steel producers Indian steel-using industries must be deprived of the advantage of internationally available cheap steel. Quite conceivably, and contrary to the visceral reactions of the 'swadeshi' enthusiasts, to do so might be to harm the interests of the economy as a whole and the country. The point is that it is necessary to have institutions which can decide on these issues competently, objectively and transparently. It is a pity that after nearly a decade of economic reforms we still lack such institutions. Certainly, the manner of levy of the anti-dumping duty on steel imports and, much more so, the way minimum floor prices for these imports have been fixed by the government simply do not inspire confidence that the decisions in question are in the national interest.

Anyone who believes that the problems of the Indian steel industry are only those of a temporary slump in domestic demand and dumping by unscrupulous international manufacturers and traders is living in a fool's paradise. Consider the string of mammoth half-finished steel projects in the private sector stuck in the throats of the IDBI and the other financial institutions which can neither spit out nor swallow them. The so-called cost overruns, amounting to hundreds and thousands of crores of rupees, bear testimony to how cavalierly the projects were launched by their promoters and how casually they were accepted for financing by the financial institutions. The picture of the public sector steel industry is hardly any prettier. Perfidious decisions, explainable only in terms of political pork-barrelling, such as to pour huge sums into dead-as-a-dodo Indian Iron and Steel apart, SAIL's own plants are today, after vastly expensive modernisation and expansion schemes (typical examples of the 'soft budget constraint' in operation), all dressed up with nowhere to go, so to say.

To be sure, the situation of the Indian steel industry is not unique. The funny thing is we are told more about how, say, Japanese steel companies like Nippon, Kawasaki, Kobe, NKK or Sumitomo plan to reorganise and restructure themselves to survive and grow in the dramatically altered world steel scenario than about how our own steel makers, in the public and private sectors alike, propose to get out of the pits they have dug themselves into.

ORISSA

Difficult Task

IN an ironic turn of events the Congress high command which had sidelined Giridhar Gamang at the last minute to install J B Patnaik as the chief minister of Orissa in 1995, had to turn to Gamang to tide over what appeared to be an irresolvable factional conflict gripping the Congress Legislature Party (CLP). The alliance which was forged by the then chief minister J B Patnaik and his two deputy chief ministers, Basant Biswal and Hemanand Biswal, to keep out Gamang in 1995, did not take long to crumble under the pressure of an internal power struggle. Soon Hemanand Biswal resigned his deputy chief ministership and had to be accommodated as the pradesh Congress committee chief. While Basant Biswal, though continuing as deputy chief minister in Patnaik's ministry, nursed a grudge towards Patnaik for being stripped of his finance portfolio in 1998. It was only to be expected then that the two leaders would be in the forefront of the campaign seeking Patnaik's dismissal in the wake of Anjana Mishra's alleged gang rape and the series of attacks on Christians in the state.

Having convinced the party high command of the necessity to dislodge Patnaik to stem the party's plummeting fortunes in view of the forthcoming assembly elections, the Congress dissidents nevertheless found themselves unable to mobilise a majority against Patnaik in the CLP. With Patnaik, though removed from the chief ministership, determined to foil the plans of the dissidents to decide his successor, the Congress high command turned to Gamang, whose credentials as an eight-time MP from Koraput are expected to enable him transcend the factional infighting within the state party.

Yet the prime worry for the Congress will be whether Gamang will be successful in recruiting the loyalty of the various faction leaders in the state before the assembly elections. Hailing from the tribal region of western Orissa, his skills will be tested in making the state Congress leaders, who largely belong to coastal

Orissa, work with him. The note of dissent voiced by senior Congress leader Nandini Sathpathy at the appointment of Gamang is an indication that the transition is not going to be smooth. Moreover, Gamang, his clean image notwithstanding, lacks mass following in the state which is reflected in the fact that in spite of his being a tribal, he does not enjoy the support of the tribal MLAs of his party. On the other hand, any appearance of reliance on Patnaik, the only Congress leader with a following in the state, is bound to revive friction within the party. Negotiating his way through the bitterly divided state Congress, while having no mass base of his own, and steering the party successfully through the elections are daunting tasks before the new chief minister. But more importantly, besides improving law and order in the state, speeding up the investigation in Anjana Mishra's case would be something the public at large in Orissa will be looking forward to. For these were the very events that catalysed the political turmoil in the state and forced the central Congress leadership to effect the change of guard.

NDC

A Ritual

THE National Development Council (NDC) which is supposed to be the apex body in the field of national planning met in New Delhi this week, after a gap of over two years. The last meeting of the council was held in January 1997. It is relevant to recall that when the council's composition and functions were revised in October 1967, the government resolution on the subject required that the council should meet "as often as may be necessary and at least twice in each year". This was obviously considered necessary in the light of the tasks supposedly assigned to the council, in addition to the broad objective of promoting understanding and consultation between the centre and the states on planning and economic policies. The four important functions assigned to the council were to (1) review the working of the national plan from time to time, (2) consider important questions of social and economic policy affecting national development, (3) recommend measures for achieving the aims and targets of the national plan, and (4) prescribe guidelines for the formulation of the national plan including the assessment of resources for the plan.

Unfortunately, as was noted by the Sarkaria Commission, in the actual working of the council "formalism rather than systematic and effective participation in forging consensus and commitment to national policies became the dominant feature", giving rise to complaints that plan strategies and policies were not being opened to sufficient national debate and informed consideration, but were rather hurriedly put through. The Sarkaria Commission felt therefore that the council had to be made "to function more effectively and emerge as the highest political level inter-governmental body for giving directions and thrust to planned development of the country". For this purpose the commission recommended that instead of constituting the council under a government resolution, a presidential order under Article 263 should be used so that the council would have "direct moorings in the Constitution".

The Sarkaria Commission also felt that in the interest of healthier centre-state relations the council or its standing committee "should meet regularly to consider important economic issues of national significance in addition to the usual developmental issues". It is unfortunate that the Sarkaria Commission's recommendation on the subject of constituting the NDC and its standing committee and their functioning have not been acted upon with the result that not only has the council been convened most irregularly, but also the procedures adopted for its deliberations have been most perfunctory. Hardly has the council met more than once a year on an average since its establishment in August 1952. Worse, its meetings have been reduced to a mere ritual. It is pertinent to note that the agenda papers for this week's meeting of the council were circulated to the state governments just one week before the meeting and these included the Ninth Five-Year Plan running to 1313 pages in two volumes.

In the circumstances how seriously can anyone take the reported approval of the Ninth Plan by the council?

IRAQ, KOSOVO AND UN

Different Strokes

S Nanjundan writes:

THE UN Security Council has gone into hibernation over the Iraq question for almost two months now since the disclosure of UNSCOM inspectors spying for the US, the unauthorised withdrawal of inspectors and the unilateral airstrikes by the US and UK which have continued todate. The reasons for the strikes have varied from initially the refusal of permission for inspection of Bathist Party headquarters to destruction of identified weapon storage sites to recently Iraqi violation of US-UK unilaterally imposed no-fly zones in the north and south of the country. France, Russia and China initially demurred over the air strikes and the resultant damage to civilians. Physical and social infrastructure has been damaged according to UN sources engaged in the food supply programme in Iraq. Saddam Hussein's dictatorship is perhaps less anti-people than the feudalistic regimes in Kuwait and Saudi Arabia and his treatment of Kurds more democratic and humane than Turkey's. Yet Turkey, Kuwait and Saudi Arabia are western allies, Iraq the sole enemy. The underlying strategic reason for the west is the oil resources of the Gulf and the security of Israel. The strategy works because Egypt, Saudi Arabia and Kuwait regard Saddam as a threat and are happy that the US does the dirty job. What should be of particular significance and worth noting in the post-cold war world order is the impotence of the post-1945 UN security system to meet the challenges of sole superpower hegemonism taking hold at the turn of the millennium.

The approach in the Kosovo issue is quite different. Slobodan Milosevic is no less a dictator than Saddam Hussein. He manoeuvred victory out of defeat in Serbia by becoming president of Yugoslavia which now consists of only Serbia and Montenegro. Kosovo is a constitutionally autonomous province in Serbia consisting mostly of Muslims, ethnically the same as neighbouring Albanians. Here the US approach has been of patient negotiations between the parties assisted by the group of foreign ministers of US, UK, France, Germany and Russia. NATO has taken over after the failure of a system of monitoring by the Council for Security and Co-operation in Europe (CSCE) of a ceasefire instituted last October. The west has been most reluctant to use force because no strategic interest is involved and because Serbia enjoys the support of Russia, and lately of China. This is a dispute within the Christian civilisation, the losers will be Muslims. The UN security system is again not directly involved.

The lesson is that the current world order is of US hegemonism. Strobe Talbott, the US interlocutor in the post-Pokhran Indo-US negotiations, has in a recent article in *Foreign Affairs* stated that India should not be rewarded for violating the nuclear non-proliferation treaty by being given a permanent seat in the UN Security Council. Talbott well knows that India did not subscribe to the NPT. It did not even participate in the conference extending NPT. The real reason for US opposition to India "would be not to build up within the Security Council a group which might successfully checkmate US hegemony: Russia, China, India, perhaps joined by France. The omens are not very propitious for the new millennium.

CURRENT STATISTICS

EPW Research Foundation

In the new national income series, upward revisions have ranged from about 13 per cent in agriculture to 22 per cent in mining and over 30 per cent in some of the services. In contrast, GDP in unregistered manufacturing (–12 per cent), electricity (–1 per cent) and construction (–5 per cent) has been revised downward. Overall, as compared with the old series, the share of manufacturing in total GDP has suffered a decline, whereas those of agriculture and services have shown an improvement. Large revisions in the services sector have occurred because of the inclusion of new items and in unregistered manufacturing because of use of NSS employment data instead of population census data.

SAIL

Crushing Legacy

SLUGGISH demand for steel in the domestic market coupled with competition from imports due to lower international prices and enhancement of supplies in the domestic market resulted in a stress on margins for the steel industry. The performance of the Steel Authority of India (SAIL) was further affected due to additional costs in the form of depreciation and interest charges following the modernisation of its Durgapur Steel Plant (DSP) and other capital schemes and the subsequent increase in working capital needs. The poor growth in industrial production affected demand for steel during the year. With the situation not improving even during 1998-99, SAIL reported a loss of Rs 617 crore during the half year ended September 1998. The public sector company had reported a profit of Rs 54 crore during the corresponding period last year.

IDBI, a major creditor of the company, proposed selling off of SAIL's loss-making subsidiaries like IISCO and non-core businesses like power plants. The financial institution has also recommended hiving off of DSP and the stainless steel unit at Salem in order to generate the needed resources to help SAIL recover. The logic of selling off two of SAIL's core operations is that getting rid of these two loss-making units will immediately improve SAIL's stock value and make what remains a viable option. However, SAIL has spent over Rs 5,000 crore on the DSP unit which now has an installed capacity of 1.6 million tonnes per annum, whereas it would cost only around Rs 3,000 crore to set up a modern green-field steel plant of 1.5 million tonnes capacity Naturally, the transaction would have to take place at a loss. Further, the plant has a massive workforce of around 30,000 when it is possible to run a plant of the same capacity with a labour force of no more than 6,000. Anybody who has to shoulder such a huge workforce will definitely deduct that cost from the price while purchasing the unit. Besides, it would also be difficult to apportion the stock of total debt to the various plants, and similarly mark out each unit's share of the steel development fund loans, in order to arrive at an approximate cost of the DSP. However, the steel company has taken up the challenge and its board has approved conversion of the Rs 5,000-crore loan from the steel development fund to capital reserves and the spinning off of DSP and the Salem plant into separate entities as part of the financial restructuring plan submitted by the IDBI.

VIKRANT TYRES

Higher Market Share

The Mysore-based Vikrant Tyres, which was taken over by J K Tyres almost two years ago, has considerably improved its performance in 1997-98 and has managed to wipe off its accumulated losses. The company saw a 6.5 per cent rise in net sales over the previous year, while operating profit surged by 58.2 per cent during the same period. Lower non-operating loss (down 55 per cent), interest (lower by 20.7 per cent) and depreciation (which fell by 8.1 per cent) helped the company post a net profit of Rs 16.5 crore as compared to a net loss of Rs 5.4 crore in the previous year. The company has now drawn up a modernisation and balancing plan with an outlay of Rs 273 crore for upgrading its truck radials facilities and modernisation of both its plants.

Meanwhile, Vikrant Tyres has entered into a technical collaboration agreement with Continental AG, Germany, which is the world's fourth largest tyre

(Rs lakh)

NA: means not available.

manufacturer. It will receive state-of-the-art technology which will enable it to manufacture superior quality truck/bus steel radial tyres.

Currently, J K Industries and Vikrant Tyres have together become the largest manufacturer of truck and bus tyres with a 21 per cent market share. The market share of MRF was 19 per cent while that of Apollo was 20 per cent. Vikrant Tyres now plans to increase its capacity from two lakh radial tyres to three lakh tyres as its capacity utilisation has already gone up from 65 per cent to 80 per cent.

ZENITH

Expansion and Modernisation

Zenith, chaired by Yash Birla, is engaged in the manufacture of steel pipes, industrial tools and knives, sockets, acid, drills, reamers, cutters, taps, tool bits and man-made fibre yarn. The company performed well in 1997-98, notching up an increase of 39.1 per cent in net sales. Operating profit soared by 46.3 per cent during the same period. A fall in interest charges (down 2.2 per cent) and a lower increase in depreciation helped the company post a sharp increase in its bottom line (up 89.5 per cent). The company claims that the higher profit was possible mainly due to control of interest charges, further reduction in the cost of raw material, wages and other expenses and by improvement in operational efficiencies. The favourable market conditions for its chemicals have also helped. While steel pipes is the largest contributor to the company's turnover garnering around 43 per cent of total sales, acid brings in another 23 per cent. Chemicals account for around 13 per cent of the company's earnings and man-made fibre yarn is responsible for around 10 per cent.

Production at the company's pipe division more than doubled during the year under review from 24,834 tonnes to 50,493 tonnes. Despite the increase in production, the division has been unable to show a profit. On the other hand, the profitability of the chemical division has been significantly better than last year. After achieving a production of 2,734 tonnes in the previous year, the company surpassed its own record by producing 2,963 tonnes of chemicals in 1997-98. The company has increased the capacity to manufacture H-Acid by 500 tonnes per annum and that for other intermediates by 400 tonnes per annum.

KARNATAKA

Communal Violence in Coastal Belt

Muzaffar Assadi

The coastal regions of Karnataka have undergone dramatic change in their social and economic profile in the last 20 years. The influx of Gulf money and the growth of new industries and businesses have created new identities which have affected the old relationships among the castes and communities. The rise of the Hindutva forces here and the recent riots must be seen in the context of these changes.

WHEN everyone was celebrating new year's eve and preparing themselves for the new millennium, people in the coastal belt of Karnataka particularly Dakshina Kannada (DK)/Mangalore district were in mourning over the death of many people and loss of property in the communal riots. This communal riot was unusual for the coastal belt. DK district is known for tranquillity and modernity. It is one of the fastest growing districts, with its economy linking to national/international market/capital. It has been absorbing western cultures and tastes, much faster than any other districts in Karnataka. Here the literacy rate is very high and development in other fields like education, banking industries, health care, communication and transportation are much better than in any other district in the state. Its economy is a peculiar one – combining the features of urban/cosmopolitan and rural economies – a 'ruruban'.

Mangalore or Dakshina Kannada has hardly witnessed a major communal riot in its history. The first major riot broke out in 1968, centring around the port areas of Mangalore leading to the death of one person. Of late communal tensions have been building up in many places especially after the demolition of Babri masjid and the subsequent 'saffronisation of coastal belt' during the election. These tensions have so far died out within a few days. This is mainly due to the overarching influence of environmental issues in the every day life. Dakshina Kannada in recent years is undergoing environmental stress due to large-scale industrialisation. This industrialisation has brought to surface such issues as the carrying capacity of the district, ecological crises, displacement and rehabilitation, pollution, etc. This has served to temporarily shift the discourse from communalism to development and environment until now.

Communal riots broke out on December 29, 1998 in Chokkabettu in Surathkal, 30 kms north of Mangalore when hundreds of miscreants pelted stones and attacked houses of innocent people. It all started on a trivial issue. A scrap seller from the minority community was alleged to have stolen scrap from a house. The house owner interrogated and took him to task. This was all it took for the situation to snowball into riots. This incident was precipitated by a couple of other incidents – in fact the communal tension was building up in this district almost three months earlier. One incident which received the national attention was the attack on the Evangelical Church – a protestant church – in Kulai in November. It is a small church situated in the midst of a housing colony. Although a sinister campaign was carried out that the church was involved in proselytisation, however, the attack was part of the larger attack on the minorities, principally Christians elsewhere in India. Incidentally the people who were involved in vandalisation of the church were also involved in the subsequent communal riots in the surrounding areas. The second incident was the eve teasing of a college girl allegedly by a Muslim boy. The subsequent police action of arresting those who were involved in brutally attacking the boy triggered off a major controversy. Road blocks were resorted to demanding the release of the arrested. A third incident was the act of tearing off a banner announcing a yakshagana performance and its subsequent stoppage. However these were all contributing factors triggering the riots.

The communal tensions soon spread to other places. In Surathkal it spread to several villages: Krishnapura, Hosabettu, Thandabailu, Kana, Katipalla, etc. It even spread to Mangalore city and other neighbouring taluks like Puttur and Bantwal. In this incident the government report claimed the death of eight people, however an independent enquiry put the toll at 16. Of the eight, six were Muslims and two Hindus. The same government report documented the attack or destruction of 165 houses/business establishments in which a majority (98) belong to people of minority communities and 67 to people of the majority community. Four religious institutions of the minorities were also attacked. The government estimated that property worth Rs 50 lakh was destroyed which is however an underestimate according to some reports. However more than 100 people were injured in stabbings and attacks. About 70 rioters were arrested.

This communal riots which petered out within a week is peculiar in many ways. First, most of the rioters had earlier participated of engineering communal riots. In fact, they had been involved in the Idgah incident in Hubli, the Bababudanagiri incident in Chickmagalur and also in the vandalisation of church more recently. Rumours played a dominant role. These rumours were pertaining to "increasing police atrocities", "employment of or arrival of outside forces", "rape of women", and "attack and desecration of religious places" These rumours were precipitated by the generation of a fear psychosis that the communities were either being marginalised or were under threat. In addition, the riots were not confined to urban areas alone; rather they spread to rural areas especially those villages which are close to national highway. In a majority of cases looting was confined to petty shops, like vegetables, grocery, painting shops, telephone booths, cloth shops, etc. The rioters cared little for the curfew imposed in these areas showing the callous and biased attitude of the police and the administration. The administration knew about the tensions developing but did nothing to contain them. The number of rioters varied between seven and 200 and they appeared to have

selected those houses/shops which were in isolated areas where not much resistance was expected. While attacking, the rioters used different tactics. They would divide themselves into four groups, with one group clashing with the police and other three systematically attacking innocent people. The rioters did not target any particular age group or sex or weaker sections among the communities. In addition they did not adopt 'rape' as a strategy to further vitiate the communal riots or atmosphere. In many places looting or destruction was carried out in broad daylight with the knowledge that their identities would be known. The riots were also used as a means to solve personal problems of individual eviction such as tenants, non-payment of dues, or business rivalry. Most of the deaths occurred either due to police firing and or stabbing. Most interesting are the categories involved in the communal riots. The majority of rioters came from backward castes, partly dominant caste and ethnic Muslim group called Bairys or Mopillas.

Social Change in Coastal Regions

There are reasons why Dakshina Kannada district, and other coastal districts like Udupi and Uttara Kannada have become communally sensitive districts. This has to be located historically, especially the way the coastal best has developed over the years and the way it has provided spaces for new categories to emerge. Historically the coastal belt was part of Presidency areas and thereby it benefited from the colonial administration even though it was at the periphery of colonial rule or administration. Most of tho forces of modernity entered this district through its linkages or interaction with colonialism This often reflected in the de-territorialisation of the population to far off places in search of jobs or employment; it also reflected in the inauguration of new industries like tiles, cashewnuts and fishing. Interestingly colonialism in the agrarian structure introduced the famous Thomas Munroe doctrine of Ryotwari system which rather than destroying, reinforced the feudalism. In other words colonialism while introducing capitalism also retained or perpetuated feudalism or pre-capitalism, leading to uneven, lopsided development in agriculture. It was during the colonial period, and subsequently uptil the late 1970s, that the land was controlled by dominant castes like bunts or nadavas; the economy or the business was in the hands of upper castes mainly konkani brahmins who had earlier escaped from the Portuguese persecution; and finally social institutions like education under the control of Christian konkanis. In other words there was not much of the contradictions among these categories either for capturing the market or the economy. Each had its own defined and clear-cut space to operate. However, the contradictions existed at a different level – it was growing from below, especially between backward castes who were operating as tenants of the dominant castes; and it was often manifested in the form of demanding effective implementation of land reforms, abolition of landlordism, tenancy rights, reduction of rents, etc. Meanwhile the conditions of Bairy community was not much different from the backward castes except that the former was operating as an autonomous group as they were not linked to land and were carrying on petty businesses.

However, the coastal belt underwent a complete transformation after 1970s with the effective implementation of land reforms, the Gulf boom, the establishment of a large number of new industries and the expansion of banking brought to centre stage new issues. This provided spaces for a large number of new categories belonging to different communities to compete with each other. Land reforms while destroying the popular 'Guttenar' system of the dominant caste released a large number of backward castes from dependency. This also had other effects: a majority among the dominant caste who found their economy collapsing opted to move away to far off places like Mumbai wherein they established the popular 'Udupi hotels', although the linkages with their native place were retained or perpetuated through cultural reproduction of symbols, signs and festivals like 'Naga Mandala', 'Bhoota Kola' and 'Kambala'. Those who were left behind also entered into new ventures like banking and other businesses including the philanthropic activities like education. This too closed the option for the backward castes to compete with them – they had to contend with small businesses and small markets. However, the larger challenges came from the Bairys who were not only entering into the small businesses but also into the bigger businesses – especially for the backward castes like billavas/poojaris and mogaveeras (a community of fishermen) as well as to the dominant caste like bunts. In other words the communal riots has to be seen in the context of larger emerging tensions among caste and community groups.

Bairys (a name derived from 'bepari' or merchant) are relatively new entrants in the larger economy. They are an ethnic Muslim group whose mother tongue is a curious mixture of Malayalam and native dialects. They have retained and perpetuated their distinguishing cultural practices Most interesting is the contribution of this ethnic group to the tradition of Dakshina Kannada, mainly to 'Bhootaradhane' (worshipping the dead). One among them is popularly called 'Ali Chamundi Bhoota' and another is 'Bobbarya Bhoota' – the former is well known among castes like the billavas/poojaris, mogaveeras. The Bairys' entry into larger economy was prompted by the Gulf boom of mid-1970s and the new industrialisation. The Gulf boom pumped the money into new businesses. Paradoxically the Gulf boom also created conditions for the emergence of neo-communitarian categories (see Muzaffar Assadi 'Communal Riots: Communal or Communitarian', *EPW*, October 1, 1997). Meanwhile cultural constructionist also came to the centre stage, mainly in the literary field (Boluvar Mohammad Kunhi, Sara Abookkar Fakir Mohammad Katpadi, etc) who however had little role to play in the larger politics of the community except that their arguments are often appropriated by the hindutva forces to show up the weaknesses of the community. In fact in the communal riots the active role was played by the neo-communitarians both to define the 'soft target' and to define the riots as an "attempt to eliminate or marginalise the community including their economy". In addition they have been asserting themselves as a community in conferences and interacting participating in politics by demanding reservation benefits for their children, establishing an academy for Bairy language and attempting to create a recognising distinct identity for Bairy culture and tradition, etc.

In Dakshina Kannada the Bairy community comprised 15 per cent of the total population, of which 90 per cent of them have settled down in Mangalore taluk (1,33,554), followed by Bantwal (1,10,320), Puttur taluk (75,376) and Belthangady taluk (62,930). These are the taluks prone to communal riots. In other taluks like Udupi (27,751), Karkala (12,775) and Kundapur (7,588) they are

numerically in a small group. In Mangalore taluk alone, of which Surathkal is a part, they constitute 38.43 per cent of population. In addition, there are 74,860 Bairy households in the whole district, with each household having an average of seven children (*Bairy Verte*, January 1, 1998). The numbers are important for the reasons that they helped the construction of a discourse that the community's population is multiplying at the cost of majority community's. Moreover in 51 gram panchayats Bairys have more than 500 households. In Mangalore taluk alone there are 15 gram panchayats where they have more than 500 households. This is one of the reasons why the communal riots spread to the rural areas like Katipalla, Kana, Kulai, Munchu, etc, in Surathkal. Some of the villages are resettlement areas for the people displaced due to industrialisation. Earlier these areas saw the environmental movements growing against the paltry compensation, unfulfilled promises, displacement, non-absorption in the industries, etc. Here the images of displacement and deprivations are very strong. The same areas have now become communally sensitive areas.

This was further compounded by the general economy of the community. Nearly 3.6 per cent of population work as coolies; 27 per cent are engaged in beedi industry; 3.3 per cent as drivers; 15-20 per cent involved in petty businesses, including 10-12 per cent in textile and grocery; 15 per cent in middle level businesses which includes hotels, spice, cashew or betel-nut economy; and 0.1 per cent involved in big businesses or the larger economy linking to international capital. Interestingly 70 per cent of these categories are located in Mangalore alone. Furthermore nearly 10 per cent have settled down in the Gulf and 30 per cent of population have spent more than 10 years in west Asia. According to 1996 statistics individual per capita income stands at Rs 3,860, much higher than of other backward castes. The average household income per annum is Rs 26,401. This is once again higher than the average household income of other communities. Neo-communitarian identity once again reinforced with the construction of a large number of religious places, including mosques, madrassas and 'yuvaka madala'. In Dakshina Kannada district there are 503 registered mosques, 703 madrassas and 713 yuvak sanghas. All these helped in constructing a discourse about "relative deprivation and marginalisation" of the community. For example mogaveeras – a fisher community – suddenly found that entering into the larger market was not an easy one, as the market was already being controlled by the Bairys. Similarly also in other businesses or markets like timber, cashew, spice, betel-nuts, etc. The majority of those involved in the communal riots belonged to these upwardly mobile categories and castes. Others also participated in the riots. Their participation was part of the larger politics of consolidating their communal identity. There was a growing apprehension that backward castes including the minorities were once again shifting their political loyalties to the centrist forces, namely, Congress. A complete division or conflict between the backward castes and the minorities was but essential to the communal forces, once again to reaffirm their hold over the coastal belt. As intense backlash from the minorities (or from the centrist forces) was desired to realising the social categories for communal politics. This is why minorities mainly Muslims and Christians became 'soft targets' of the communal forces (led by the Sangh parivar). Nonetheless, with the increasing potentiality for development, competitive economy and the larger linkages, the recurrence of communal riots in this coastal belt is more a possibility than in earlier decades.

[Thanks to Laxminarayana, the PUCL group and a host of victims of Surathkal.]

Did India Give the World Its First Customs Tariff?

C Satapathy

A closer examination of Kautilya's 2,300-year old treatise, the Arthasastra *for an understanding of the tax structure of the day reveals interesting parallels with currently prescribed valuation principles and practices.*

WRITING in the *CCC News* in its 40th anniversary issue (January 26, 1993), H Asakura, the then director of Nomenclature and Classification in the Customs Co-operation Council (since renamed as the World Customs Organisation) at Brussels points out that the customs tariff of Palmyra in AD 136 provided different rates for different commodities, thereby ensuring the birth of customs tariff and the customs tariff nomenclature. Asakura, who has a special interest in the history of customs and tariffs, has traced the history of customs tariff of Palmyra in some detail. Palmyra, a beautiful Oasis city in the Syrian desert was also known as the 'bride in the desert' and was granted the exceptional privilege of collecting municipal customs duty by the Roman emperor Hadrianus. The customs tariff of Palmyra was a part of the municipal tax law and was engraved on a stone in Greek and Aramaic. Some of the passages quoted by Asakura are reproduced here:

> The person in charge of the customs farm himself shall levy a duty in respect of each camel-load, three denarii for each camel load entering Tadmore (Palmyra), and three denarii for each camel load leaving Tadmore
>
> Wool dyed purple. For each fleece imported or exported, three denarii.
>
> Per donkey-load of aromatic oil in alabaster jars seven denarii at importation and exportation.
>
> For salted goods carried by donkey, the person in charge of the customs farm shall collect three denarii per load at importation and exportation.

This tariff basically provided for assessment of goods either by camel-load or donkey-load, the specific rates being three denarii for most items and seven denarii for costlier aromatic oil. The greatest merit of such a tariff must have been its simplicity which was easier to administer.

It was Asakura's article that prompted the present study of Kautilya's *Arthasastra* insofar as it relates to customs and excise taxation. Few may know that for centuries Kautilya's classic written 2,300 years ago around 300 BC was not available to the scholars. It was only in 1909 that R Shamasastry published the text of *Arthasastra* from a copy of the manuscript received by him from a Tanjore pandit. There are two English translations of the work, the first by R Shamasastry in 1915 and the other, an extremely valuable and thorough translation of various available manuscripts, by R P Kangle in 1963. A more recent translation by L N Rangarajan of the Indian foreign service has also generated considerable interest in this classic all over again.

For comprehending the tax structure in Kautilya's days, it is necessary to have a brief idea about the organisation of the economic activities of the times. Agriculture ('krsi'), cattle-tending ('pasupalya') and trade ('vanijya') were the three main aspects of the economy ('vartta', a word derived from 'vritti', livelihood) (1.4.1). Agriculture yielded the most important part of the state revenue in the form of 'sita', i e, produce from crown lands (2.15.1) and 'bhaga' or 'sadbhaga', i e, one-sixth of the produce of other lands (2.15.3). If land was sold, the state received sales tax (3.9.5-6). Besides the land tax, there was a water rate ('udakabhaga') (2.24.18) with exemption provided for new constructions and renovation of tanks (3.9.33). Forests and forest produces entirely belonged to the state.

Cattle-tending was another important vocation which the state nurtured. But by way of revenue, it seemed to contribute much less compared to agriculture and trade. Only direct income was from the stateowned herds. However, in times of emergency, state could demand one-tenth of the cattle, one-sixth in the case of goats and other small animals and as much as one-half in the case of fowls and pigs (5.2.27).

Trade was considered to be a very important economic activity. All trade was state-controlled with the superintendent of trade ('panyadhyaksa') in charge. He was to fix prices of commodities taking into account investment of capital, interest charges, duties paid, rent, etc (4.2.36). A profit of 5 per cent on indigenous goods and 10 per cent on foreign goods was to be allowed with provision for heavy fines for exceeding these limits (4.2.28-30). The panyadhyaksa was also to prevent slump in prices by market intervention (4.2.33-35). A superintendent of markets ('samsthadhyaksa') was to look after the customer's interest by preventing frauds in weighing, supply of inferior goods, etc (4.2.3).

Apart from private trade, state trading was extensive. State goods ('rajapanya') included indigenous ('svabhumija') as well as foreign ('parabhumija') goods. Indigenous goods were to be sold at one place, foreign goods at different centres. The panyadhyaksa was to arrange for the export of state goods. He had to consider expenses of journey, duties, and prevailing prices at different places and determine whether any profit could be made. He also had to consider the possibility of bartering state goods with foreign goods ('panyapratipanya') (2.16.18-24).

Import of goods from foreign lands was to be encouraged. Exemptions from duties could be considered to shippers and caravans bringing foreign goods, so that they might be enabled to make a profit. Immunity from suits in connection with money matters could also be considered to foreign traders (2.16.11-13)

Provision of routes for trade was an important state activity. Kautilya favoured land routes to waterways (7.12.18-20) as well as the southern route to the northern as the same was more profitable and brought in gold, pearls, diamonds and conch-shells (7.12.22-24).

The officer at the frontier post was to collect a kind of road cess called 'vartani'. In return he had to ensure safe passage from the frontier to the custom house inland. The rates of vartani were as follows: (a) one pana and a quarter for a cart-load of goods; (b) one pana for a single-hoofed animal; (c) half a pana for cattle; (d) quarter pana for small animals; and (e) one masaka for a shoulder-load (2.21.24).

He had to make good if anything was lost on the way (2.21.25). As such, the road cess was a kind of insurance against any loss on the way. The frontier officer had to send on the caravan coming from the foreign land to the custom house after appraising the value of the goods and giving an identity pass and stamp on the goods (2.21.26).

It would seem that the tariff for road cess was fixed on a rational basis and covered cart-load, animal-load and head-loads of merchandise. In addition to road cess 'ativahika' or escort charges (2.16.18, 2 28.25) were also prevalent perhaps for providing armed escort from the frontier to the capital. When goods were brought by waterways, they were to pay duty at the ports and also rent in case of using boats maintained by the state (2.28.3-5).

When ferries operated on rivers forming the boundaries between two states, the recovery of customs duties, road cess and convoy charges from foreign merchants was to be made at the ferry wharf (2.28.25).

The state also controlled the industrial activity and mining through state officials such as superintendents of gold and silver ('suvarnadhyaksa'), of other metals ('lohadhyaksa'), of precious stones ('khanadhyaksa'), of textiles ('sutradhyaksa'), of salt mines ('lavanadhyaksa'), etc. Manufacture, sale and inspection of standardised weights and measures and balances was considered very important and was in the charge of pautavadhyaksa.

As in the case of any modern economy, great importance was attached to currency Manufacture of coin was in the charge of laksnadhyaksa while the 'supadarsaka' (the inspector of coins) looked after the circulation of currency. Silver coins were in the denominations of 1 pana, 1/2 pana, 1/4 pana and 1/8 pana each containing 11 parts of silver, 4 parts of copper and 1 part of some hardening alloy Copper coins were in the denominations of 1 masaka (1/16th pana), 1/2 masaka, 1 kakani (1/4 masaka) and 1/2 kakani each containing 3 parts of copper and one part of hardening alloy (2.12.24).

Commodity Taxation

There was a definite rule that goods were not to be sold at the place of their production. Fines were prescribed for purchasing metals, etc, directly from the mines, grains directly from the fields, or flowers and fruits, etc, directly from the gardens (2.22.9-13). The object was obviously to control trade so that duty was not evaded. Duties were to be collected at the city gates, each of which was to have a custom house or toll house ('sulkasala') with four or five officers under the charge of the collector of customs and tolls ('sulkadhyaksa'). The collector's duty was to establish the custom house and the flag facing the east or the north in the vicinity of the big gates of the city (2.21.1-2). The frontier officers were to direct imported merchandise to the custom house after duly stamping the same. The officers at the city gates were to record the particulars of the merchants and their merchandise and verify the stamp. For goods without a stamp, the fine was double the duty, for forged stamp eight times, etc (2.21.3-6).

Traders were to declare the quantity and the price of the merchandise at the foot of the flag of the custom house "who is willing to purchase these goods, so much in quantity, at this price?" (2.21.7). After three proclamations, the trader should give it to those who asked for it. In case of bidding the higher amount along with the duty went to the king (2.21.8-9). If for fear of duty, a merchant understated the quantity or the value, the excess was to be confiscated or the merchant would pay a fine equal to eight times the duty. Similar penalties were prescribed for showing a sample of low value or for concealing high-valued items by low-valued items in a package (2.21.10-12). If a trader increased the price beyond the actual price for fear of competition from rival traders, the king would receive the enhanced amount or double the duty. If the customs officials assisted the traders in concealing their offences, eight times that amount would be penalty on them (2.21.13-14). Fine for going past the flag of the custom house without paying duty was eight times the duty (2.21.16) and secret agents were to detect such evasion (2.21.17). Thus, there was provision to curb both under- as well as over-valuation. The duty was to be imposed on the real actual value. Asakura rightly points out that the valuation practice in Kautilya's time was in conformity with the spirit of GATT Valuation Principles requiring the actual value to be the basis of customs value.

The Tariff and the Exemptions

After enumerating the duties of the collector of customs and tolls, establishment of custom house or toll house, manner of valuation, etc, in book 2, chapter 21, Kautilya proceeds to discuss the tariff in the next chapter 22. The title of the chapter is 'sulkavyavaharah'. Shamasastry has translated the title as 'Regulation of Toll Dues' whereas Kangle's translation reads as 'The Tariff of Duties and Tolls'. In the beginning, the general nature of the levies have been described: (a) 'Bahyam avyantaram cha atithyam' (2.22.1). (b) 'Niskramyam pravesyam cha sulkam' (2.22.2).

Shamasastry has translated thus:

Merchandise, external (bahyam, i e, arriving from country parts), internal ('abhyantaram', i e, manufactured inside forts), or foreign ('atithyam', i e, imported from foreign countries) shall all be liable to the payment of toll alike when exported ('niskramya') and imported ('pravesyam').

For this construction, 'cha' should have come after atithyam. Kangle feels atithyam probably referred to a kind of internal tax or excise duty on goods (internally traded between city and country) and sulka refers to a customs duty on foreign trade, i e, on goods imported and exported. Kangle also concludes that the rates for excise and customs duties did not differ. The tariff was as follows: (1) On goods coming in the duty shall be one-fifth of the price (2.22.3); (2) On flowers, fruits, vegetables, roots, bulbous roots, fruits of creepers, seeds, dried fish and meat, duty is one-sixth (2.22.4); (3) On conch-shells, diamonds, gems, necklaces of pearls and corals, valuation and fixing of duty is to be done by experts in the line acquainted with the time, cost and finish of such production (2.22.5); (4) On fibrous garments ('ksauma'), cotton cloth ('dukula'), silk yarn ('krimitana'), armours, sulphate of arsenic ('haritala'), red arsenic, antimony, vermilion, metals of various kinds, ores, sandalwood, aloe, spices, garments, skins, ivory, bed spreads, coverings, silk cloth ('krimijata'), and on products of goats and rams, duty is one-tenth or one-fifteenth part (2.22.6); and (5) On clothes ('vastra'), four footed and two footed creatures, yarn, cotton, perfumes, medicines, wood, bamboo, barks, leather goods and earthenware, grains, fats, sugars, salts, wine, cooked food, etc, duty is one-twentieth part or one-twentyfifth part (2.22.7).

The translators, perhaps being unfamiliar with the working of a tariff have interpreted as at (1) above that a flat rate of 20 per cent *ad valorem* duty was chargeable on all imports. This does not appear to be correct. Firstly, there is no mention that the other rates that follow are only for exports or for excise duty. Secondly, (3) above clearly provides that for gems and jewellery no fixed rate is provided but value and duty for such items are to be determined by jewellery experts. It is significant that the rates mentioned at (2),(4) and (5) above range from 4 per cent (one-twentyfifth) to 16.67 per cent (one-sixth) and are all lower than the general rate of 20 per cent (one-fifth) mentioned at 1 above. As such, the only logical interpretation is that (1) above fixes a general tariff rate of 20 per cent *ad valorem* duty on all foreign goods and all country goods entering the city through the customs gate. About 50 items provided with lower duties specifically at (2),(4) and (5) above are to be taxed accordingly at lower rates. Goods specifically not mentioned are to be charged at the higher general rate of 20 per cent thus ensuring that no item entering the city gates from outside escape the levy on account of not being specifically enumerated.

As for export duty and excise duty on city goods going out through the customs gate in the absence of a general rate, only about 50 items specifically enumerated would be levied the duty at the same rates as in the case of goods entering the gates. The rationale for such a scheme appears to be in line with many modern tariff schedules that levy duty on all imported goods but only on specifically enumerated export goods. For gems and jewellery, a general duty rate of 20 per cent would obviously be too high and hence they are to be taxed on expert appraisement in each case.

Thus interpreted, the Kautilyan tariff seems to be a detailed tariff for import, export and excise duty purposes, classifying the products. Moreover, the levy being proportional to the value, it appears to provide a very progressive tariff structure. Moreover, it is at least 450 years older than the tariff of Palmyra and perhaps the oldest tariff of the world.

Kautilya's tariff also had another feature of modern tariffs as it provided exemptions for specified goods. It exempted: (i) goods intended for marriage, (ii) marriage gifts accompanying the bride, (iii) goods intended as gifts, (iv) goods required on the occasion of a sacrifice or a ceremony or a birth, and (v) goods used in various rituals like worship of the gods, tonsure rites, initiation for Veda study, hair-cutting rite, consecration for a vow, etc (2.21.18). This was accompanied by punishment for false declaration. There also appeared to be provision for levying a gate duty, a kind of surcharge on duty at the rate of one-fifth of the duty but the same could be remitted if the goods were of benefit to the country (2.22.8). Kautilya's treatise was not for any particular Indian state but a code that took into account the practices followed in different states in the subcontinent. This would perhaps explain mention of two nearly equal duty rates at (4) and (5) above.

[A version of this article was earlier published in the January-March 1993 issue of the in-house magazine *Indian Customs and Excise*. For references from the *Kautilya Arthasastra* see R P Kangle (1965), Motilal Banarasidas Publishers, Delhi, 1997, reprint.]

Money and Finance in the Indian Economy

Sagar Koparkar
Manas Paul

The progressive integration of India's financial markets with those worldwide has implications for both traditional concerns such as inflation and growth, the distribution of income and the value of the rupee as well as for new areas of enquiry such as the state of the financial markets and links between the financial and real sectors in an era of highly mobile capital. Report on a conference.

AS India becomes more and more of an open economy with a steady rise in the share of GDP originating in the traded good sector and its financial markets get more and more integrated with financial markets worldwide, it becomes necessary to understand the implications of such changes. There are implications both for traditional concerns such as the rates of inflation and growth, the distribution of income, the value of the rupee as well as for new areas of inquiry such as the state of the financial markets and links between financial and real sectors in an era of highly mobile capital. To bring together researchers actively working on these ideas IGIDR hosted a conference on 'Money and Finance in the Indian Economy' in early December. The conference was inaugurated by C Rangarajan who also gave a keynote speech. The function was presided over by Bimal Jalan.

Rangarajan delivered a comprehensive talk on the controversial subject of monetary policy. Monetary targeting is controversial in the context of striking a balance between price stability and high growth rate. Empirical and theoretical literature says that in the long run the objectives of price stability and growth do not necessarily conflict. In fact, price stability is a means to achieve sustained growth and avoid speculation in investment decisions. Price stability is also needed for exchange rate stability and for keeping nominal interest rates close to world levels.

Rangarajan warned that the effect of investment financing by money creation is significant only in the short run. In the long run, it can have an adverse inflationary outcome. This could be worrisome as it would lead to deterioration in the current account deficit. Rangarajan stressed the need to identify the level of inflation at which the adverse consequences really begin to set in.

In his view, money supply should be regulated keeping in view the expected increase in real output and the acceptable order of increase in prices. This is against narrow monetarism that money supply should grow at a certain fixed rate irrespective of the real rate of growth. Rangarajan made some remarks on targeting interest rate as practised in most industrialised countries. Manipulation of the interest rate in these countries does not have the objective of determining the level of the interest rate but controlling prices. So the interest rate could become an intermediate variable as the inflation rate comes down and fluctuates in a narrow range. He also discussed the salient aspects of monetary policy during his tenure as RBI governor.

Exchange Rates and Currency Crises

Sugata Marjit and Byasdeb Dasgupta in their paper 'Exchange Rate and Exports from India: A Fresh Look at the Official Statistics' tried to explain the phenomenon of immediate exports growth after liberalisation and its ultimate slowing down. They argued that the immediate increase in exports after the liberalisation process started more due to the increase in export declaration, whereas exports were underinvoiced before due to the presence of high black market premium.

In their paper 'Towards a More Rationál IMF Quota Structure: A Tentative Partout in the Direction of Creating a New Financial Architecture', Raghbendra Jha and Mridul Saggar, questioning the existing IMF quota formula, discussed the need to review it on the basis of giving due weights to the size of the economy along with the efficiency parameters. They suggested three alternative sets of formulas. The first was based on determinants of size variables and of the current account variables for international trade and payments; the second on formulas where macro-economic stabilisation parameters were introduced to capture member countries' relative positions in respect of lowering inflation and fiscal deficits; and the third set incorporated capital flow as an additional determinant. Their calculations showed that India's rank can improve to 5th from the present 13th according to the 10th and 11th General Review of IMF Quotas.

Partha Sen's paper 'Non-uniqueness in the First Generation Balance of Payments Crisis Models' showed that Paul Krugman's model of a speculative attack ('A Model of Balance of Payments Crisis', *Journal of Money, Credit and Banking*, Vol 11, pp 311-32) is riddled with multiple equilibria, i e, the time of attack is not uniquely determined. A continuum of paths to a floating regime exist. The only difference across periods is the amount of foreign exchange left with the central bank and hence the proportion of foreign exchange reserves that will back the money supply under a floating rate regime. How much reserves the central bank holds or is able to borrow is not germane to the issue of collapse (as long as the fixed exchange rate is expected to collapse eventually).

The central bank may hold 'large' stocks of reserves but not 'enough' to maintain a fixed rate regime.

Macro and General Equilibrium Models of the Indian Economy

C W M Naastepad presented a multi-period real-financial CGE model for India. The model goes beyond the extant literature by introducing credit for working capital as well as investment and allowing for credit rationing with real and financial market conditions being determined endogenously. The paper identified two supply constraints: shortages of credit and of infrastructure affecting growth.

In a theoretical set-up the paper 'On Interest Rate Policies' by Romar Correa examined the relative merits of the stabilising role of monetary policy in two cases. First, the monetary authority operates the discount window. Second, the central bank enters as a player with the interest rate on government paper as a strategy. The paper confirmed evolutionary stability only in the second case.

The paper entitled 'An Econometric Model for India with Emphasis on the Monetary Sector' by T Palanivel and Nobel laureate L R Klein had three objectives: first, to build a monetary sub-sector model of India; second, to estimate the model with pre- and post-reform data; and third to evaluate the impact of changes in trade, fiscal and monetary policies on output, inflation, trade flows, financial flows, structure of interest rates and exchange rate for the period 1997-98 to 2001-2002.

FDI Flows and Exchange Rates

Manas Paul in his paper 'Some Findings on the Issue of Real Exchange Rate Targeting in India' studied the long-run behaviour of the Indian real exchange rate in a cointegrating VAR framework over the period 1964-94. The study showed the exogeneity of real exchange rate to any deviation from the long-run cointegrating relationship amongst real exchange rate and its fundamentals. This indicates the possibility of real exchange rate targeting. Endogeneity of government consumption to the cointegrating vector suggests that government consumption should not be used to attain internal and external balance concurrently.

In the paper 'Monetary Policy for Sustainable External Value of Rupee', B M Jani stressed the importance of RBI intervention in the foreign exchange market to maintain the real exchange rate at an appropriate level. C S Despande in his paper 'The Role of Foreign Direct Investment in Indian Economy' discussed the relevance of Foreign Direct Investment for India.

Financial Repression and Liberalisation: Theory and Practice

E D'Souza in his paper 'Financial Intermediation and Liberalisation under Asymmetric Information' discussed the importance of dealing with micro-economic problems associated with the institutional weakness of the financial system, prior to liberalisation of interest rates on government paper. Mahendra Pal in his paper 'Financial Development in India: An Empirical Test of the Mckinnon-Shaw Model' utilising 2SLS and OLS techniques found statistically significant results in the support of McKinnon's complementarity hypothesis in India, using time series data for the period 1970-93. G Darbha in his paper entitled 'The Effects of Financial Constraints on Inventory Management' examined the sensitivity of inventory holding behaviour of different types of firms to changes in internal finance over different phases of the business cycle. It showed that the cash flow effects are significant for smaller firms than for larger ones and the difference is more pronounced during the low growth phase.

Money Supply, Demand and Links with Fiscal Sector

The paper by K Chaudhari, S Chattopadhyaya and S Ashra titled 'Deficit, Money and Prices: The Indian Experience' found unidirectional causality from price to M3. Thus money is endogenous and prices are exogenous. The second paper 'On the Stability of Demand for Money in a Developing Economy: Some Empirical Issues' by B K Pradhan and A Subramanian concluded that both narrow and broad measures of money exhibit long-run relationship with real income and rate of interest in India. Thus stabilisation policy should aim at both broad and narrow money with a stable demand function, for bringing up price stability in the economy. The third paper 'Does Money Supply in India Follow a Mixed Portfolio-Loan Demand Model?' by D Rath examined the endogenity of money supply. The paper distinguished among three competing models of the money supply process, namely, pure portfolio approach, pure loan demand approach and mixed portfolio-loan demand approach. The author found that in India the mixed portfolio-loan demand approach best described the money supply process.

Credit and the Monetary Transmission Mechanism

The paper 'Monetary Transmission Mechanism: The Credit Channel Hypothesis Revisited' by H Mukhopadhyaya argued against conventional method of testing the 'credit channel' hypothesis. The paper diverged from the earlier work by considering only the credit-supply constrained firms. His study of Indian industry documented three major findings. First, bank credit does indeed influence inventory accumulation. Second, the size of external finance premium depends on the financial conditions of firms. Third, bank-dependent small industries suffer most during a period of quantitative credit control.

The paper 'Money, Credit and Exogeneity: A Multivariate Cointegration Approach' by S Koparkar introduced credit for the first time in a money demand equation for India and examined the long-run relationship between bank credit, money supply, foreign exchange reserves and industrial output over 1952-96. Causality tests suggested that money is endogenous and thus monetary policy may be accommodative.

The third paper titled 'Dynamics of Money, Output and Price Interaction: Some Indian Evidence' by S Dutta Roy and G Darbha modelled the dynamic interaction between money, output and prices in a structural vector auto regression framework. The study had two major findings. An increase in money/credit supply leads to increase in output and prices in the short run and only prices in the long run. A non-accommodative monetary policy is ineffective in controlling inflation even at the cost of substantial output losses.

East Asian Crisis: Lessons for India

The paper 'The East Asian Crisis of 1997: The Role of Structural and Proximate Factors' by S Gokarn tried to unify extant explanations of the east Asian crisis. The paper argued that the crisis can indeed be interpreted as a consequence of the growth strategy. The paper linked up the proximate (or how) factors and structural (or why) factors associated with the crisis. The main lesson for India is the requirement of rapid development of asset markets with new financial instruments allowing the banks to hedge their portfolios. The second paper 'East Asian Crisis: Lessons for Indian Banking' by P Mitra discussed the East Asian Crisis more as a banking crisis and less as a currency crisis.

Asset Markets, Market Microstructure and Financial Equilibrium

The paper 'Real and Financial Sector Interaction under Liberalisation in an Open Developing Economy' by A Goyal and S Dash showed that a passive monetary stance would lead to a monetary tightening and rise in interest rates. The rate of inflation may fall, but there could be large fluctuation in interest rates and equity returns, which can harm the output in

medium term. The paper 'The Status of NBFCs in India' by B Gayathri argued that healthy and growing non-banking financial (NBF) sector is necessary for promoting the growth of an efficient and competitive economy provided NBFCs improve degree of financial intermediation.

The paper 'Integration and Price Discovery in Indian Stock Markets' by R Jha, C Krishnamurthy and H Nagarajan examined price discovery and integration of the various stock markets in India. Their results indicate that markets are integrated in the long run, thus regional stock exchanges should be promoted in the national interest of widespread trading. The authors recommended better information dissemination between markets to avoid arbitrage, strengthening competition in securities to reduce fear of price rigging, trading of medium-size stocks on regional stock exchanges with centralised order booking. Also, strengthening of interaction between stock exchanges with sharing of order flow might have the benefit of widening and deepening the market.

M Thiripalraju and T P Madhusoodanan in their paper 'Commodity Futures Prices in India: Evidence on Forecast Power, Price Formation and Inter-Market Feedback' examined the efficiency of price formation in the Indian commodity futures markets of peper and castorseeds. T Waghmare in his paper 'Volatility in Indian Stock Markets: A Study of Badla and Short Sales Restrictions' discussed the impact of banning short sales and badla transactions by the Indian regulatory authorities on destabilising volatility on the Bombay Stock Exchange. He found that though the ban on short sales did prove effective in reducing volatility due to 'noise' the same was not true in the case of badla transactions.

Ajay Shah in his paper 'Improved Methods for Obtaining Information from Distributed Dealer Markets' offered a market microstructure interpretation of the information obtained by polling dealers and proposed improvements for many elements of the polling process. The paper provided empirical evidence based on polling in India's call money market about this trade-off. The paper 'Natural Experiments with Price Limits' by Ajay Shah, Susan Thomas and G Darbha studied a set of natural experiments where price limits were changed on India's National Stock Exchange (NSE). Their result suggested that a combination of liquidity and volatility influence the impact of price limits upon prices.

Every paper was the subject of intense discussion, both by a formal discussant and from the floor. The participants and audience came away with the conviction that considerable and exciting work on money and finance is being done in Indian universities/institutes. A conference such as this by bringing together some of these researchers will surely lead to considerable cross fertilisation of ideas. During the valedictory session, it was felt that the money and finance conference should become a regular feature at the IGIDR.

Exposing Violence against Women

A Campaign in Uttar Pradesh

Nisha Srivastava

Vanangana, a women's group, recently organised a campaign against domestic violence in Banda district in Uttar Pradesh. To provoke the women themselves to break their silence on this issue, Vanangana, in 30 villages, performed a play based on a real incident and followed it up with discussions. The campaign proved effective in creating awareness.

BANDA district in the Bundelkhand region of Uttar Pradesh has made headlines because it is home to the dreaded dacoit Dadua and his gang. The crime that escapes, notice is domestic violence against women. The industrial and economic backwardness of this region – one of the most backward in the state – provides fertile soil for such activities. The parameters of women's progress in the region are lower than the already abysmal state averages. Female literacy is 23.9 per cent and the sex ratio (number of women per 1,000 men) is 846 compared to the state average of 25.3 per cent and 879 respectively. No figures, however, can reflect the plight of women or the social and economic constraints that shackle them.

It is in this arid, poverty-stricken and dacoit-infested district that Vanangana, a women's group, has been working for the empowerment of rural women. In an area where water is a perennial problem, Vanangana has broken the stereotype of the male mechanic and has trained women to become hand-pump mechanics. Self-help groups have been organised to extricate women from the clutches of rapacious moneylenders, and to increase their earnings by helping them to acquire skills.

Even as Vanangana members mobilised women on these issues, there was one issue that loomed large in many gruesome forms. Domestic violence was an issue that impacted on most women but one which remained wrapped up in a shroud of silence. Sometimes the shroud was not just metaphorical. Many women were killed, and several others driven to suicide in increasing incidents of domestic violence. In Banda district alone, in the last one year, the number of reported dowry deaths was 21 and suicides seven, which was the highest ever. Yet very few of the total cases were reported and even fewer resulted in any convictions. In no case was there any public outcry.

"Domestic violence is so all pervasive, it just cannot be ignored any more. Society, the police, the administration and the family are all guilty in this conspiracy of silence. We decided to start an all-out campaign and take the sensitive issue of domestic violence head on," says Huma Khan the co-ordinator of the campaign. Their first task was to visit the villages and investigate the cases in which women had been found dead in unnatural circumstances in the last one year. They made a list of 30 such villages. They had worked in some of the villages, others were new to them.

"Each village had one or more chilling story of a women's murder or suicide. But the greater tragedy was the silence on the issue. The stories were different, but the underlying theme was the same. Class, caste, religion and patriarchy all collude against women. We wanted to bring this issue into the open. We wanted people to discuss it. All the women who had died were between 18 and 24 years of age. They all either had small children or were pregnant. Even today men in these areas think they have absolute right over their wives. What they do with them is their private family matter. We wanted all the different views to emerge", says Madhavi Kukreja, the crusading founder of Vanangana.

The campaign started in the first week of January 1999. In each village, a play was first enacted to project the theme. The play was based on the true story of a girl from one of the villages. In the play, the girl is mercilessly beaten by her husband but gets no refuge even in her fathers home. When she eventually dies, there is much breast-beating. Her father threatens

to take the matter to the police, but instead of having his son-in-law arrested, the father, at the instance of the police strikes a deal with his son-in-law. He goes home richer, his conscience clear. After all his daughter cannot come back so what harm can some cash do? The police is happy it has done its job; it has resolved a case amicably (and, not to be mentioned, lucratively). The boy is also happy. He is free, free to marry again and bring in another dowry.

The play was followed by an open discussion in the villages. Since there had been recent incidents of violence in these villages, there was tension and some acrimony. However, Vanangana activists were able to contain this because the objective was to initiate a debate, create awareness and build up public opinion against it.

The incidents of domestic violence in these villages make gruesome stories. In Bhitakhera village, the body of Gita Devi had been found in the fields in July last year. She had been first hanged and then her body had been thrown out in the fields where it was discovered the next day covered by slush and rain. Her in-laws had fled. Her husband and in-laws were later arrested, only to be released on bail soon after. Gita Devi's death raised many issues that were discussed in the meeting after the play. Women said they felt helpless because they were not educated and there were few opportunities for employment. The legal system and the police were all insensitive to a woman's needs. The growing demands for dowry, they said, had made life insufferable for women.

When Neelam, a newly married girl died of burns in village Bachran, her father with the help of Vanangana activists lodged an FIR against the husband and got him arrested. However, six months on, the situation is completely different. The father struck a deal with his son-in-law. No one knows the details of the deal, but he is now getting his second daughter married to the same person.

About 400 people had assembled in Bachran village to watch the play. There was some tension because the theme of the play was so close to the sordid events of their own village. Many women wept and said the situation was the same everywhere but who was willing to listen to them?

One youth said that it was the greed for dowry that made life miserable for women. Another stated that the question was not one of dowry alone. It was one of mentality. Till such time as men consider women inferior and no better than slaves, the situation will not change. In-laws who murder their daughters-in-law and parents who compromise with their daughters' killers should be socially ostracised. Not everyone, however, was in favour of change. One old man said that when a girl gets educated she starts asking for her rights, and that is not acceptable to men, that is why there is conflict. Another criticised women's groups which talk of the rights of women and break up families.

One elderly villager said that Bachran village was considered the most ideal village in the district, but some four incidents of violence against women have spoilt the name of the village. In an intensely emotion charged ambience, one young man who beat his wife frequently took a pledge in front of all those assembled never to beat her again.

Ahrjiya, a harijan girl of village Bihara, consumed poison and died only three months after her marriage. Vanangana members tried to persuade her father to register the case. He would agree, and then back out. Finally, it was discovered that he had taken money to hush up the matter.

The complicity of the police at worst, or their apathy at best, was another reason why perpetrators of crimes against women got away. This was the view of women in a large meeting that was held in village Agarhunda. Kamlesh, a backward caste girl belonging to this village, had been married to a man from another village. She was frequently beaten by her in-laws. No one in the village would come to her rescue. She was not allowed to go to her father's home. Last June, she was found dead, crushed by a truck. Her in-laws said it was an accident. Her father and others, however, did not believe that. They suspected that she had first been killed and then thrown under a truck. Everyone in the neighbourhood knew she used to be beaten. In fact, all her neighbours testified that she had been badly beaten the day before she was found dead. However, no FIR was lodged because the police did not find any evidence of murder.

In the meeting in Agarhunda village, Kamlesh's mother crying profusely, declared "I have lost one daughter, but we will see that no else in this village loses another".

In village Chamrauha, Nirmala, an adivasi woman, was found dead hanging from a tree. She was several months pregnant. People said she was brutally beaten up by her husband, but the police did not register the case. Her father was very poor and belonged to a distant village. Pursuing the case would have meant frequent trips and expenses both in cash and in lost earnings. After Vanangana had staged the play in this village, Nirmala's case camp up for discussion. Some people said the police was responsible because they did not take these cases seriously, consequently culprits escaped and those who committed these crimes were not afraid. The role of society and its responsibility in the tragic loss of young lives also came up for discussion. Other questions generated heated exchanges too: "Does a man have a right to beat his wife if he wants to? Is it an internal family matter? Fights between father and son, or mother and son, or for that between two brothers are not considered exclusively an internal matter of the family. Why then, is only beating up of the wife an internal family matter?"

A young harijan girl, only 17 years old, died of burns in village Taraon. During the course of the discussion after the staging of the play, people said that even if a woman commits suicide, the family should be held responsible because their actions had driven her to the extreme step. How far where the girls parents responsible? In this case the girl did not want to come back to her husband's house, but her mother had forced her to come. To complicate matters, there were also rumours that the girl had illicit relations with her father. Many women, however said it was very easy to spoil a girl's reputation and then harass her.

Leelavati, the woman pradhan of the village took a vow along with other women that they would not be silent in such cases any more and work towards change.

One of the objectives of the campaign was also to sensitise the bureaucracy. After covering 30 villages, on the penultimate day, the play was staged in the premises of the district court in Karvi, Banda. Hundreds of people attended the meeting. The song 'Kya kassor keenha, kanha, jo diyo ye sajaye, babul bhaiya, maiya, sab bhaye paraye,' brought tears to the eyes of many of those present. The district magistrate and other officials participated for over two hours watching the play and taking part in the discussions.

"When we started the campaign we were unsure of what to expect. We just knew we had to take up the issue. Vanangana activists themselves have been victims of brutal violence. But they are lucky to have escaped. Others have not been so fortunate. We wanted to show that women's rights are human rights. The response in all the villages has been overwhelming and beyond our expectations. The campaign has generated a public debate and the bureaucracy and police will have to take notice", say the organisers.

'A public hearing on the issue is next on our agenda,' says Madhavi, 'the struggle will go on'.

Health in the Ninth Plan

K R Nayar

Given that there is enough evidence today to show that the long neglect of public health is dramatically changing the epidemiological profile, the Ninth Plan has paid little attention to improving these services.

THAT all plan perspectives begin with a sad story and end on a happy note make one wonder about the 'continuity' of different plans. The Ninth Plan perspective on health is no different. It starts on how our great traditions were lost by 'inappropriate use of science' and 'colonial pattern of industrialisation' and how these resulted in the impoverishment of masses. After the usual statement on history, the perspective starts on the gloomy side of Indian health service system by stating or rather admitting that the health system is functioning sub-optimally. The health service system is plagued by lack of essential infrastructure, suitable equipment and appropriate the humanpower especially in some critical positions, and poor referral services (source: nicnet).

The stated intentions of the perspective on health could be found in any number of such earlier government documents. They are:

(i) an absolute and total commitment to improve access to, and enhance the quality of, primary health care in urban and rural areas by providing an optimally functioning primary health care system as a part of the basic minimum services;

(ii) to improve the efficiency of existing health care infrastructure at primary, secondary and tertiary care settings through appropriate institutional strengthening, improvement of referral linkages and operationalisation of Health Management Information System (HMIS);

(iii) to promote the development of human resources for health, adequate in quantity and appropriate in quality so that access to essential health care services is available to all and there is improvement in the health status of the community; periodically organise programmes for continuing education in health sciences; update knowledge and upgrade skills of all workers and promote cohesive team work;

(iv) to improve the effectiveness of existing programmes for control of communicable diseases; to achieve horizontal integration of ongoing vertical programmes at the district and below district level; to strengthen the disease surveillance with focus on rapid recognition, reporting and response at district level; to promote production and distribution of appropriate vaccines of assured quality at affordable cost; to improve water quality and environmental sanitation; to improve hospital infection control and waste management;

(v) to develop and implement integrated non-communicable disease prevention and control programme within the existing health care infrastructure;

(vi) to undertake screening for common nutritional deficiencies especially in vulnerable groups and initiate appropriate remedial measures; to evolve and effectively implement programmes for improving nutritional status, including micronutrient status of the population;

(vii) to strengthen programmes for prevention, detection and management of health consequences of the continuing deterioration of the ecosystems; to improve linkage between data from ongoing environmental monitoring and that on health status of the population residing in the area;

(viii) to improve the safety of the work environment and worker's health in organised and unorganised industrial and agricultural sectors especially among vulnerable groups;

(ix) to develop capabilities at all levels for emergency and disaster prevention and management; to implement appropriate management systems for emergency, disaster, accident and trauma care at all levels of health care;

(x) to ensure effective implementation of the provisions for food and drug safety; to strengthen the food and drug administration both at the centre and in the states;

(xi) to increase the involvement of ISM and H practitioners in meeting the health care needs of the population;

(xii) to enhance research capability with a view to strengthening basic, clinical and health systems research aimed at improving the quality and outreach of services at various levels of health care;

(xiii) to increase the involvement of voluntary, private organisations and self-help groups in the provision of health care and ensure inter-sectoral co-ordination in implementation of health programmes and health-related activities; to enable the panchayati raj institutions (PRI) in planning to and monitoring of health programmes at the local level so that there is greater responsiveness to health needs of the people and greater accountability to promote inter-sectoral co-ordination and utilise local and community resources for health care.

Two important areas which need closer scrutiny in a perspective on health are its approach to primary health care and to disease control programmes.

The existing primary health care institutions, according to the document are functioning sub-optimally because of inappropriate location, poor access; lack of maintenance; lack of professional and para-professional staff at the critical posts; mismatch between the requirement and availability of health professionals especially physicians at PHC; lack of funds for essential drugs; lack of first referral units (FRUs) as linkage for referral services. On realising that the goal of 'Health for All (HFA) by 2000 AD' laid down in the National Health Policy (1983) was unlikely to be achieved within the time specified, the Eighth Plan restated the goal as 'Health for Underprivileged (HFU) by 2000'. It appears that even this nominal 'target' would not be achieved within the plan period.

The primary health care units have been in a shamble as revealed in the plan document. Even the referral units are not functioning effectively. The number of functioning CHCs which form the first referral unit (FRU) is far below the projected requirement. There are also marked disparities at the state and district level while the basic minimum services are not been given priority by some states. It is a matter of concern that many of the districts with poor health indices do not have adequate health infrastructure. Taking cognisance of the widening disparities among the states in the availability of basic minimum services (BMS), the conference of the chief ministers in July 1996, recommended that additional central assistance (ACA) may be provided to the states for correcting the existing gaps in the provision of seven basic minimum services (BMS). But it is doubtful whether the pattern of utilisation of such additional assistance could have led to any reduction in the disparities. This could be largely attributed to diversion of such funds by some 'critical' states. Construction of buildings rather improving the quality of services was given priority. Even the funds received from the department of family

welfare and the externally assisted projects were used for construction of buildings. Thus, the reasons for the 'sub-optimal' functioning of primary health care institutions identified in the plan perspective are only partially addressed. An initiative which could be vigorously pursued and probably more concretely stated than in two lines in the Ninth Plan is the role of people's planning under panchayati raj. This is of course easier said than done as a number of states even now have not initiated a revitalisation of panchayati raj institutions. It appears that P R is largely used to transfer responsibilities and impose programmes on the lower levels than evolving a democratic set-up for decision-making. Therefore, a clear statement on the policy of decentralisation in health and identification of problems in achieving this objective needs to be included in the document.

The secondary and tertiary care on the other hand are handled differently with a dose of World Bank medicine. The added thrust on privatisation is quite evident in the policy prescriptions regarding secondary and tertiary care. A whole lot of concessions such as land, water and electricity and exemption from import duty for diagnostic equipment for the private sector is suggested for setting up tertiary care/super speciality institutions.

Disease Control Programmes

One of the problems in the post-liberalisation period with regard to health care is the gradual neglect of an integrated health care delivery system including control of communicable diseases and the entry of vertical, technocentric and selective packages. These included tuberculosis, blindness control, reproductive health, AIDS, etc, largely because of the external assistance to these programmes. Some of the new initiatives in the Ninth Plan include horizontal integration of vertical programmes, hospital infection control and waste management, and disease surveillance and response. An integrated approach to disease control programmes have been tried earlier with the multipurpose workers. However, what we witnessed is further verticalisation and added thrust on specific diseases influenced by the external assistance. Unless the linkages between financing and programming are clearly understood, the alien ideas which accompany the packages would wreck the disease control programmes.

Among the communicable diseases, malaria and tuberculosis are certainly given importance. The National Malaria Eradication Programme intends to begin an intensive implementation of the modified plan of operation (MPO) in the malariogenic areas of the country in the Ninth Plan. The areas identified are the seven north-eastern states and 100 districts spread over the states of Andhra Pradesh, Bihar, Gujarat, Madhya Pradesh, Maharashtra, Orissa and Rajastan based on the criteria of (a) annual parasite index of more than two for the last three years; (b) deaths due to malaria; (c) P falciparum rate of more than 30 per cent; and (d) tribals constituting more than 25 per cent of the population. The main components to be strengthened in the Ninth Plan are (1) Early diagnosis and prompt treatment through active and passive surveillance and laboratory diagnosis; (2) Selective vector control by integrating various vector control approaches and promotion of personal protection methods; (3) Prediction, early detection and effective response to malaria outbreaks; and (4) Intensified information, education and communication campaigns. The programme still strongly depends on clinical and technical solutions than on addressing epidemiological, ecological and social dimensions of the disease. The methods which are being advocated such as personal protection through impregnated bed nets show that the social dimension of the disease have not been well conceptualised. It appears that the planners have not learnt from the past mistakes of the programme. What is needed for the intensive phase is a better managerial approach with emphasis on ecological and social dimensions.

The National Tuberculosis Control Programme (NTCP) also receives considerable attention in the perspective. The revised programme for tuberculosis (RNTCP) would be implemented in 103 districts apart from strengthening 203 short course chemotherapy (SCC) districts. This extension is based on the experience of pilot studies in 17 project sites in which it is claimed that 60 to 80 per cent cure rate was achieved. It is not known how this can be replicated given the intensive efforts done during the pilot phase and the fact that most of these were carried out by agencies in the private/NGO sector in urban areas. Nevertheless, efforts should be made to reveal and address the problems identified during the pilot phase instead of blindly carrying the programme forward just because assistance is available from the World Bank.

The AIDS control programme is the classic example of the external control over India's communicable disease control programmes. While diseases of the poor such as cholera and diarrhoeal diseases do not find a place in the perspective, AIDS occupies a central place as a cent per cent

centrally aided programme through external assistance. Similarly, non-communicable diseases also receive considerable attention. These include cancer control, micro-nutrient malnutrition, diabetes, cardio-vascular diseases, mental health, etc. Some states had also initiated pilot schemes in the Eighth Plan for integrated non-communicable disease control with diabetes as a model in some districts. In the Ninth Plan as well these will be continued with added emphasis on diagnosis and management through the primary and secondary care level assuming that diseases like diabetes, cardio- and cerebro-vascular diseases and malignancies are going to comprise the major disease burden in the rural areas. In reality, this apart from adding to the programme burden of the PHCs and CHCs would also serve as a conduit for private diagnostic institutions sprouting up in the rural areas.

The perspective on environment and health starts with a broader approach with focus on detection, prevention and management of existing deficiencies or excesses of certain elements in the natural environment, macro-environmental contamination of air, land, water and food, natural disasters, etc However, communicable diseases due to environmental conditions in the urban and rural areas need to be clearly spelt out in terms of specific programmes and strategies rather than a 'garbage clearing' approach which mainly evolved in the post-plague period. One of the positive features of the perspective is the stated intention to evolve programmes for the agricultural and unorganised sectors. Any structured health programmes evolved for these sections including vulnerable groups such as women and children, however needs to be carefully conceptualised in the perspective so that it may not result in yet another vertical programme.

That external assistance has considerably influenced the outlook of the Ninth Plan perspective on health is quite evident. The strength of India's health care system is its elaborate network of health care infrastructure which is being systematically undone in recent years despite the claim that external assistance has been used to improve primary health care infrastructure. However, apart from buildings there have been no improvements in the quality of services. In fact, the focus during the Eighth Plan was on strengthening health care infrastructure aimed at improving the quality and outreach of services. However, health care infrastructure was largely visualised as construction of buildings. Along with this, the clear policy shift towards privatisation during this period has resulted in the utter neglect of public health services. The outlay for health sector has also steadily declined from 3.3 per cent of the total plan outlay in the First Plan to around 1.7 per cent in the Eighth Plan. More than one-third of this investment is by external assistance linked to specific diseases such as AIDS, blindness control, etc. On the other hand, investment for family planning has been growing over the years. The annual report of the ministry of health states that the public expenditure in the health sector has been a little over 1.5 per cent of the GDP while WHO recommends that it should be at least 5 per cent of the GDP. The collapse of the public health system in the country and the loss of faith of the people in government health services could be largely attributed to the declining investments especially after the structural adjustment programmes. At the same time, these trends are also used as a rationale for ushering in privatisation in the health sector. The collapse of the public health system has also influenced the epidemiological profile of the country. Acute respiratory infections and malaria are showing a rising trend from 1988 onwards. As are pneumonia, tuberculosis, viral hepatitis, cholera, and enteric fever in recent years. The dramatic decline in the infant mortality rate, a sensitive indicator of health status, occurred only during the pre-reform period. The rates have been rising, stagnating or the decline has slowed down in most of the vulnerable states of India. Even in Kerala the IMR has been showing a rising trend. In Karnataka, the rate has not declined much over the last 10 years. The situation warrants effective intervention. As a beginning, the comprehensive review of public health system in the country undertaken by the Planning Commission should now be discussed in an open forum to enlist the views of public health scholars from different parts of the country before any major reformulation in the national policy and revision in the public health strategies as proposed in the perspective are initiated.

PAKISTAN

IMF Package: Nothing to Celebrate

S Akbar Zaidi

The expectation that the resumption of IMF loan will rescue Pakistan's economy is based on fiction, not fact. It will at best provide some breathing space, nothing more.

ALTHOUGH celebrations have already started in Islamabad over the resumption of the IMF $1.6 billion ESAF, this is probably the best time to take stock of Pakistan's economy which has struggled to cope with events that arose as a consequence of Pakistan's nuclear tests. While there is little doubt that the resumption of this loan, incorrectly called aid, will have an immediate positive impact on Pakistan's economy, both in terms of the government and also the private sector, this euphoria is likely to be short-lived.

The immediate availability of foreign exchange will ease some pressure on the government's reserves, and will help in some debt repayment over the next few weeks. The government will welcome this even if the London and Paris clubs agree to concessions in response to Pakistan's request for debt rescheduling. The private sector should also respond favourably as a commitment from the IMF is usually seen as a positive signal signifying that the rot has been stemmed. Specifically, an easing of the pressure on the exchange rate and a restoration of confidence on the part of the international financial institutions in the economy will give an impetus to business confidence in Pakistan. A likely upgrade in credit rating should also follow.

However, this is as far as it goes. All that the IMF loan does is that it allows Pakistan some breathing space over the next few weeks in terms of its balance of payments, and nothing more. The expectations that this package will 'rescue' Pakistan's economy are based more on fiction than on facts. The recent experience of Russia and now Brazil confirms that outside credit is insufficient to shore up investor confidence beyond the very short term and that it will be unable to override key internal structural problems. Nor is this all. In the case of Pakistan, as in the case of a very large number of countries which have taken loans from the IMF, the evidence suggests that things get worse.

rather than better, as one would expect. This is the greatest fear arising from adherence to the IMF's structural adjustment programme.

The main component of the new IMF deal, as it has been in the past, is the target for Pakistan's budget deficit. Currently around 5.5 per cent of GDP, the budget deficit is expected to decline to 3.3 per cent by June 2000, a fall of more than 2 percentage points in 18 months. The lowering of this key statistic will be based upon a host of fiscal measures, which include a rise in the GST, a reduction in non-development unproductive expenditure, restructuring of key public utilities of which WAPDA and KESC head the list, privatisation of financial institutions and a reduction in the federal subsidy for wheat. In addition, the programme envisages a decline in tariff rates, further trade liberalistion, enforcement of a market-based foreign exchange regime and broadening and restructuring of the tax system.

Through these measures it is expected that Pakistan's economy will once again achieve GDP growth close to its historical level of 6 per cent; inflation is also expected to fall to a mere 6 per cent by 2002, and the current account deficit currently in excess of 3 per cent of GDP is expected to fall to less than 1.5 per cent over the same period. It is unlikely that many analysts would disagree with the need for far-reaching structural changes to revamp Pakistan's economy. With domestic and foreign debt collectively equivalent to around 90 per cent of Pakistan's GDP, and with interest payments consuming more than half of the country's annual budget, it is not surprising that the budget deficit continues to be the main focus of the latest IMF package. Also, few would disagree with the need for a better tax system, better public services and better governance, all concerns which form part of the new agreement with the IMF. However, since this is the fourth major agreement with the IMF in a decade, a look at the past would perhaps inform our judgment far better.

Since December 1988, when Pakistan entered its first major agreement with the IMF, all governments have been following the broad guidelines of a structural adjustment programme. While the emphasis has shifted now and then, for the most part the basic ingredients continue to be the same. The fiscal deficit has remained the key plank of these agreements, and tariff rates have shown a marked fall from a maximum rate of 225 per cent in 1992 to around 35 per cent today. Privatisation has been actively pursued, with over 70 firms and industries already privatised; two of the five nationalised commercial banks have also been handed over to the private sector. Pakistan's rupee has continued to be devalued from Rs 18 to one US dollar in 1988 to nearly Rs 50 today. Subsidies have been cut, and administered prices in the utilities sector continuously raised over the last 10 years. Government expenditure has been cut as a consequence of the structural adjustment programmes and the fiscal deficit has been drastically reduced from a high of 8.7 per cent in the first Nawaz Sharif regime in 1990-91 to its low current level of around 5.5 per cent. Hence, quite clearly, over the last 10 years, governments of Pakistan have adhered to the IMF's structural adjustment packages and the current agreement needs to be seen as a continuation of those agreements. The critical question to ask then is: What has been the outcome of these policies followed on the recommendations of the IMF?

Although it is difficult to prove causality, some interesting observations on the economy after 1988 help show how the economy has performed after the initiation of the structural adjustment programme. Firstly, the overall growth rate of GDP has fallen well below trend levels, and appreciably below the average of the 1980s. In the 10 years since the implementation of the programme, in only one year was growth of GDP more than the average of 6 per cent observed since 1977; in two of those 10 years, in 1992-93 and in 1996-97, the growth of GDP was 2.3 per cent and 3.1 per cent, respectively, the lowest in more than three decades. In the 10 years since 1988, inflation was in double digits in eight years, while previously in the 40 years during 1947-87, inflation was in double digits on only seven occasions.

The current account deficit, reduction of which is one of the goals of the structural adjustment programme, was more than 4 per cent of GDP in seven of the 10 years; in the period prior to the enforcement of the programme for the eight years, 1980-88, the current account deficit was 3.6 per cent, rising thereafter due to the trade liberalisation reforms. Manufacturing growth rates, which averaged 9.1 per cent during 1980-88 fell to 4.9 per cent during 1988-97, falling to a mere 1.78 per cent in 1996-97, the lowest in the last 30 years. Because of the obsession with the fiscal deficit, public expenditure has been cut, and development expenditure in particular has borne the brunt. From a high of 9.3 per cent of GDP in 1980-81, development expenditure has been falling since and in 1997-98 was only a little over 3 per cent of GDP.

Research has shown that after 1988 poverty has returned to Pakistan in a big way, with the number and percentage below the poverty line increasing. Public sector employment, historically an important anti-poverty measure, has fallen, while wages have decreased in real terms: real wages, which increased by 0.7 per cent during 1980-91, fell by 2 per cent during 1991-95; public sector employment is estimated to have fallen by 10 per cent during 1990-93 and 43.2 per cent of workers previously employed in public enterprises were laid off by their new employees. Overall unemployment in occupations with a high incidence of the poor has dramatically increased and real wages of skilled and unskilled labour have sharply declined. In addition, subsidies that were critical to the consumption pattern of the poor have been cut while the burden of indirect taxes on the poorest income group has increased. Not surprisingly, there has been an increase in poverty and inequality, particularly in the rural areas.

It is important to emphasise that while these numbers show a very obvious downward trend since 1988 when the structural adjustment programme was introduced, we cannot prove that this is on account of the programme since there are numerous other factors which have also affected the economy – frequent changes in government, a fall in remittances, deteriorating law and order, for example. Nevertheless, given the dramatic changes that have taken place in the economy as a consequence of the programme, common sense suggests that it is more than likely that the adjustment programme had a large contribution to make to this downturn.

Little has changed with this new (or restarted) ESAF programme. The conditions attached to the loan are similar to those in the past, as are the main targets and goals. It is unlikely that, as commonly believed, this loan from the IMF will be a panacea for the numerous ills that afflict our economy and society. While restructuring is urgently required, it will need to incorporate far more fundamental changes than those that form the fine tuning of the IMF packages. Numerous writers have argued the need for institutional reform, provincial and local level democracy and autonomy, and a drastic restructuring of the nature of Pakistan's antiquated state structure. The policies of the World Bank and of the IMF have failed time and time again. Perhaps it is time now to try restructuring and adjustment of a very different nature.

Globalisation: A Socialist Perspective

James Petras

By understanding the historical and structural limits of 'globalist ideology' we can escape the tyranny of globalism. The alternatives grow out of the experiences emerging from the failures of the 'export strategies'. By focusing on social relations and the states as the building blocks of global empires we can escape the prison of globalist thinking and enter the realm of political and social action.

GLOBALISATION at a minimum involves the creation of a world economy which is not merely the sum of its national economies, but rather a powerful independent reality, created by the international division of labour and the world market which in the present epoch predominates over national markets. Large-scale, long-term flows of capital, commodities, technology and labour across national boundaries define the process of globalisation.

Contemporary globalisation is similar and different from earlier phases of the process. As in the past, the major forces organising the movements of capital and commodities are the imperialist countries and the dominant classes within those states. Globalisation involves 'globalising' nations and classes and the 'globalised'. Thus the process is embedded in a hierarchical system of power, exchanges and benefits. The formation of a world market and an international division of labour involved(s) three types of relations: (1) Imperialist directed exchanges with colonised and/or dependent nations. (2) Inter-imperialist exchanges between the dominant powers. (3) Inter-dependent exchanges between non-imperialist nations and classes.

The imperialist classes compete and collaborate over markets and capital outlets: the consequences of exchanges are more or less beneficial to both parties. The imperialist-colonial/dependent exchanges and capital flows are asymmetrical and highly skewed to favour the imperial countries.

In summary, globalisation is a highly differentiated phenomena that has historically been linked to the concentration and centralisation of capital, wealth and power. The driving force has been the co-operation and competition of the imperialist powers.

In Historical Perspective

Contemporary globalisation retains many of the key features of the earlier phases of the process: the driving forces are centred in the imperial state and the multinational corporation and banks, backed by the international financial institutions. What is significantly different is the scale, scope and speed of the circulation of capital and commodities, particularly financial flows between de-regulated economies. Technological changes especially in communications (computers, fax, etc) have been a prime factor in shaping the high velocity of movements of capital.

The scope and scale of movement of capital and commodities, however, is less due to technological than to political changes. The demise of socialism in the former Communist countries of Europe and Asia, the conversion of nationalist-populist third world regimes to unregulated capital and the demise of the welfare state in the west have opened vast areas for accumulation of profits (and surplus capital) and new markets for sales and investment. The political victories of imperialism are thus central to the advance of the contemporary process of globalisation in relation to the historical period immediately following the second world war and certainly in relation to the inter-war period.

The conflict between globalising imperialist forces and the third world – what was erroneously referred to as the cold war – was evident in the 23 million people who died in 143 wars, overwhelming in the third world, between 1945-1992. The contemporary phase of globalisation was a consequence of what sub-commander Marcos refers to as the third world war which continues to this day.

The identification of the social, political and economic agents of globalisation is important in understanding the unequal impact of globalisation. Likewise a historical analysis of the phases of globalisation allows one to refute some of the ideological claims of its proponents. A retrospective analysis reveals that 'globalisation' has been cyclical in world historical development. There were periods of 'high' globalisation, moments of crises, and periods in which economic flows turned inward. There is no universal inevitable tendency toward 'globalisation'. Inter-imperial wars resulting from global competition, internal crises of over-production, and more important social and political revolutions have all affected the trajectory of globalist nations and classes. The cyclical nature of globalisation allows analysts to identify the internal/external weaknesses of the globalist-imperialist project and to identify the alternative strategies that emerged from the crises of global projects in earlier times.

The very idea of 'globalisation' as a historical necessity thus is questioned by its cyclical history. The notion that we enter a new period is also dubious: foreign trade and overseas income was a greater percentage of GNP in Europe during the late 19th century than at the end of the 20th century. The idea that technology drives globalisation, omits the point that most of the new technologies emerged prior to the current globalist phase and are compatible with expanding domestic production and popular consumption.

The globalisation idea is itself suspect. In its most widely expressed usage it argues for a universal incorporation to the world marketplace and the spread of benefits throughout the world. The empirical reality is neither universal incorporation nor the spread of benefits: there are wealthy creditors and bankrupt debtors; super-rich speculators and impoverished unemployed workers; imperial states that direct international financial institutions and subordinate states that submit to their dictates. A rigorous comparative analysis of contemporary world social-economic realities would suggest that the 'globalist' concept of 'interdependence' is far less useful in understanding the world than the Marxist concept of imperialism.

Rise of Globalist Ideology

The rise of globalist ideology is found originally in the business journals of the late 1960s and early 1970s. The major expansion and conquest of markets by the multinationals was described as globalisation by business journalists searching for an alternative to the existing Marxist vocabulary, since they sought to present the process in a favourable light. Gradually the term was taken over by the mainstream academic world and became the acceptable framework for talking about international

capitalist expansion without having to deal with its origins, power relations and exploitative outcomes. What emerged from the academic recycling of the concept was 'globaloney' – the embellishment of the concept by linking it to what was called the third technological revolution and imputing to it a historical inevitability and degree of interdependence that was remote from reality. From the business, journalistic and bourgeois academic world, the term was incorporated into the vocabulary of the Left intelligentsia. They too began to parrot the same properties and arguments in the context of a mindless flight from critical socialist paradigms. Thus 'globalisation' seems to have become a universal category of analysis through which the imperial ruling classes exercise power and paralyse mass popular opposition.

The retreat of the Left intellectuals from the imperialist theoretical approach toward globalisation is intimately related to the defeat and decline of revolutionary socio-political movements and the ascendancy of the financial and export elites. There is a dialectical inter-play between imperialist power, globalist ideology and revolutionary socialist politics: the ascendancy of imperialism is directly related to the circulation of the globaloney discourse and the eclipse of the revolutionary paradigm.

The retreat of the Left intellectuals and the subsequent theoretical disarray of the popular movement contributed to the further strengthening of the imperial ruling classes: objective shifts in power resulting from political and economic successes were amplified by the ideological capitulation of the ex-Leftist intellectuals and the confusion sown in the popular movement. The tyranny of globalism was responsible for the subjective weakness of the popular classes that reinforced the objective power of imperial capital. The Left intellectuals and influential political leaders having lost their conceptual anchorage drifted from an imperialist conceptual framework to a technological determinism that undercut any notion of systemic transformative politics. The underlying political bases for the ascendancy of 'neo-liberalism' (the ideological derivative of the globalisation hypothesis), the political and military defeats of the left were slighted in favour of pseudo-explanations that pointed to historical economic imperatives.

The political and ideological hegemony of the globalist-neo-liberal project was further enhanced by the combined 'rigidity' and flexibility of the neo-liberal state: opportunities for upward mobility for private sector professionals and ex-Leftist intellectuals ensconced in well-heeled NGOs and downward mobility for the mass of peasants, wage and salaried workers, particulary in the public social services. The project provided massive flows of capital, cheap mass consumer imports in the expansive phase and crises, collapse and unprecedented rates of bankruptcy and unemployment in the deflationary phase.

The Asian experience is a prototype of this process: political economic victories for imperialism, the ascendancy of 'globalist'-neo-liberal political economic power, capitulation and integration of the ex-Left, followed by crisis, collapse and mass immiseration. The fundamental question for us today is: after the crisis, is a revival of revolutionary socialist politics possible? A precondition for any revival is a recovery of the Marxist-imperialist theoretical framework.

Socialist Perspective

Faced with the demise of the globalist project, with the foreign investors picking the bones of the moribund carcass – namely, the lucrative enterprises – how do we reconstruct a socialist alternative?

In the first instance, by recovering and reconstructing our theoretical tools. Secondly, by learning from and inverting the lessons from the Right on how to engineer a radical political-economic transition, a transition that combines social justice, democracy and efficiency in the organisation of a new socialist economy. To move from a critique of globalist-neo-liberal configuration to a socialist alternative we need to adopt the method of historical materialism and ask ourselves: what do we learn from previous experiences of globalisation via imperialism?

All the imperial powers throughout history were never 'globalised', they became gloablisers (imperialists) precisely through the development of the home market. Globalisation was an instrument to expand and deepen the home market and develop the forces of production. Globalisation was given a universal virtuous character in each epoch of outward expansion either in terms of moral values (extending western civilisation) or as an opportunity (to become modern). To the degree that contemporary globalisation leads to the internal exploitation of labour and state resources within the imperial centres, it has awakened a labour opposition that creates a objective and subjective basis for internationalist working class action.

The history of globalisation is fraught with inter-imperial rivalries which struggle to displace competitors and impose the rule of particular 'national' multinationals and state rule. The selective anti-imperialism of local clients facilitates the entry of imperial late-comers. The reconstruction of the Left cannot be rooted in becoming the plaything of rivalries between ascending and declining imperial powers. In the present context, there are several issues: the US exploitation of the Asian crisis to enhance its position relative to Japan, South Korea, etc. The temptation among some Leftists is to defend 'state centred' capitalism against 'neo-liberalism'; for others, the alternative is to accept the harsh prescriptions of adjustment from the IMF in exchange for employment, etc.

The basic facts are that capitalism cannot sustain growth and rising income levels: that welfare and capitalism are a product of a special balance of class forces that no longer exists. The existence of a revolutionary socialist alternative was the basic reason forcing capital to make reformist concessions in Europe and Asia. It was the existence of revolutionary socialist regimes that forced the imperialist countries to tolerate 'state directed growth' in Asia and to 'showcase' their performance. The Asian tigers were by-products of a historical conjuncture, a particular confrontation of social systems. Only the re-emergence of credible revolutionary alternatives might allow reformist and state-centred technocrats to negotiate concessions. As matters stand today, the real choices are between a capitalism that strips labour of all its social attributes, that monopolises public revenues and appropriates public enterprises and minerals and the socialist alternative - that needs to be reconstructed.

The Globalisation Parabola

Crucial to the task of constructing the socialist alternative is to recognise the globalisation parabola in the current period: the ascendancy in the 1970s, its consolidation in the 1980s and early 1990s and its decline over the last several years, beginning in Asia, Latin America and spreading to North America and to western Europe. The second biggest capitalist economy, Japan, is in a terminal tailspin, accompanied by its Asian clients. In China, stagnation and mass unemployment has set it. The Russian economy has collapsed. The US and European economies will soon feel the reverberations as corporate earning declines, and exports collapse and speculative capital cannot find new lucrative outlets.

Globalisation works in reverse. The extraordinary profits based on imperial appropriation of speculative returns no longer fuel the American and European stock market and giant financial monopolies. The worldwide bankruptcy of capitalism – its inability to reproduce itself – poses a major opportunity to argue for a socialist transformation and against strategies focused on adaptation and merely defensive struggles. Adaptation to austerity leads to new regressive policies. The argument for 'one more adjustment' is an unending melody. There is only more pain, not prosperity, in the never-ending tunnel. The link between the excess circulating capital, the declining earnings of corporations and the shrinking effective demand means infinite regression (at least for the foreseeable future). Defensive struggles, while necessary in sustaining elementary living conditions in the face of the economic collapse, provide short-term victories yet prepare strategic defeats, given the non-viability of the historic capital-labour partnership under present circumstances.

That leaves us with the concept of a socialist transformation – transformation of what? toward what?

There are two basic fallacies regarding socialist transformations. One is the notion of 'de-linking' linked to the ideas of 'self-reliance' and 'building socialism in one country'. The other is the more recent idea of 'market socialism', the notion that market-driven forces can create the material basis for socialism. Both conceptions contain grains of truth, but in their underlying logic are very harmful to the construction of socialism.

First, the possibility of development of socialist productive forces de-linked from world production leads to costly, inefficient and ultimately prolonged periods of harsh 'accumulation'. In most cases, de-linking is just not feasible without giving up essential products necessary for consumption and production. Only under harsh war time conditions or in periods of boycotts and state of siege does it make sense to try to make a virtue of necessity by appealing for 'self-reliance', urging the people to sacrifice and encouraging the idea that despite a harsh external setting that a revolutionary population can produce and survive. Such was the case when the US and the ex-USSR encircled Mao's China and restricted its external trade relations. But it would be an egregious error to convert special circumstances into a 'model' of development.

The second erroneous approach is the Dengist idea that market forces, private ownership, free trade and foreign investment directed by the Communist Party can become the driving forces toward the construction of socialism. The ascendancy of market forces has transformed the Chinese labour force in a global reserve army of cheap labour; it has converted the cadres and leaders of the party into business people who plunder the state for private gain, destroy the environment and produce ecological disasters. In a word, it is the market that directs the party and its leaders and not vice versa. The result is the worst case scenario where the authoritarian political structures of communism are combined with the brutal socio-economic injustices of capitalism and the catastrophic degradation of the environment. That is the operative meaning of 'market socialism'.

We should approach the construction of socialism in a different manner. First of all, the working class has created a vast body of knowledge over time that is 'world knowledge'. The revolutionary regime must link up with this world knowledge in order to avoid the cruel and costly earlier stages of development in which this knowledge was created. In a word, the revolution must link up with world centres of know-how as a necessary step to increase the local capacity to advance the forces of production and democratise the relations of production. But the external linkage must take place under conditions that increase the internal capacity to deepen the home market and serve popular needs.

Secondly, the economic exchanges, 'market relations', both external and internal can only have a progressive function if they are subordinated to a democratic regime based on direct popular representation in territorial and in productive units. Assembly style democracy is not only a strong deterrent of bureaucratic distortions, but also serves as an essential control mechanism over the content and direction of market exchanges.

The current fragmentation and dissolution of production is a result of the 'enclave nature' of the export strategy, where key production units specialised in specific commodities serve the international strategies of overseas and domestic investor elites. The socialist strategy focuses on the creation or reconstruction of essential links between domestic economic sectors. The socialist economy resembles a grid rather than the spoke of a wheel that is characteristic of imperial dominated export economies.

The current overseas economic packet that combines foreign investment, control and management decision-making with technology transfers (when they occur) must be disaggregated under socialism. The capturing of technology without the inconvenient encumbrances of foreign dictates and outrageous CEO salaries and foreign ownership is possible because of the plethora of technologically knowledgeable individuals, and enterprises who can be contracted and paid to transfer know-how. This form of 'dependence' is temporary and has less possibility of perpetuating itself: learning from borrowing becomes the basis for adaptation to local needs and the development of autonomous innovative capacities. The breaking of the tyranny of globalisation requires the rejection of ownership and control and the selective acquisition of the accumulation of knowledge and products that produce dynamic growth. Thus the parasitical and exploitative structures of globalisation (imperialism) need to be differentiated from the creative and productive components.

These processes of rejection and acquisition pose one of the most important challenges to any transition from neo-liberal globalisation to socialism. Namely, managing the inherent contradiction between internal socialist relations and external participation in the capitalist marketplace. This requires not only democratic control over the economic processes but more fundamentally the ideological and cultural education of working people in values of solidarity, co-operation and equalitarianism. This educational and cultural process can only have credibility if the values articulated reflect the behaviour and practices of the leadership and cadres. The great feature of socialism in the ex-USSR was the dissociation of the ideas expressed by the leaders and their practices – which led to disillusion, cynicism, distrust and worse a fatal attraction for globalist propaganda.

A fundamental appeal in constructing the socialist power bloc to transform the society and a primary task on assuming power is the creation of socio-economic linkages between domestic needs (and 'latent demands') and the reorganisation of the productive system. The existing export strategy is the product of inequalities: the labour force is seen as a cost not as consumers (demand). Hunger salaries and labour impoverishment fuels high profits for production for overseas markets. The socialist transformation recognises the enormous potentialities of the domestic market based on equalised property, income and education and health. It recognises the tremendous potential in

the utilisation of unused or underused labour among the employed.

The turn inward is essential but the external linkages to overseas markets and knowledge remains a key factor to provide earnings and technique to compliment the domestic revitalisation of the economy. What is crucial however, is that external exchanges not substitute for local production and the creation of local centres of technical knowledge creation.

Essential to any socialist undertaking is a profound agrarian reform that includes redistribution of land and transfer of property ownership along with the reorientation of credits, technical assistance, marketing and transport to facilitate food production for mass consumption at affordable prices while providing livable income for rural producers. Whatever the particular ownership patterns – and there are too many variables to provide general blueprints – the agrarian reform should encompass agro-industrial complexes and related job-generating employment. Thus the production of 'inputs' and industrial 'processing' become part of the agrarian transformation. Practical experience plus the negative lessons of the ex-USSR teach us that the structure of agriculture requires a decentralised organisation in which direct producers make basic decisions in consultation with technical advisors in the context of integrating exchanges between regions, sectors and classes.

The transition from a globalised imperial export strategy toward an integrated domestic economy depends on integrating regions and production/consumption into a unified whole: of recreating the nation in a substantive way and reorienting the state away from serving the imperial or globalist aspirations of export and financial elites.

Strategy of Transition

A necessary pre-condition of a socialist transformation is a fundamental political change in the structure of the state. Contrary to the unreflective musings of globalist theorists in both their rightist and leftist versions, the state has played a powerful role in formulating the strategies of globalisation, allocating economic resources to 'global actors', bailing out elite losers and reinforcing the policing of globalist victims and opponents. To argue that the state has been weakened is to mistakenly identify the state with the welfare state; it is to confuse the apologetic pronouncements of the ideologues of the globalists who lament their impotence faced with 'globalist pressures' with the reality of their active collaboration via state institutions.

The state and nation become the central units for reconstructing a new internationalist socialist order. The popular movements in civil society are in basic conflict with the ruling classes of civil society over who controls the state and the nature of the socio-economic project. Once again ex-leftist ideologues disorient the popular movement by pointing to conflicts between 'the state' and 'civil society' – rather than examining how the most wilful and cruel exploitation occurs within civil society between landowners, bankers and financiers on the one hand and landless peasants, indebted small producers and unemployed workers on the other. So let us move on beyond the intellectual posturing of repentant ex-leftists seeking merit-points from their new paymasters to the practical measures that move the popular movement from political power to a socialist transformation.

In this regard we can learn a great deal from the transition strategies engineered earlier by the neo-liberal globalists. Key to the implantation of the new socialist economy is the immediate implementation of shock therapy for the ruling class: profits should be drastically reduced; bank accounts and financial holdings intervened and frozen; overseas payments suspended and a moratorium on debt repayments implemented. The shock therapy has political and economic value: politically it disorganises and disorients the ruling class; economically it prevents hoarding, capital flight and the provocation of hyperinflation. More important it involves strong state intervention to restructure the economy and reconfigure state budgets and institutions. The purpose is to open the economy for domestic production, to liberate credit and investment for expanding production and exchanges at the national, regional and local levels. Shock therapy predictably will evoke protests and dire cries of injustice and arbitrariness. But quick and resolute action in following up the shock therapy with substantive new investments and credits toward the domestic market can generate more than sufficient support for sustaining the regime.

Shock therapy, rationally applied, means renegotiation with former globalist patrons and partners, not repudiation. It does not spell rupture but a reordering of priorities and relations to favour the new forces of the domestic market.

The second phase in the transition involves economic reconversion: the shift from hyperspecialisation in single commodities and limited activity in the industrial production cycle (assembly plants) to diversified production, a better balance between local consumption and export production, and greater investment in education, research, health and productivity.

To realise economic reconversion requires a shift in investments, employment and income policy. This means the implementation of a structural adjustment programme from below. Essentially this means the redistribution of land, income and credits. The breakup of private monopolies and the reform of the tax system: realistic assessments based on market values of property, rigorous enforcement of tax collection (with severe sanctions for chronic evasion) the protection of emerging industries and the opening of trade for commodities that do not compete with local producers. Financial controls will eliminate speculative activity and state planning can redirect investments to human capital formation, employment generating public works and inter-regional production.

To avoid inflation and to stabilise the economy, a tight monetary policy will need to be put in place. Monetarism from below means the elimination of state bail-outs of billion dollar debts due to mismanagement, swindles or speculation by the private sector; the elimination of low interest (subsidised) loans and cheap credits to exporters; elimination of tax abatements for multinational corporations in so-called free trade zones. The gains in state revenues and savings can fund alternative socio-economic activity without resorting to the printing of money.

There are significant differences between a socialist and a neo-liberal structural adjustment programme. Socialisation will replace privatisation as a key to increase efficiencies, competitiveness and productivity. Socialisation will include extending transport and communication networks to further inter-regional ex-

changes, thus revitalising provincial enterprises, markets and producers. This means that 'cost-benefit' analysis will be based on regional or national measures rather than the narrow balance sheets of the particular enterprise.

For example, train service to rural areas may result in 'losses' to the railroad but increase production and consumption in the regional economy. The net outcome calculated on the basis of larger units over time provides a clear idea and more accurate (socialist) criteria for measuring cost effectiveness. Likewise, public investments employing the unemployed and increase output from zero upward is another measure of efficient utilisation of human capital. In terms of competitiveness it is clear that what is determinant is the recognition that economies are about nurturing people – an elementary and basic point. Socialised enterprises that produce staple food items are far more competitive in meeting basic needs than their counterparts in the export model who ignore them. In the context of meeting basic food needs, socialised production is more responsive to popular demands and more able and willing to meet this 'market demand'.

Socialisation of economic enterprises is necessary but not sufficient to create a viable socialist economy. What is required is a plan of industrial reconversion that allows popular demand not impersonal corporate bureaucrats to decide on 'winners and losers'. This means closing or reconverting luxury producing and importing enterprises and substituting enterprises that produce quality goods for mass local consumption. This requires that working people as consumers play a vital role in the decision-making process to avoid the shabby quantitative output of the ex-communist states.

Industrial reconversion requires, however, a balance between domestic and overseas production: export earnings will continue to be important to finance vital inputs to the dynamic domestic growth model. What is crucial in this relation is the reinvestment of surplus export earnings in the development of the internal market, not their transfer overseas or to speculative activity as is the case today.

Crucial to the structural adjustment model from below is the modernisation of the state. The state in the export model is largely made up of regulators who formulate rules and allocate resources to satisfy overseas investors and traders, drawing on domestic resources and providing little information to local producers about the decision-making process. This elite process is fraught with corruption as is evident in the bail-outs and privatisation scandals.

In rejecting the neo-liberal export model there is no going back toward the centralised bureaucratic state that stifled popular democracy, blocked innovative initiatives and produced gross inefficiencies. The modernisation of the state means the decentralisation of administration of state allocations to local recipients in civil society who vote on their priorities. It means the redeployment of political appointees from useless bureaucratic functions to productive work. State reform means the relocation of health workers to the neighbourhoods, agronomists to the countryside and teachers to the overcrowded popular urban schools.

Socialism means balancing consumption with production: workers' rights with obligations for raising productivity and observing workplace discipline; it means consumers, women and ethnic minorities are included in the production and consumption decisions. Consumers and citizens have to play a key role in directing the state and economic institutions to avoid having another 'dictatorship over the proletariat' or an abundance of cheap consumer goods that nobody is interested in purchasing because of quality, style, or attractiveness.

Probably the most basic and novel feature of the new socialism is the key role that workers, consumers and ecologists will play in the review, evaluation, hiring and firing of managers. The avoidance of a privileged bureaucracy in the public economic enterprises rests with an active role of the direct producers and consumers in fundamental decision-making. Thus, under the new socialism, self-management at the state, regional and local level is the alternative to the private export elite of the globalised economy and the state bureaucrats of the past.

The key role of direct producers also involves responsibilities – a recognition that in the transition some workers may still retain 'habits and practices' of work harmful to production and creation of quality goods. Guaranteed lifetime employment is not viable: periodical peer evaluations of performance of quality and quantity of services should be the norm. Chronic offenders should be fired. Abusive bureaucrats called to account. Public utilities workers made accountable for unacceptable delays. Local, decentralised organisation allows friends, neighbours and citizens to take decisions into their own hands to provide electricity, repair, telephone lines, etc. Absentee teachers should receive 'absentee salaries' and should be answerable to parents, students and others. Professors that recycle outdated lectures on yellowing note cards should be evaluated and advised to upgrade their courses or face dismissal

New socialism means the end of the double discourse. It means that personal lifestyle should be in accord with public discourse. Intellectuals cannot critique neo-liberalism and then engage in frenzied consumption of imported consumer items. One cannot preach equality up to the doorstep of the household and then practise the authoritarian (patriarchal) politics in the family. The new socialism recognises the complexity of the contradictions in the transition; foremost, the need to democratise gender, ethnic and race relations – to engage those struggles as important in themselves – as key elements in the transition from globalisation to new socialism.

By understanding the historical and structural limits of 'globalist ideology' we can escape the tyranny of globalism. The alternatives are not disembodied utopias that are 'imagined' by individuals sitting in front of the Internet. The alternative grows out of the past and present experiences and opportunities that emerge from the failures and crises of the 'export strategies'.

By focusing on social relations and the state as the building blocks of global empires we can escape the prison of globalist thinking and enter the realm of political and social action. The inversion of the policies of globalist ideologues leads to the formulation of an alternative strategy in which social mobilisation and state power provides a new class content to the shock treatments, industrial reconversions and structural adjustments. The new socialism learns not only from its capitalist adversaries how to turn the tables but it also learns from the mistakes of the old socialism. It is more inclusive incorporating women, consumers, ecologists. It possesses a greater sensibility to the notions of freedom at the workplace and on the farms. It possesses a greater appreciation of the consequential discourse that integrates personal values and public practice.

The collapse of globalisation, as it has been understood up to now in Asia, ex-USSR, Africa and Latin America, is creating tremendous hardships but it is also a historic opportunity to transcend capitalism. It would be a failure of the nerve to settle for anything less than a new socialist society, a new nation as an integral whole, a new culture of participants and not spectators and a new internationalism of equals.

Democracy and Communal Violence

Anirudh Deshpande

Community Conflicts and the State in India edited by Amrita Basu and Atul Kohli; OUP, Delhi, 1998; pp 287, Rs 525 (hardback).

SIX chapters of this volume were presented at a conference on 'Political Violence in India: The State and Community Conflicts' at Amherst College in September 1995. Three chapters reproduced in the volume by Kohli, Dasgupta and Katzenstein et al appeared as a special issue of the *Journal of Asian Studies* in May 1997 (vol 56, no 2). Since then the BJP has suffered major electoral reverses in Rajasthan, Madhya Pradesh and Delhi and the Congress seems to have regrouped under Sonia Gandhi. Combined with the growing countrywide disgust with the Shiv Sena (SS) these recent developments, taken together, could comprise a trend increasingly being reflected in contemporary journalistic writings. Most political commentators, observing these hindutva defeats, have started saying that probably we have seen the last of the communal violence of 1980s and 1990s. In this context the latest bullying of Christians in Gujarat and the desperate pronouncements of the SS chief resonate the frustration creeping into the ranks of the Sangh parivar. Clearly the reason for this lies in the failure of the BJP and its communal allies to saffronise totally the political processes characterising a pluralistic and democratic society.

However, these contemporary developments, which display hindutva on the defensive for the first time since 1989, do not diminish the salience of several generalisations made in the worthy volume under review. The book, which concentrates on democratic political institutions as most texts of Indian political science do, will also be viewed by its readers in the light of three developments which characterise the history of post-1947 India. The first is the general failure of the mixed economy model and the concomitant decline of Nehruvian socialism, secularism and other national values such as non-alignment. The second is the emergence of so-called liberalisation under the direct influence of the World Bank-IMF guidelines in the 1980s, its severe economic consequences and the rapid decline of the Congress as the most broad-based representative political organisation in India. Thirdly, the dwarfing of the Congress and its inability to contain and positively channelise the socio-economic forces unleashed by the logic of independence. This finally vacated an important political space for Hindu nationalism in Delhi and several Indian states. The book contains a lively discussion on community conflicts, communal violence, federalisation of the Indian polity, the rise and prominence of a majoritarian, exclusivist nationalism and the role of the Indian state in the above mentioned context. On the whole the volume refutes the primordialist bias entertained by certain analysts of ethnic conflicts. It suggests, rather discerningly, that *perceptible ethnicity and economic causes might provide only the necessary conditions* of social protest and conflict. The *sufficient conditions* for such phenomena are more often than not transparently political. Other social scientists, like the fabled blind men interpreting an elephant, may disagree but the distinction between the necessary and sufficient conditions in the causation of history incidentally augments the dialectical interpretation of the base-superstructure model.

The introduction to the book underlines its emphasis on politics and power. The problematic of community consciousness and derivative communalism in contemporary India is directly related to the declining Nehruvian state and the almost simultaneous growth of multifarious community conflicts. After independence, as the politico-economic project of the Indian ruling elite began to fail, the combination of an increasing "normative and organisational vacuum" and the "intensification of democratic politics" paved the way for the emergence of community mobilisation on multiple lines. The 'us versus them' problem characterising Indian society today can hence be located in a political context which redefines ethnicity in specific regional, linguistic or caste interests articulated by subnational and national elites. The editors define 'political conditions' as the 'nature and actions of the state on the one hand, and power competition and movement of politics on the other hand". Consequently the chapters of the volume are supposed to "address the interaction between the state and politics... and the emergence, intensification, transformation and/or decline of community identities". The chapters manage to achieve this objective with a certain amount of academic rigour not usually associated with contemporary political writings.

In the first chapter Atul Kohli tries to answer the question whether democracies can accommodate ethnic nationalism with reference to a model based on the rise and fall of self-determination movements in India. He asserts that the nature of western democracy is different from that in the developing countries and this difference, evident in the culture, polity, economic development and enhanced state intervention in social life is responsible for the emergence of ethnic nationalisms in the latter. On the whole the "introduction of competitive elections and mass suffrage amidst weak institutions will repeatedly generate expansionary political pressures in these democracies, that is pressures towards a more equal distribution of power in society". This probably explains "why democracy in developing countries tends to be as much a source of, as a solution to, power conflicts". In addition, the rise and future of self-determination movements also depends upon the degree of the institutionalisation of central authority and leadership strategies. On the basis of this assertion an inverse U curve model of ethnic movements is constructed by Kohli. The model comprises (a) a highly institutionalised central state, (b) an accommodating ruling strategy and, based on these two, (c) a self-determination movement plotting an inverse U curve.

In short, in situations where the central leadership is willing to give important political concessions to localised self-determination, such movements start reach the point of negotiations, get exhausted in the process and finally decline and end. In contrast the author cites the example of weakly institutionalised Czechoslovakia and Nigeria in a table which illustrates the model with examples. However, in this reviewer's opinion, a historical comparison with the over-centralised former USSR – which could never resolve its nationalities problem despite impressive socio-economic development – would have added greater weight to Kohli's pragmatic submission. The author examines his model with reference to three well-known case studies in India and, after a brief survey of the better known political events associated with Tamil, Sikh and Kashmiri

nationalism since the 1950s, arrives at the conclusion that Indian democracy can accommodate ethnic nationalism. That may well be true but the model presents four main problems.

Firstly, despite the installation of the latest National Conference government in Kashmir it is difficult to predict the future of ethnic nationalism in the valley. Secondly, a compromise with a regional subnationalism often opens the door to more compromises with subregional self-determination movements based on tribal and other identities. The peculiarity of this problem, highlighted in the case of the north-east, is addressed by another chapter in the volume analysed below. Thirdly, the centre usually compromises with regional elites leading self-determination movements. But in the long run this political strategy of elite-elite compromise can run into rough weather as the hegemony of the regional elite over ethnic groups breaks down. Faced with this frightening prospect what options are the ruling classes left with? Finally, on the basis of recent history, it can be asserted that the Indian state's extra accommodation of Hindu nationalism has weakened its democratic nature and heightened the insecurity felt by the religious and other minorities. How regimes address this problem in future remains to be seen.

The second chapter on religion, reservations and riots and the politics of ethnic violence in India by Sunita Parikh contains a good account of the Mandal controversy and a capable overview of the Mandal-Masjid riots in Gujarat, Bihar, Karnataka and Delhi. The author travels on familiar territory while narrating an important story of social strife in our times. However, from the viewpoint of developing social science theory, the most interesting part of her paper comprises a discussion on the meaning of 'ethnic nationalism'. She draws upon the specialised work of Connor and Brass to explain the difference between the primordial notion and political concept of ethnicity. Connor has asserted the autonomy of ethnicity in his work whereas Brass suggests that ethnicity is more instrumental than primordial. Hence ethnic nationalism, in general, means the manipulation of symbols by national, subnational and subregional elites. This, to interpret Brass further, leads to identity formation under, what Gramsci would have called, elite hegemony. This interpretation of ethnic nationalism, or even nationalism *per se*, would substantiate the notion of false consciousness entertained by Marxists since the 19th century. That is so because nationalism tends to build on identities which are usually not based on the location of individuals in the mode of production.

But Parikh's paper is disappointing in some ways. On page 38 she asserts that reservations for scheduled castes "do not cause much antagonism on the part of other Indians because the full quota of reservations is almost never utilised, so competition over scarce resources is rarely a problem". This is factually incorrect because reservations for scheduled castes has always been an important issue of caste mentality in the Indian middle classes irrespective of quotas being filled. The upper caste Hindus have, in general, believed that Congress governments have pampered the scheduled castes by giving them job reservations, age relaxation and easy promotions, etc. On page 40 the author claims that "Devi Lal brought into the National Front a critical and highly coveted vote bloc: lower caste small-scale farmers in north India". This description is incorrect. Devi Lal, as everyone knows, is a jat leader of Haryana and the backward jats are not 'small-scale farmers'. On page 41 we find the BJP mentioned as a member of the National Front in 1990 whereas the BJP, as Parikh's source the *India Today* would easily affirm, was merely extending support to V P Singh from outside. Similarly on page 45 the central government is casually called 'national government'. On page 42 a confusion arises with reference to the Mandal controversy. The author asserts "that the majority of Indian public opinion supported the implementation of the Mandal report". It is unclear whether she is referring to public opinion as it appeared in the highly biased media reporting of those days or the public in general. Furthermore, had the author set her arguments in the context of liberalisation, the dislocation of the Nehruvian system, growing unemployment and social anxiety in the 1980s her conclusion that the BJP has succeeded because of the choices made by the Congress would have appeared more relevant to the discussion.

Chapter three 'The Politics of Processions and Hindu-Muslim Riots' by Christophe Jaffrelot is based on the line of his reputed work 'The Hindu Nationalist Movement in India' (Paris, 1993; Viking 1996). The main hypothesis of the author, following Brass, is that "the instrumentalisation of religious processions by ideologically minded leaders largely explains the way these rituals have become conducive to communal riots". The concept of crowds dissolving into a state of *communitas* opposed to selected targets dovetails into this process. To begin with, Hindu nationalists like Tilak used religious processions as 'unitarian mobilisations' which promoted an aggressive identity formation amongst Hindus. From there the transition to violent communalism was only a step away. During the colonial period leaders like Moonje, Hedgewar and Madan Mohan Malviya played an important role in developing the technique of processions. These political leaders with "Hindu militant leanings invested this procession with the purpose of strengthening the majority community *against* the Muslims" (emphasis in original). After independence the pattern of communal mobilisation around symbols, processions and potential violence was routinised. This led to a phenomenal increase in procession and yatra politics and associated communal violence. The Indian state made matters worse by becoming partisan during communal situations and riots and not punishing biased officers. To combat communalism it is significant to note that Jaffrelot calls a spade a spade and concludes that given sufficient political will communal violence can either be prevented or easily put down.

The next paper 'Community and Caste in Post-Congress Politics in Uttar Pradesh' by Zoya Hasan reproduces some of the important arguments presented in her book *Quest for Power: Oppositional Movements and Post-Congress Politics in Uttar Pradesh* (OUP, Delhi, 1998). She carries forward Jaffrelot's thesis regarding the salience of congregations, processions and pivotal symbols to communal politics while explaining the rise and limitations of hindutva in UP. The Ayodhya movement, we are told, was primarily political although history was harnessed to it by the communal ideologues. But the movement was assisted by the pragmatic communalism of the Congress. Hence hindutva reached its peak in UP during 1990-92 when the "anti-Mandal and Ram Janmabhoomi schemes were conflated in the service of an implicit class strategy of domination". But the limitations of the Sangh parivar are stated in the following words: "The rise to power of the OBCs accompanied simultaneously by an autonomous mobilisation of dalits constitutes the biggest impediment to the ideological and political expansion of Hindu nationalism."

The fifth chapter on the evolution of the party system in Tamil Nadu (TN) by Arun R Swami, based on his doctoral work, is a refreshing account of contemporary Tamil politics. The party system in TN developed in two stages. The first was the consolidation of a broad-based Tamil sentiment against the brahmin (read aryan

and north Indian as well) domination of Tamil society. This movement for the empowerment of the Tamil nation was pioneered by the Justice Party and resulted in the formation of the DMK. The second stage comprised the split in the DMK and the emergence of the protectionist MGR-led AIADMK. Swami lucidly narrates why this occurred and how the politics of 'empowerment populism' versus 'protection populism' came to underscore a stable two party-system in TN. The distinction between empowerment and protection is crucial to understand the rhetoric and substance of ethnic nationalism. The lessons are evident in the success of the MGR phenomenon. The success of this star-turned chief minister was predicated upon the realisation that without specific economic content populism cannot go very far. Hence the MGR regime paid special attention to welfare schemes, subsidies, prohibition and women and their problems. However, Swami's submission that TN presents a paradigm towards which the rest of India is gradually moving is problematic. The two-party system could evolve in TN primarily because of the historical, social and geographical peculiarity of that state. This made the historical contradiction of Tamil society and its alienation from aryan domination almost unique. Can this be repeated elsewhere in India? Given the current socio-political conditions in states like Bihar, UP, MP and Rajasthan it is difficult to see two consistent historic blocs, represented by two parties, emerging in the near future.

The sixth chapter on the rise and fall of democracy in Jammu and Kashmir by Sten Widmalm presents a challenging account of the democratic process in the state since 1947. Although the paper treads familiar ground some of its generalisations are worth noting The paper makes it clear that between 1977 and mid-1980s the political conditions in Kashmir "did indeed breed integration". Even the JKLF sources point out the futility of starting a secessionist movement in the early 1980s. But democracy declined in the period 1983-89 due to the problems which surfaced in the National Conference after Sheikh Abdullah's death in 1982 and the ambitions of Indira Gandhi and her slaves like Jagmohan. In short, therefore, the failure of the elite in New Delhi and Kashmir together put paid to the democratic process in the state and opened the floodgates to militancy.

Matters became worse when Farooq Abdullah foolishly allied with Rajiv Gandhi during 1986-87 to create an unpopular political cartel in the valley – called 'consociationalism' by the author. Once the liberal opposition to the Congress vanished and the democratic expression of Kashmiriyat was throttled the fundamentalist elements became prominent. These developments present a classic demonstration of a democratic decline caused by elite shortsightedness. The state also shows that although the consistent neglect of socio-economic development can cause conflicts poverty does not automatically lead to violence. The sufficient conditions necessary to spark off insurgency are political because democracy, beside fair elections and legitimate opposition, also means observance of institutional fidelity and the universal applicability of the rule of law. If these decline, a combination of charisma, myopia, nepotism and corruption destroys civil society altogether.

The seventh paper by Jyotirindra Dasgupta on community, autonomy and insurgency in India's north-east is an excellent story of working federalism in a lesser known context. It is true, as Dasgupta contends, that the region has suffered a negative media representation and the excessive attention to regional violence has sidelined a fair democratic process. No doubt the area has specific problems because of a high concentration of tribal population and large-scale migration from Bangladesh. But the reconciliation of the AGP to the Indian Union and the Assam Accord of 1985 undermines any canard against the Assamese. More problems in Assam arose because the AGP failed to deliver on an agenda crafted during its anti-New Delhi movement. Hence ULFA phenomenon was produced more by the failure of the Assamese middle class than by a secessionism popular among the Assamese in general. Furthermore, the Assamese government was later accused by other linguistic-ethnic groups, namely, the plains tribals [Bodos], of promoting Assamese chauvinism. This repeated a familiar cycle with federal authority being called in to sort out inter-ethnic conflict. In the ultimate analysis the Bodo Movement, Bodo Accord of 1993 and connected violence highlights the self-defeating nature of ethnic nationalism in an "ethnically plural context".

How will this inter-ethnic conflict end? According to Dasgupta the Bodo experience and the concept of granting tribal groups autonomy within a federal structure, evident in the creation of large tribe-dominated states like Nagaland, Meghalaya and Mizoram, offers a solution. The model presents a co-ordination of federal, state and sub-regional district and regional councils for a balanced economic, political and social development of the country. The system conceived by Indian policy-makers is perceived as dynamic. It evolves in accordance with emerging regional sub-regional and tribal demands for the decentralisation of power. We can add 'panchayati raj' for good measure to complete the picture of India's federalising polity. The Sixth Schedule of the Constitution, the 73rd Constitutional Amendment and other such constitutional and administrative provisions should be viewed in this context. But how far can the accommodation of ethnic nationalism go? To what extent can compromises be made with the elite within these ethnic groups? In answering these questions the danger of seeing too much in the politico-administrative model sketched above probably cannot be avoided. Maybe, the only long-term solution to these intractable 'ethnic' problems lies in economic and industrial development, urbanisation, education, growth of cosmopolitanism and a recasting of social conflict possibly in terms of classes and their representative parties.

However, chapter eight of the rebirth of the SS in Maharashtra seems to disqualify the thesis of urbanisation. The growth of the discourse and organisation of the SS in India's most industrialised state shows that tribals and peasants are not indispensable to the flourishing of ethnic nationalism. The authors, Mary Fainsod Katzenstein, Uday Singh Mehta and Usha Thakkar, clearly establish the rise of the SS in a context comprising critical Congress, business and state failures in Maharashtra. The historical conjuncture of the 1980s and the emergence of popular hindutva focused on the demonisation of Muslims in much of north and western India propelled the SS from the margins of mainstream politics to its centre in one of India's richest states. However, the SS could utilise this historical opportunity because since 1966 its organisational structure, often encouraged by the anti-leftist forces in Bombay, had grown virtually unchecked in Maharashtra's industrial belt. Hence when the communal moment arrived the SS was ready for it. This analysis reinforces two salient generalisations upheld by historians and made throughout the volume. Firstly, the fact that communalism is conjunctural and primarily political and secondly, its growth is predicated upon the neglect of law and democratic institutions in civil society.

On the whole the book is stimulating but future editions could do without some errors. For instance, the page on Abbreviations expands LTTE into Liberation of

Tamil Tigers Eelam whereas it should be Liberation Tigers of Tamil Eelam. On page 126, in Swami's article, the mistake is repeated. The NC is expanded to mean the Jammu and Kashmir National Congress (!). Probably what the editors, following Widmalm's contribution, imply is the National Conference. The Glossary also requires revision. The Arya Samaj, for example is called a "Hindu reformist organisation". So is the RSS, then what is the historical difference between the two? Some details should have been provided. The word 'firangi' is translated as foreigners whereas a more appropriate, though not exact, phrase would have been 'white foreigner'. The 'burkha' [should be 'burqa'] is called a "long garment with headpiece which can cover the wearer from head to foot". The phrase 'worn generally by Muslim women' should have been added. The word 'lathi' is said to mean a stick. But lathi, in common parlance, is a specially prepared weapon often tipped with metal. The apposite world would have been a stave. Finally 'varna', most unfortunately, is translated as caste and 'yajna' as sacrifice. For the former the phrase 'theoretical vedic-Hindu social order' could have done and for the latter 'vedic invocation of gods' would have served better. After all the word for sacrifice is 'bali' which a particular yajna may not necessarily involve.

Economic Geography of Global Capital

Buddhaheb Ghosh

Spatial Dynamics of International Capital: A Study of Multinational Corporations in India by Swapna Banerjee-Guha; Orient Longman, Calcutta, 1997; pp xiii + 285, Rs 300.

EVER since the industrial revolution the individual closed economies of the world have been integrating into the world economy through trade in goods and services. During the initial phases, before the full-fledged spread of imperialism, trade used to take place in one's own chosen lines of production which evolved over centuries of 'autarkic' development. Over a long period progress in industrial and agricultural production could not easily cross national boundaries due to numerous hindrances. That is, there was long-run hegemony over very selective commodity production due to technology advantages even at a rudimentary level across countries. The major advantages from such closed world production system used to accrue to those nations that pioneered in developing the required technology for the production of an ever-increasing list of goods. But development of modern means of transport created the grounds for making significant inroads into the closed nature of world economy. Although such specialisation was, to start with, determined by (1) availability of resources and (2) command over information and technology, the progress of large-scale machine industry stimulated a rapid growth of production, and created the need to search for newer sources of raw materials and market. The late 19th and the first half of the 20th century witnessed a spectacular expansion of railway and road network in most countries; and the same time, the merchant-marine tonnage increased sharply as steamship replaced sailing vessels [Kindleberger 1996].

The world market that emerged in the 16th century as a result of great geographic discoveries became the 'third component' of the world economy. With the development of capitalism, Europe, North America and North Africa were integrated into the world economy at a faster rate through international trade. It was world trade in goods and services first, and the world market that ushered in the 'new history of capital'. There are two basic kinds of geographic division of labour: international and interregional (within a country). As market for capital in an individual developed capitalist economy was saturated, stimulating growth of large-scale industry along with patented technology caused the flight of capital – the most scarce resource in the other world – from the advanced to the backward nations. As a result, employment opportunities for skilled labour increased substantially. This called for people to migrate from backward to advanced countries and from poorer to advancing regions within the backward countries. Hence, the development of technology and saturation of market (for both commodities and capital) in the capitalist countries helped the division of labour to cut across national boundaries. This transboundary nature of capital in association with division of labour consists in individual countries' specialisation in the production of certain products, and in exchanging them for others. This international division of means of production and distribution has had both progressive and retrogressive repercussions upon further development of an economy. History of international movement of capital in recent centuries simply proves its inevitability in shaping the technological evolution of a society. For example, the rise of Korea, Hong Kong, Taiwan, Malaysia and the like in the second half of this century is a very recent testimony to this hypothesisation. However, far from being guided by co-operative motives the main motivation behind such mobility of capital is the conventional rationality of profit maximisation on the part of the owners of capital. Naturally then, the partners being highly unequal in knowledge, information and capability, the 'exchange relationship' between the multinational corporations and the host country firms (even if public companies) is basically unequal. One interesting point very often missed by researchers in the LDCs is that economic significance of foreign multinational corporations (FMNCs) doing large-scale business even in developed country markets has increased rapidly since the 1970s [Friedman, Gerlowski and Silberman 1992].

The book under review addresses some of these issues in the context of MNC activities in India during the last few decades. The most notable aspect of the book is that a geographer writes it. Such an attempt has been due for a long time. In the author's own words, "This is a book about the spatial relation of international capital. More precisely, about the operations and organisations of multinational corporations – one of the most important organisational forms of international capital – with special reference to India as a host country during the late 1980s and early 1990s." The limited role of research in geography, or for that matter in economic geography, in India is very understandable at a time when Paul Krugman (1989) accuses the trend in the mainstream economics in a recent article as follows: "Even now not one of the best selling introductory textbooks in economics contains a single index entry for 'location', 'space', or 'regions' (most do not even contain an entry for 'cities')". I must not avoid mentioning that in the present book the required emphasis on geographical aspects of international capital, which could be very fruitful, is sadly lacking here.

This is not a bextbook, rather a sort of research outcome. Hence it is better-evaluated chapter by chapter. There are six

›road chapters. The first chapter discusses :he significance of MNCs in the world :conomy by pointing out the spatial scale of the expansion of MNC activities. While going beyond the limits of India, one section looks at the geographical spread of MNC activities during the post-1970 periods. Even without undermining the novel attempt of the author, the most obvious lacunae of this chapter is that the approach is too naive to raise some emerging issues in the field of host country's evolution of industrial activities as a result of MNC operations.

The second chapter deals with the organisation and operation of the MNCs in the light of sector and space. Here the area covered is commendable. It is analysed at length how the MNCs resort to various tricky strategies to evade taxation; by-pass export endeavours and thus affect the balance of payments negatively. But a potential for empirically showing the interaction between the rationality of the MNCs and the host country 'interest' has been lost. Here the author reached close to the very recent branch of 'new trade theory', and suddenly got into the third chapter. According to the author, this chapter seeks to explore the dynamics of foreign direct investment in India during the post-1947 period. Unfortunately, the analysis is mainly confined to the 1970s and 1980s. One major weakness of this chapter is the complete silence on technological characteristics of different product lines from MNCs of different countries in the context of domestic technology.

The significance of chapter four cannot be exaggerated even in the post-reform period. It deals with spatial dynamics of MNC operations in India. A detailed analysis is done with regard to the regional distribution of MNCs in India. But no attempt is made to search for the factors leading to such biased distribution of FDI. Apart from addressing the unequal infrastructure facilities across the states, which have been worsened in the post-reform period, the author could have considered the role of locational factors in shaping external economic events. At a time when liberalisation and globalisation have become integral parts of domestic economic policy there is tremendous potential for future inter-disciplinary research in this area. And above all, it could play a strong positive role in influencing public policy for curing rising regional disparity.

Chapter five deals with the expansion of foreign capital in the consumer goods sector in India with special reference to two giant corporations, Proctor and Gamble, and Unilever. It has also touched upon the impact of expanding consumer goods production by the MNCs on the regional sociocultural variables. But it has failed to touch the factors leading to abrupt rise in MNC-induced 'consumerism' even in regions with widespread poverty.

Finally, chapter six highlights the basic points in the trajectory of uneven development in India's spatial economy. One crucial limitation of this chapter is the period of analysis. It unfortunately ends in 1991. Recent studies in the post-reform period have shown that while there is tremendous regional disparity in the degree of openness across the states, foreign capital investment has largely aggravated the rising income disparity through further concentration of industrial activities in selected regions [Ghosh and De 1998]. One thing is clear after nearly a decade of half-hearted reform that the rhetoric of anti-liberalisation will be ultimately responsible not only for rising inequality of private manufacturing investment, but also for rampant migration of human capital (engineers, MBAs, CAs and scientists) away from the losing to the gaining regions. The latter factor has much more positive impact upon the 'confidence' of the prospective investors. That is, if the spatial geography is the 'first nature', then the second nature of subsequent human settlement creates conditions which are conducive for further unevenness.

Banerjee-Guha's book is addressed to researchers from both social science and Indian geography. But the major limitation of the book is that it is silent on policy implication. As is well known, choice of investment location of the MNCs is determined by the strength of market, availability of raw materials, infrastructure facilities, labour market conditions, state promotional efforts, real estate rates, state and local personal taxes and the like across regions. Moreover, there may be significant variations among Japanese, European and American investors in their choice determinants. No light is thrown on either of these issues. We should expect the author to address them in future writings.

Consumption of Gold in India

Trends and Determinants

A Vaidyanathan

The gold stock of the country at the end 1997 was close to 10,000 tonnes valued at current prices on the world market at $ 120 billion. This is nearly four times the country's exports and official foreign reserves in that year. The continued rapid growth of gold inflow into the country can have significant consequences in terms of the scale and functioning of the hawala market, the availability of foreign exchange for other uses and the health of the balance of payments. The factors determining the demand for gold and the sources of finance for importing it therefore merit closer study.

I
Trends in Consumption: An Overview

INDIA produces hardly any gold; but it is the second largest consumer of the precious metal in the world. The only important gold mine in Kolar has been contributing a miniscule proportion of total annual absorption. Practically the entire demand is met from imports and recycling of previously accumulated stock and scrap generated from it.

The country has long been importing substantial amounts of gold: Between 1831 and 1931, imports averaged 37 tonnes per annum. The 1930s – the period of the great depression – were marked by an exceptionally large net outflow of gold averaging around 140 tonnes a year. This tendency was reversed during the following decade, when there was a net gold import of around 31 tonnes per annum. Thereafter, despite the imposition of a ban on gold imports in 1947, net imports (practically all of it illegally smuggled) increased progressively to 80-90 tonnes per annum during the 1950s, and close to 150 tonnes per annum during the 1960s and early 1970s. After a sharp decline in the 1970s, gold imports surged again during the 1980s and, following the lifting of the ban and permitting of imports in 1992, the rate of imports increased sharply in the 1990s (Table 1).

A rough[1] picture of overall picture of gold consumption and sources of supply during the 1990s is given in Table 2. There was a big spurt (about 80 per cent) in estimated consumption following the liberalisation of gold imports in 1992. Consumption seems to have remained around 400-425 tonnes in the next couple of years before resuming the rising trend. Estimated consumption in 1998 was more than thrice the level recorded in 1990 and nearly 70 per cent higher than in 1992. Domestic gold scrap is estimated to have met nearly a fourth of the demand in 1990. The scrap supplies, accoridng to trade estimates, has remained more or less stable in the past. Allowing for a 3 per cent annual increase in scrap availability - in the present state of knowledge this can be no more than an guestimate[2] – an increasing share of the demand has been met by imports.

Till 1991 practically all these imports were obtained by smuggling. But with liberalisation, the share of smuggled gold has progressively declined both in absolute terms (from an estimated 290 tonnes in 1992 to 94 tonnes in 1998) and even more so in relation to total consumption (from over 70 per cent in 1990 to less than an eighth in 1998), This decline is the direct result of progressive liberalisation of gold imports, (subject to payment of a 15 per cent duty) and a considerable narrowing in the margin between international and domestic price of gold. This margin in 1998 was close to the import duty on gold. Note however that the volume of smuggling (90-100 tonnes a year) remains quite large: A smuggler who successfully escapes the customs net still stands to make a substantial profit!

II
Economic Impact of Gold Imports

Gold, by itself, does not add much to production or productive capacity. However the foreign exchange used for importing it in effect reduces the availability of this resource for other imports (including raw materials, intermediates and capital equipment) needed for current production and expand productive capacity. In the Indian context, the magnitude of foreign exchange expended on gold imports has been large and growing. In 1970, India's imports, at the prices prevailing in the world market at that time, would have cost 2.2 billion US dollars, equivalent to about one-eighth of merchandise exports and 8 per cent of merchandise imports. The corresponding figures for 1997 being 7.5 billion US dollars (equivalent to about a fifth of exports and one-sixth of imports).

Prior to 1992, gold imports, being illegal, were financed by the proceeds of under-invoicing of exports, over invoicing of imports, earnings of migrants workers remitted through hawala channels and smuggling of silver and contraband drugs. These transactions did not figure at all in the country's trade or payments statistics. After 1992, the value of legal gold imports cleared through the customs are included as part of merchandise imports in the balance of payments data (but not in trade statistics), an equivalent amount being recorded as transfer receipts under 'invisibles'. The nature and

Table 1 Net Import of Gold into India *(Tonnes)*

Period	Total Quantity	Annual Average
1831-1931	3700	37
1931-40	(-)1400	(-)140
1941-50	311	31
1951-57	653	93
1958-63	520	87
1964-67	720	180
1968-73	815	136
1974-80	160	23
1981-90	1550	155
1991-97	2792	399

Notes. (1) Figures for 1831 to 1940 based on official trade statistics During this period import and export of gold was legal The figures cited probably relate to undivided British India

(2) Gold imports from late 1940s till 1990 are estimates of Consolidated Gold Field and Gold Field Mineral Services as cited in Sarma et al op cit For subsequent years estimates of World Gold Council Except for imports through officially approved channels (mainly of facilitate exports of ornaments and jewellery), imports were illegally smuggled into the country

Source: Sarma et al (1992), 'Gold Mobilisation as an Instrument of External Adjustment. A Discussion Paper', RBI, Bombay 1992, Tables 1 and 5. For the 1990s World Gold Council estimates (see Table 2)

sources of the latter are not indicated for lack of information. Clearly they, as well as the resources needed for the still substantial smuggled gold, must have been derived from one or the other of the extra legal sources cited earlier. Possibly their relative importance has changed. In effect the hawala market continues to operate but with indirect legal sanction given by the gold import policy.

The magnitudes involved are large in relation to the size of the country's foreign trade and payments: The gold stock of the country at the end 1997 was close to 10,000 tonnes valued at current prices on the world market at $ 120 billion: This is nearly four times the country's exports and official foreign reserves in that year. Their continued rapid growth can have significant consequences in terms of the scale and functioning of the hawala market, the availability of foreign exchange for other uses and the health of the Balance of Payments. The factors determining the demand for gold and the sources of finance for importing it therefore merit closer study.

The other characteristic of gold is that it is a highly liquid store of value. It represents command over resources both at home and abroad which can, in principle, be invoked whenever necessary. Its physical depreciation is negligible; and it can be readily converted into cash by sale in the world markets for acquiring other resources both at home and abroad. Though it does not earn any interest and though it is not any longer used as the standard for fixing currency values, the fact that there is a well developed world market for the metal and that its prices have until recently increased much faster than the general price level makes it a particularly attractive asset.

Insofar as gold is used as an ornament, it can be treated as a durable consumer good. But this function does not in any way dilute its advantages as a liquid, risk-free asset. In any case, not all gold is held in the form of ornaments; a part (perhaps a large part) -- no one knows how much -- is held as hordes of bars. Altogether, from the country's viewpoint, gold holdings, whether as bars on ornaments, are no different from foreign exchange holdings. That the bulk of it is in the hands of private individuals who may or may not be willing to convert it into other assets is another matter, and does not detract from this feature. Of course it is important, in such a context, to understand why people prefer to hold gold and the conditions under which they will add to or reduce the stock of it in their hands.

If accumulating gold, in principle, is no different from accumulation of foreign exchange reserves or investment in foreign financial assets, then they must properly be counted as part of the economy's savings. The more so because investment in gold is, in a real sense, a substitute for investment in other assets. It is significant that during the last few years, the value of additions to gold stock accounts for over 20 per cent of the private non corporate sector's investment in financial assets. Also this proportion has been varying: from about 31-32 per cent in 1970, it fell to a low 2 per cent in 1979, but has since risen more or less progressivley to reach 22-23 per cent in 1996-97 (Figure 1).

Exclusion of gold from the estimates of domestic savings thus understates the household and overall domestic savings rate, and this bias has been increasing in the last 2 decades. Thus during the early 1970s the household savings including gold averaged around 12.2 per cent compared to 11.4 per cent as per official estimates; the difference is much narrower in the early 1980s the respective rates being 14.1 per cent and 13.5 per cent respectively; but thereafter the divergence increased. During the mid-1990s (1994-95 to 1996-97) the household saving rate including gold averaged 21.6 per cent compared to 19.8 per cent excluding gold. This again emphasises the importance of including gold accumulations as part of domestic savings and focusing on the factors determining their level and disposition.

III
Factors Determining Gold Imports

Surprisingly there are few systematic studies of these issues. The only work which attempts to explore them, and is available in the public domain, is a paper published by the Reserve Bank of India in 1992 [Sarma et al 1992]. Its primary purpose was to suggest ways in which in the short run, "gold already in the possession of the household sector" could be mobilised and used to "release external constraints" and, in the long run, "eliminate incentives for unofficial imports by narrowing the price differential between international and domestic markets" and to "influence the asset preferences of households in favour of productive use of capital" (ibid). In the process it provided a useful compilation of available data on production, imports and prices of gold, discussed the factors affecting the supply of and demand for gold and even attempted to empirically estimate supply and demand functions.

The study identified the following major factors influencing demand: the price of gold, 'rural surplus' and rural income distribution, magnitude of 'black' income generated, rate of return on alternate financial assets and the general price level. The relevance of the price of gold and returns to alternative investments is obvious enough. Rural surplus not defined by the authors and income distribution were seen to be a function of irrigation and technological change. As the latter spread, marketed surplus and hence 'rural surplus' increases and generates "a highly skewed income distribution". All of which lead to higher demand for gold. Fertiliser consumption was used as a proxy for these factors in the estimated demand function.

The authors further argued that much of black income, which is an important source of demand for gold, "looks like originating in the services sector rather than in commodity producing sectors". Therefore the income generated in the services sector was used as a proxy for black income. The general price level was expected to reduce the demand for gold by reducing the purchasing power for acquiring jewellery and reducing the real return on gold. These effects were, it was argued, likely to more than offset increased skeweness of income distribution as a result of inflation.

Table 2: Trends in Gold Consumption after Liberalisation

(Tonnes)

	1990	1991	1992	1993	1994	1995	1996	1997	1998
1 Total demand[1]	236	260	454	424	415	477	508	737	770
2 Less:scrap[2]	60	70	70	70	70	71	75	75	76
3 New gold (1)-(2)	176	190	384	354	345	406	433	672	694
4 Official imports[3]	6	40	95	114	178	249	298	526	600
5 Non-official imports[4] (3)-(4)	170	150	289	240	167	157	135	146	94

1 Total demand figures from World Gold Council gleaned from newspaper reports. 1998 figure adjusted to annual basis using data for first three quarters and assuming fourth quarter demand to be slightly above the third quarter figures.

2 Sarma et al (1992) give estimates of scrap for 1981 to 1990. The figure is more or less constant around 50 tonnes during the 1980s The figure for 1990 is 60 tonnes. For other years the difference between the World Gold Council estimate of total demand and total gold imports as given in Table 3 is taken to be met by scrap.

3 Figures of official imports from 1992 based on WGC estimates. 1990 official imports were negligible (6 tonnes); 1991 figures derived as difference between total gold import and unofficial imports.

4 Unofficial imports for 1990 and 1991 as given in Sarma et al (1992) (based on estimates of Consolidated Gold Field and Gold Field Mineral Services Ltd). For other years derived as difference between total imports and official imports

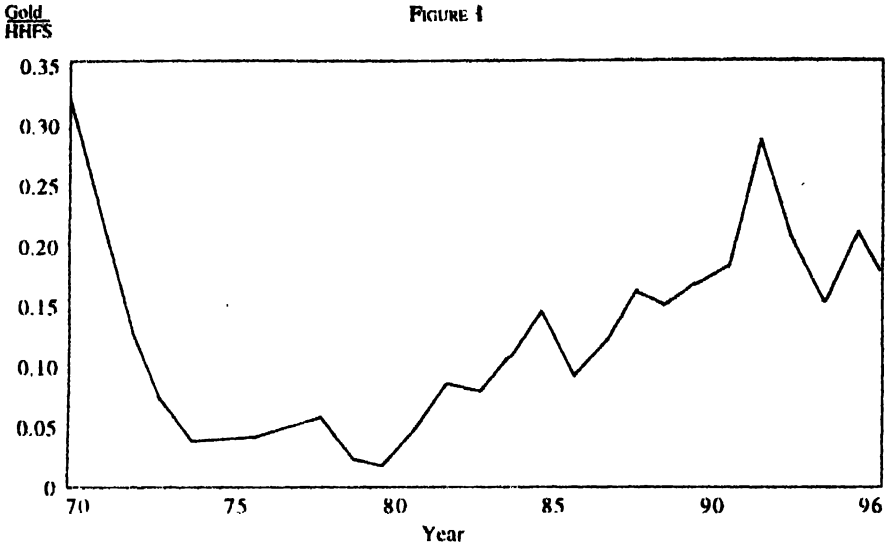
Notes and Sources:

Gold Imports	Volume of gold imports up to 1990 as reported in Sarma et al 1992; for subsequent years World Gold Council estimates culled from newspapers The figures relate to calendar years, e g, 1970-71 related to 1970.
GDPR	Gross domestic product at factor cost (80-81) prices as reported in National Income Statistics.
GDPN	Gross domestic product at current market prices.
GDSN	Gross domestic savings at current prices.
HHSN	Gross household savings at current prices.
Gold Price	Average price per 10 gms in Mumbai and London as compiled.
Value of Gold	Value of imported gold in rupees at domestic price.
GDPDF	Implicit GDP deflator 1980-81 = 100
IGDP	Index of domestic gold price 1980-81 = 100
IOSP	RBI index of ordinary share price 1980-81 = 100
Gold Price rel to GDPDF	Ratio of index of gold price to implicit GDP deflator.
REL TO IOSP	Ratio of the index of gold price to ordinary share price index.
MARG	Ratio of difference between domestic and foreign price of gold relative to foreign price.
HHSN/GDPN	Household savings as per cent of gdpn.
HHS/GDS	Household savings as per cent of total domestic savings.
RI	Value of gold/(hhsn+value of gold) 'gold consumption as a per cent of total hh savings (including gold).

Figure 1



Gold Value/HHFS

The econometric estimate of the demand function using the above variables yielded poor results: When fertiliser consumption and service sector income entered separately in the estimated equation, the coefficients were found to be significantly positive. But when both figured in the equation, the coefficients were not significant. Wholesale prices had a significantly negative coefficient in all specifications. The higher the WPI, the lower the gold imports. The coefficient for gold price was significantly positive implying, contrary to expectation, that higher the gold prices, the higher the demand for gold. Returns to other financial assets were reported to have no significant relation to gold demand [Sarma et al, op cit, pp 6-8, 38].

The supply of gold, being almost entirely from smuggling, was seen as a function of the differential between its domestic and international price (reflecting the potential profit from smuggling), the premium in exchange rate prevailing in the hawala market relative to the official rate (reflecting the cost of acquiring the necessary foreign exchange through illegal channels) and the quantum of inflows in the form of FCNRs deposits and remittances (presumed to be inversely related to the supply of foreign exchange in the hawala market) (ibid:12-13,39). The multiple regression of gold imports on the above variables covering the period 1970 to 1990 confirmed the expectation that the higher the differential between domestic and foreign gold prices, and the lower the hawala premium, the larger the gold imports. The coefficient for foreign currency deposits and remittances turned out, contrary to expectations, to be positive.

The above hypotheses regarding the determinants of gold imports as well as the manner in which they were tested leave room for improvement in several respects. In the first place, consumption demand for gold (as ornaments) depends not only on agricultural prosperity and the distribution of agricultural incomes but also on non-agricultural incomes and their distribution. It is possible that the preference of agricultural and non-agricultural population for ornaments differ, but little is known about this. Nor are any reliable time series of income distribution available. Under the circumstances, at the very least, it would be better to use overall real GDP rather than indirect and questionable proxies (like fertiliser consumption) for agricultural incomes alone.

Second, insofar as gold ornaments are viewed as durable consumer goods, the price of gold relative to the general price level would influence demand for (and therefore imports of) gold. One might expect that the higher the price of gold relative to prices of other commodities and services consumed, the smaller will be the demand for gold.

Third, insofar as gold is sought and held as asset, the demand for it might be expected to depend on the volume of savings. For a given level of GDP, the higher the savings rate, the higher is likely to be the demand for gold. Neither government nor public and corporate enterprises invest in gold. Therefore, household saving would be more relevant in determining gold demand than the overall domestic saving rate.

Savings can be used to buy gold, acquire other financial asset or invest in physical assets. The demand for gold for any given level of GDP and saving rate will therefore depend significantly on the allocation between these forms of assets. It seems more likely that investment in gold will depend on the magnitude of saving in the form of financial assets than of total savings. The allocation of financial saving between gold and all other kinds of financial assets depends among other things on the relative returns of these two categories of assets.

Financial assets differ in terms of liquidity, the extent to which they provide a hedge against inflation, the risks involved and the rate of return after adjusting for taxes and changing market price of assets. Gold is almost as liquid as currency, and much easier (and less costly) to dispose of than other financial assets. If gold prices rise faster than the general price level (and the prices of financial investments), investment in gold will be seen as a superior hedge against inflation and preferred for that reason.

Many financial assets (like currency or bank deposits or provident funds) offer little hedge against inflation. Some others (like ordinary shares) do. Where there is a well functioning market (as in the case of shares and securities) and volume of financial investments available in the market is large relative to the savings, the attraction of gold would be significantly influenced by behaviour of its price relative to that of securities.

Yet another relevant consideration could be that incomes from financial assets attract tax and are more difficult to hide them than gold. Though gold does not give any current income, it is easier to conceal from tax authorities. Where the incentive to evade taxes is higher (because of high tax rate and/or lax administration), the attraction of gold is likely to be higher. The attraction would be stronger when gold prices move at least as fast as the market price of other financial instru-

Table 4: Estimated Multiple Regressions to Explain Level of Gold Imports in India

Period	Functional form	$\bar{R}^2$	Coefficient for GDPR	HHFS	IOSP	MARG

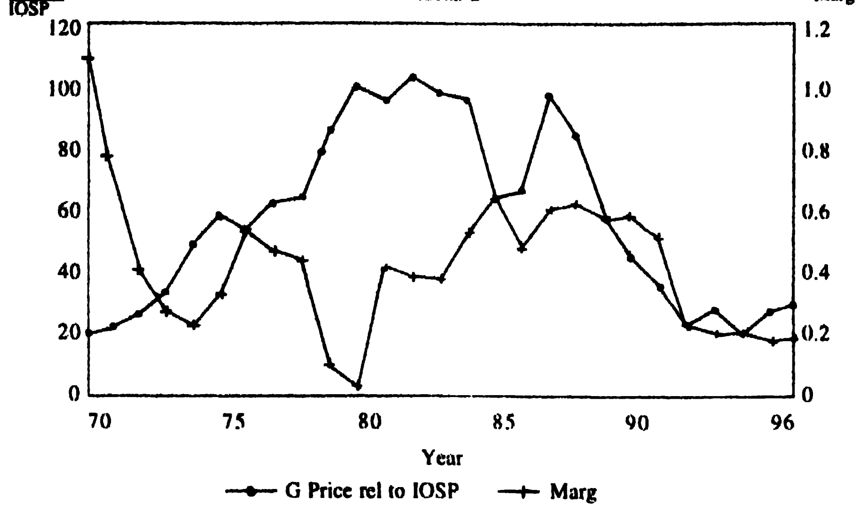
Figure 2



ments. This aspect, however is difficult to quantify.

Financial assets are highly heterogeneous; and their composition as well as market values are variable over time. It is therefore difficult to get a weighted index of returns to financial assets as a whole. Sarma et al computed the rate of return on representative financial assets but the basis is not spelt out. Moreover this specification does not take into account the level of market prices of the asset. For these reasons the present analysis uses the market prices of ordinary shares (reflecting rate of return as well as extent of protection against inflation) as a proxy for the return to financial assets.

Fourth, Sarma et al's estimating equations include domestic gold price, the wholesale price index, and "rate of return on representative financial assets" among the explanatory variables. The impact of gold being a function of gold price relative to 'substitutes', it would seem more appropriate to specify price variables in the estimating equation as prices of gold relative to the general price level and to the ordinary share prices.

Fifth from the supply side view point, the quantum of gold imported would depend (as Sarma et al rightly argue) on the extent to which domestic price exceeds the price in the world gold market and, under a regime of fixed rates, the difference between the open market rate of exchange and the official rate. The former (which reflects the impact of changes in domestic and foreign prices as well as exchange rate changes) indicates the potential margin of smuggler's profit on imported gold. The latter representing the extra cost he has to incur to get the needed exchange in the hawala market was an important factor till 1992 when exchange rates were left more or less free to be determined by the market and gold imports were legalised. Sarma et al's estimated equation for the period 1968-1990 includes the hawala rate, but yearwise data on these rates are not given.[3] After 1992, of course, the difference between the rate on the official foreign exchange market and the rate in the 'hawala market' has been greatly narrowed, though perhaps not entirely eliminated. We have therefore had to omit this variable in the present exercise.

The logic of including accretions to FCNR deposits and remittances to capture the supply of hawala exchange is rather dubious. In any case the open market exchange rate already reflects the net effect of both demand and supply of exchange in that market. There is no need to introduce a variable to capture supply of exchange in the hawala market.

In view of these considerations, gold imports viewed from the supply side is postulated to be a function essentially of the margin between domestic and international prices. And since observed gold imports simultaneously denote the quantum absorbed by, and the quantum supplied in, the market, it is not meaningful to estimate supply and demand functions separately. Therefore we use a reduced form combining elements affecting both side of the picture. Thus

gold imports =

$$f\left(GDPR,\ HHFS,\ \frac{GPRCE}{GDPDF},\ \frac{GPRICE}{IOSP},\ MARG\right)$$

Where

- GDP – total gross domestic product at constant price
- HHFS – ratio of household financial savings to gross national product
- GPRICE – Domestic price of gold
- GDPDF – Implicit GDP deflator
- IOSP – Index of ordinary share prices
- MARG – Difference between domestic and foreign price of gold as per cent of foreign price.

IV
Estimation and Results

The above relation has been estimated in its linear and loglinear forms on the basis of data for the period 1970 to 1996. These data their sources are set out in the Table 3. A clarification regarding gold import figures is in order. The figures up to 1990 are estimates of the Consolidated Gold Field and Gold Field Mineral Services reproduced in Sarma op cit (p 29). Thereafter the estimates are taken from the World Gold Council which is said to have started functioning in 1990. These are the best informed estimates of experts on the world gold trade. However it must be noted that the basis for these estimates and the comparability of the pre-1990 estimates and those for subsequent years could not be ascertained.[4].

Since the policy regime affecting gold imports changed radically in the 1990s, the above relation has been estimated separately for the period 1970 to 1990 as well as for 1970 to 1996. The number of observations available for the post-liberalisation phase is too small to permit a satisfactory testing of difference in the underlying relations before and after

Table 5: Estimated and Actual Gold Imports, and the Contribution of Significant Explanatory Factors in Recent Decades, India

(Tonnes)

Period	Predicted Values Based on Multiple Regressions* for Different Periods													
	Actual	Predicted Total	Mean Deviation (Per Cent)	1970-71 to 1996-97 Estimated Contribution of					Predicted Total	Mean Deviation (Per Cent)	1970-71 to 1990-91 Estimated Contribution of		
				Constant	GDPR	IOSP	MARG	HHFS			Constant	IOSP	MARG
1970-80	750	703	82.4	252	860	236	689	−1274	681	67.7	−283	132	965
1981-90	1021	1095	32.8	229	1239	675	711	−1758	1090	25.3	−377	377	1090
1991-96	2112	2066	17.8	137	1126	2046	206	−1449	1232	35.7	−226	1143	315
1970-96	3883	3864	49.6	618	3225	2957	1606	−4481	3003	45.5	−886	1652	2370

* the linear form. Mean deviation = mean of deviations between predicted and actual values during each period as per cent of actuals.

liberalisation. Instead comparison of the predicted values for 1991 to 1996 based on the regressions for the two periods with actual values is used to find out whether liberalisation made a significant difference.

The regressions were initially run using all the five explanatory variables included in specification in the equation on p 475. The coefficient for the ratio of the gold price index to the index of GDP deflator turned out to be statistically non-significant in practically all cases. This variable was therefore dropped and the regressions re-estimated. The coefficients for GDPR and also HHPS were non-significant in both the regressions for the period 1970-90; but significant in the linear regression for 1970-96. Therefore regressions for 1970-90 were re-estimated with only IOSP and MARG. All four variables were retained in regressions for 1979-96. The results (summarised in Table 4) indicate the following.

The bulk of the variations in gold imports (upwards of 75 per cent and in one case as much as 89 per cent) are accounted by the explanatory variables. The regression for the entire series (1970-96) explains a higher proportion of variance in gold imports during this period than the regression for the period prior to liberalisation.

The coefficients for GDPR and HHFS are not statistically significant during 1970-90. This implies that in this period gold imports were not influenced by the level of real output or household financial savings. They were therefore dropped and regression re-estimated using only IOSP and MARG. Both coefficients are strongly positive corroborating the expectation that higher the difference between domestic and foreign gold prices, and higher the ratio of gold to share prices, the larger will be the gold imports.

Estimates for the entire period show the coefficients for all four explanatory variables to be significant. The signs of the coefficients for GDPR, IOSP and MARG are positive as expected. But the negative coefficient for HHFS implies that higher financial saving by households goes with smaller gold imports. (The results are similar if we specify household financial savings to include gold acquisitions or use the total household saving rate instead of the financial savings rate.) This is against expectation

The positive and highly significant coefficient for IOSP and MARG establish convincingly that gold imports tend to be higher when domestic gold prices rise relative to those of (a) ordinary shares and (b) international gold price. The estimates further suggest that the effect of both these variables on gold imports was considerably less during 1970-90 than the period taken as a whole.

The fact that the value (and in some cases the significance) of the coefficients estimated from the two series are markedly different suggest that the underlying relations may have undergone substantial changes between 1970-90 and 1991-96. This is illustrated by comparing the closeness of the predicted values estimated from the linear regressions for the two periods to the actuals. The results are presented in Table 5.

They show that the mean percentage deviation between predicted and actual values of gold imports during the period 1970-96 is only slightly more when predictions are based on the regressions for the entire period compared to predictions based on regression using 1970 to 1990 data. However, the picture is very different when we consider different sub-periods. The percentage differences between predicted and actual values during 1970-80 and 1981-90 are considerably less when predictions are based on the 1970-90 series compared to those based on the 1970-96 series; the opposite being the case in respect of the 1990s.

Another way of looking at it is to compare the total of predicted and actual gold imports derived from regressions for the two periods. By this criterion, the predicted imports of gold during 1970-80 and 1980-90 are roughly the same in both cases. But during 1991-96, the prediction based on 1970-90 regressions are 40 per cent below the actual; while those based on the 1970-96 regressions are close to the actual.

The table futher shows that while variations in IOSP and MARG are major factors affecting gold imports in all cases, the influence of GDP and HHFS (which was weak during 1970-90) become significant when we consider the period as a whole. Another significant point emerging from both projections is the increasing importance of IOSP, and the decline in that of MARG, in accounting for the changes in gold imports. Thus the regressions based on 1970-96 show that IOSP accounted for 33 per cent of the predicted gold imports during the 1970s, 62 per cent in 1980s and nearly 100 per cent in the 1990s. The corresponding figures for MARG being 98 per cent, 65 per cent and 10 per cent respectively.

The relative roles of these two factors need closer study. The 1970s were marked by an increase in IOSP, and a decline in the margins. Though the former would have meant higher demand for gold, imports fell probably because the black market exchange rates were too high to make gold smuggling profitable. The 1980s witnessed a reversal with IOSP showing a falling trend even as MARG rose steeply (Figure 2). The margin of profit after allowing for cost of dollar in the hawala market might have been sufficient to attract gold imports. But during the 1990s both have been falling, with gold imports legalised, the principal determinant is the IOSP whose decline seems to be the principal stimulant for a steep rise in gold imports.

V
Conclusion

In sum, it is clear that the price of gold relative to share prices and international gold prices are important determinants of gold imports. IOSP is emerging as an increasingly important factor, even as the margin between domestic and foreign of gold has dwindled largely as a result of changes in exchange rate and gold import policies. So long exchange rate and gold imports are allowed to be determined by the market, IOSP seems likely to emerge as the crucial determinant of gold imports. However the results need to be confirmed by incorporating the hawala premium in the estimating equation. The role of aggregate income is not clearly established: it seems to be unimportant in the pre-liberalisation period, but emerges as significant when we consider the period as a whole. Whether, and how far this may be due to non-comparability of estimates for the pre-1990 and post-1990 period needs to be more closely examined. The strong large and unexpectedly negative impact of household financial savings on gold imports is difficult to explain. The nature of the underlying relations, and their specification in the estimating equation, deserve deeper probing.

Notes

1 There is room for further refinement in these estimates by (a) disaggregating total consumption by end use between exports ornaments, and gold held as bars, (b) more reliable estimates of scrap availability. Given the extreme sensitivity of the matter, it is difficult to get reliable direct data on these aspects. But efforts to disaggregate, even if roughly, by end use is important for analysis.

2 'Scrap' availability depends in part on the stock of ornaments. In the case of rural population gold stocks seems likely to be affected by fluctuations in output and terms of trade. But little is known about these aspects.

3 The omission of the hawala premium from the estimated relation would give biased estimates of the coefficients. This could be connected if the relevant data used by Sarma et al were available.

4 According to Sarma et al, op cit (p 10), as against the Gold Fields Mineral Services estimate of 170 tonnes of imports during 1989-1991 the World Gold Council estimated the 1990 imports at 240 tonnes. This suggests that the assumptions and basis of the two estimates differ. To this extent the series for 1991-97 is not strictly comparable to that for earlier years.

Politics of Culturalisms in an Age of Globalisation

Discrimination, Discontent and Dialogue

Rustom Bharucha

The intercultural, the multicultural and the global inhabit different yet overlapping narratives that should not be arbitrarily conflated. There is a crisis of practice in much philosophical and social scientist thinking on multiculturalism and an insufficient engagement of philosophers with emergent cultural practices. This article attempts to intersect political philosophy and cultural practice. While multiculturalism works within the cultural logic of multinational capital, interculturalism has the potential to work against this logic

INTERCULTURALISM has many unresolved contradictions, among them the globalising tendencies (and resistances to globalisation) embedded within intercultural practices, as well as the blurred areas in which the agendas of inter- and multiculturalism converge, if only to separate. In this article, I will be risking somewhat more theoretical reflections on the political and economic inequities of north-south cultural transactions. I will also attempt to expose some of the philosophical discontents of multiculturalism in its continental manifestations, which have very different frames of reference from the relatively unformulated state of multiculturalism in India today. It is my hope that by questioning the continental hegemony on culturalism from a subcontinental perspective that a reversal of priorities can ignite new readings of intercultural theory. In a spirit of critical inquiry, one also hopes that our search for cultural collaborations within and across national boundaries will be deepened through a renewed respect for the intercontextuality that underlies any process of exchange. It is the philosophy of cultural exchange that concerns me here rather than its undeniably restrictive moorings in the practice of intercultural theatre. I have elaborated on this practice in my critique of the eurocentric and orientalist premises underlying the uses and adaptations of non-western performance traditions in Euro-American intercultural practices [Bharucha 1993].[1]

Working through a network of discriminations, discontents, and the possibilities of dialogue, I have attempted to clarify in an argumentative mode that the intercultural, the multicultural, and the global inhabit different, yet overlapping narratives that should not be arbitrarily conflated. I am concerned with both the political dynamics of these phenomena and their implications in the actual making of specific cultural practices. While I will not be focusing on Indian cultural practices *per se*, as I have in my earlier writings, I will be theorising how the politics of my location in India unavoidably shapes, how I see the larger world of cultural interactions and its increasingly global imperatives. How we situate our inherited and emergent conceptions of culture within the larger map of the world; how we can resist the increasingly sophisticated appropriations of non-western resources through new technologies and treaties; how we read first world interpretations not merely of 'our' cultures but of migrant/immigrant cultures within 'their' frameworks of citizenship; how we can activise a critical and responsible exchange of cultures against the demands of marketing forces and the insularities of pseudo-swadeshi nationalists – these are some of the underlying conceptual drives of this article.

To begin, therefore, with the image that catalysed my thinking of interculturalism as the exchange of cultures across nations. I recall a performance of one of our very many 'folk' dance-theatre traditions in India called Chhau from the eastern state of Orissa, which I was seeing for the first time in Calcutta in 1977. Chhau, however, was merely the backdrop for another 'performance' that was going on simultaneously in front of the stage. This real-life improvisation was being enacted rather unconsciously by a group of interculturalists from the first world, who were totally absorbed in clicking their cameras throughout the Chhau dance. I remember seeing the backs of these interculturalists, and a very glittering array of cameras, zoom lenses, videos, and projectors, which at that point in time signified for me, at a very visceral level, an image of western technology and power: the power of capital. Today, when I look back on this image, I realise that my first exposure to interculturalism was already refracted insofar as I was seeing at least two things at the same time: the Chhau dance on a makeshift stage, cut by the bodies and technology of the interculturalists.

Among the many questions provoked by this image, which has become a visual trope in my intercultural imaginary, I remember asking myself: Who are these people? What are they seeing? And why are they so oblivious to the hundreds and thousands of people sitting behind them? These questions suggest a context of exclusion on my part, implying a relatively uninterrogated sense of cultural belongingness and territoriality that is being assumed, even as it is in the process of being disturbed.

In a more reflexive mode, therefore, I would turn the critical gaze on to myself: Was I overreacting to what I saw? Were we being made into voyeurs of our own culture as we saw Chhau through the screen of alien bodies? To what extent can Chhau be regarded exclusively as 'our' culture? What goes into the construction of this possessive adjective 'our' – our culture, our language, our nation? After all, one knows that the regional hegemony of 'Indian culture' ultimately succeeds in subsuming indigenous, folk, and tribal cultures within its ostensibly homogenised linguistic and cultural frames, even though the practitioners of these cultures can be marginalised and demeaned by upper-caste patriarchies in everyday life.

At a more global level, I would interrogate a different set of details: the photographs, images, and recordings that were taken during the performance. Where have they been circulated over the years? To whom have they been circulated? And with whose permission? Does access to technology ensure the rights of ownership, representation, and distribution? It is with these questions that I would like to focus now on some contentious issues relating to 'intellectual property rights' which have yet to be adequately addressed within the emergent debates on the globalisation of cultures in our times.

I
The Rights of Culture

Along with the growing policing of human rights by which first world nations legitimise their control of third world economies on humanitarian grounds, there is now, increasingly, a bombardment of threats around the alleged violation of intellectual property rights. Third world countries like India, for instance, are often accused of abusing these rights by multinational corporations and pharmaceutical companies, the consciences of the first world. But is it possible to reverse the charges, as indeed environmentalists [Shiva and Holla-Bhar 1996] have succeeded in doing, by exposing the hypocrisies of those industries that have presumed to patent indigenous plants like 'neem', which is used by millions of Indians as a toothbrush and for medicinal purposes? How do we counter similar instances of 'cultural piracy' that have yet to be acknowledged?

It is heartening in this regard to acknowledge the growing sensitivity among many western artists, theorists, lawyers, environmentalists, and anthropologists to the global transactions and appropriations of non-western cultural resources and practices. Increasingly, there is a critical consensus that intellectual property laws are 'selectively blind to the scientific and artistic contributions of many of the world's cultures'; ironically, when these cultures are recognised, they are denied the rights of authorship [quoted in Boyle 1996:193]. There is also an increasing cognisance of the imbalance between the 'traditional knowledge, folklore, genetic material and native medical knowledge' that are flowing *out* of third world countries 'unprotected by intellectual property', in contrast to the surfeit of works from developed countries that are flowing *in*, 'well protected by international intellectual property agreements, backed by the threat of trade sanctions' (ibid).

It could be argued that this increased vigilance around intellectual property violations is an exaggerated form of political correctness that plays more on the fears of cultural piracy rather than on empirical evidence. Critics of intellectual property could also be accused of speaking falsely on behalf of oppressed communities, who may not be aware of their exploitation and who could even be philosophically opposed to the idea of patenting their traditional wisdoms. These arguments, I would emphasise, are made in bad faith; they underestimate both the casual complicities of a wide range of professionals in acts of cultural piracy, as well as the increased alertness on the part of indigenous communities to the economic value of their traditional skills and resources.

Besides, in an age of globalisation, when the future in a sense is already in the process of being patented, a pre-emptive attitude to the exploitative potential of intellectual property cannot be sufficiently emphasised. Within the very real risks posed by the tradable intellectual properties (TRIPs) that have now been sanctioned within the General Agreement on Tariffs and Trade (GATT), it is possible to speculate with some conviction that 'transnational cultural corporations may obtain all rights to exploit for profit any piece of music, any image, any text they believe to have commercial potential. The consequence will be that those corporations may become the exclusive owners of substantial pieces of artistic cultures wherever in the world and thereby influence, perhaps even determine, the direction in which those cultures may develop' [Smiers 1997:3].

While it could be argued that these fears apply more readily to highly marketable cultural products, artefacts, and skills relating to the mass media, graphics design, and the fine arts, it would be disingenuous to exempt less commercially viable activities like the performing arts from the control of the global market. Even if non-western theatrical productions and performances as such are not likely to interest the transnational corporate sector, the raw materials, techniques, and resources from non-western countries can easily be transported, channelised, and converted into 'original' products (performance pieces, video demonstrations, research programmes), which can then become eminently marketable through the funding available to festivals, universities, and a select body of avant-garde work.

The question that needs to be addressed is unavoidably polemical: What do the home countries and communities, from where these resources emanated, receive for their contribution to the creative process? Are they even acknowledged? The difficulties posed by these questions are invariably elided within the hype of global cultural enterprise, which for all its transcendence of specific national and cultural boundaries, remains doggedly loyal to the most conservative assumptions of what constitutes a work of art in the first place. If this 'art' belongs to anyone, it is indisputably the 'property' of an inspired 'author'. ('Genius' is the word that is still used to describe the most celebrated of global cultural impresarios.)

In this regard, the cult of the author has rightly been exposed by critics of intellectual property like James Boyle (1996), who traces the tenacious hold of an 18th century romantic notion of authorship on the most blatant distortions of environmental loot. 'The romantic author', as Boyle points out, 'was defined not by the mastery of a prior set of rules, but instead by the transformation of genre, the revision of form' (1996:54). Ultimately, it is this stamp of originality and invention that is upheld in claims around intellectual property rights, at the expense of taking into account collaborative and communitarian modes of production, inherited legacies of oral and folk wisdom. In this context, the cultural resources of indigenous peoples and tribal communities are particularly vulnerable to misuse because they are not owned by any defined party; they belong to the entire community. Unfortunately, 'individual' ownership is more accountable at legal levels than 'community' belonging and sharing, just as 'innovation' is more assessable than 'tradition', 'transformation' more precise in the specificity of its altered form than the vagaries of 'evolution' [Frow 1996:98].

Within the framework of these biases, the double standards of the upholders of intellectual property rights become only too evident, as the border lines between 'ideas' and 'expressions', 'inventions' and 'discoveries' are proving to be more blurred than globalists are prepared to acknowledge [ibid:93]. Admittedly, these blurrings are harder to specify within cultural practices than in the more scientific terrain of gene technology, for instance, where 'seed as seed' and 'seed as grain' are discriminated for commercial purposes, the 'use-value' of the seed being supplanted by the 'exchange-value' of the grain [Kloppenburg 1988:3]. In contrast, artistic endeavours are not so easily discriminated; if a contemporary visual artist, for instance, incorporates the skills of an indigenous craftsman into his/her art work, there is no obligation as such to acknowledge this contribution.[2] The skill of the indigenous craftsman is, at best, a facilitating agency for which payment is due. Recognition, however, goes to the artist who has the 'idea' in the first place to use the skill of the craftsman in order to realise a particular 'expression.' Likewise, there are many number of complexities in determining the authorship of collaborative and interdisciplinary works of art like installations, which can be further complicated through new tech-

niques of quotation, *bricolage*, and remixing.[3]

One could argue that these new modes of authorship have evolved in response to the availability of new technologies in the metropolis, but they should not be valorised at the expense of acknowledging communitarian systems of knowledge in which authorship is often anonymous. The ultimate perversity in exploiting this anonymity lies in the ruthless appropriation of the principle of 'universality', whereby the 'common heritage of mankind' which is embodied and celebrated in so many holistic disciplines, rituals, and ceremonies, can with a few strategic adjustments, become the 'properties' of particular individuals and agencies. How, in such demeaning and exploitative circumstances, can the 'cultural commons' of indigenous cultures be democratically recognised and shared in the 'public domain' without being ripped off by the speculators of the culture industry?

There is a loaded political context in such questions relating to different cultural practices and art forms, which has yet to be adequately extrapolated from the more rigorous readings of bioimperialism and biodiversity in environmental agendas. In contrast, the concern for the ecology of cultures would seem to be, at this point in time, more rhetorical than real. Even in the most scrupulously liberal of cultural exchanges, ostensibly tuned to the demands of political correctness, there can be any number of blind spots and slippages in the ethics of cross-cultural representation and borrowing. When does the 'fair use' of resources from other cultures, even in the least commercial of endeavours like academic research in the non-western performing arts, for instance, become an alibi for the production of a new expertise at the expense of acknowledging local knowledge? What are the perks of this expertise that remain unaccounted for through the promotion of individual careers and the empowerment of new categories of cultural representation? If we have not begun to answer these questions, it is because they are in the process of being articulated from the oblivion of their assumed privilege: the privilege of silence that academics have within the apolitical aura of their seemingly unadulterated search for knowledge.

II
The Intercultural and the Global

Shifting the discussion away from the globalisation of intellectual property rights, one needs to discriminate between those intercultural endeavours that are in the process of being globalised (if they are not already globalised), and those which work against the grain of dominant global narratives. This is not an easy discrimination to sustain, but let me attempt some clarifications on the subject. Not every cultural exchange, I would acknowledge, needs to subscribe to the global agenda determined by the market economy, the satellite media culture, the McDonaldisation of commodities, among other phenomena of global capitalism. There are artists in the world who seek each other out at personal and creative levels, through the harshest of economic circumstances, with no particular hope of recognition even within the framework of their respective national cultures. The work of these relatively unknown artists is not likely to be commodified by the agencies of corporate culture. On the other hand, there can be established artists whose narratives can work against the demands of the market that they are in a position to negotiate. Still others can opt out of the market altogether, pursuing a different set of cultural interventions that bring together a wide spectrum of activists, drop-outs and dissidents, representing the non-conformist, if not subversive, elements of any society.

Interculturalism, I would affirm, embraces all these possibilities of dissent, and therefore, it is ironic that its most ardent advocates should so naively equate the 'intercultural' and the 'global' – terms which are often used synonymously, and even harmoniously, particularly in first world cultural contexts, where globalisation is not just taken for granted but actively promoted. In India, however, there is a tremendous resistance at ground levels to the homogenising, commoditising, and anti-democratic tendencies of globalisation, as exemplified in people's movements directed against mega enterprises like the Sardar Sarovar Dam Project in Narmada or Cogentrix in Dakshina Kannada. The resistance to globalisation has also extended more arbitrarily to its cultural ancillaries, which would include corporate media spectacles like the Miss World Beauty Pageant in Bangalore, which was attacked by sections of feminists, on the grounds that the commodification of beauty is inseparable from the consumerist propaganda of the global market. In this opposition, they received the unprecedented support of the farmer's movement as well, which had earlier opposed the introduction of Kentucky Fried Chicken into the Indian market. It is worth keeping in mind that while KFC is a thoroughly domesticated global icon in developed societies, so much so that it would be regarded as 'indigenous', if not disparagingly associated with the kind of junk food that the poorer sections of society eat, this very KFC becomes a status symbol in countries like India. In other words, the cultural signs of this commodity are totally different in third world economies, thereby challenging one of the most illusory norms of globalisation that it is capable of levelling differences across borders.

Without exposing the economic hegemony of globalisation, it becomes disingenuous to accept its 'emancipatory results' in the cultural sphere. As posited tentatively by Geeta Kapur, these 'results' can be related to the 'freedom' from 'the national/collective/communitarian straitjacket', along with the 'paternalistic patronage system of the state' and the rigidities of 'anti-imperialism' [Kapur 1997:30]. There is no reason to my mind why artists should be inhibited from exploring 'other discourses of opposition' relating to gender and minority issues, which Kapur associates with yet another liberatory aspect of global culture. I would contend that the right to criticise the official agendas of the state is eminently possible within the seeming constraints of a national imagery, along with new articulations of cultural representation relating to women dalits, tribal communities, and other minorities. The 'emancipatory results' by which Kapur attempts to inflect her critique of globalisation are illusions of freedom; they are the phantoms of the market which reduce possibilities of dissent to a pastiche of their co-optation.

I am more in agreement with Kapu when she claims the privilege as a residen in the third world to resist globalisatio within the framework of a contestec national culture – a privilege that may no be available, as she correctly points out to our colleagues from more globalisec economies. This privilege, I believe, need: to be extended to the practice of inter culturalism, in order to subvert its affili ations to global capitalism from within it more established ranks. In other words, a opposition to globalisation cannot b restricted to the national boundaries o third world contexts, even if such a opposition would appear to make mor sense in such contexts than in first worl locations, where globalisation has bee normalised both in the financial and cul tural sectors. To oppose globalisation i one political context, and to conform t its agenda in another, is the surest way c subscribing to cultural schizophrenia.

The interculturalist, I would like t believe, is not a schizoid opportunist wh shifts his/her position out of convenienc

Nor is the interculturalist a free-floating signifier oscillating in a seemingly permanent state of liminality and in-betweenness. The interculturalist is more of an infiltrator in specific domains of cultural capital, which could exist in first and third world contexts as well. The ubiquity of global capitalism compels the interculturalist to negotiate different systems of power in order to sustain the exchange of cultures at democratic and equitable levels.

III
The Intercultural and the National

To shift the timeframe of this essay back to 1977, when I first saw the Chhau performance that provoked me into thinking about interculturalism, I should acknowledge that I was not thinking about globalisation at that time. The new economic policies of the Indian government had not yet been articulated. Nor could one have predicted the imminence of the satellite media invasion, for the simple reason that television had yet to enter our homes. In 1977, I found myself implicated within an increasingly uncomfortable awareness of what Frantz Fanon has described so memorably as 'the pitfalls of national consciousness' Within the transposition of these 'pitfalls' in the Indian context, where the process of decolonisation continues to elude us at so many levels, one was a witness to the post-Emergency euphoria of a nation attempting to re-establish its authenticity, through a retrieval of a pre-Nehruvian past.

At an idealised political level (which, unfortunately, failed to materialise in a sustained secular political alternative to the Congress Party), there was an advocacy of decentralisation through an upsurge of alternative activist initiatives, at times inspired by the panchayati raj of people's democracy. In the more institutionalised sectors of cultural practice as well, there was a more vacuous retrieval of the past through an 'invention of tradition', whereby a 'back to the roots' anti-modern/anti-realist/anti-western policy was crudely, yet tenaciously propagated by the state and its accomplices [Bharucha 1993:205-08]. These proponents of an authentic 'Indianness' were neither nativist visionaries nor ideologues for the most part, but cultural bureaucrats who exemplified the 'intellectual laziness' that marks the defunct state of the national bourgeoisie: 'Not engaged in production, nor building, nor labour...the innermost vocation of [the national bourgeoisie] seems to be to keep in the running and to be part of the racket' [Fanon 1967:120]. It was in this nationalist framework of 'being part of the racket' that my first exposure to interculturalism needs to be contextualised.

I remember thinking to myself at that time: if the interculturalists at the Chhau performance were there, it is because they had been invited to be there. They were not intruders, but the honoured guests of the local impresarios of the organisation and state cultural officials, who sought some kind of foreign endorsement for their display of indigenous culture at home. Such endorsements in the intercultural scenario are invariably made possible through a series of complicities not just at economic, political, and professional levels, but more acutely, through the ideological bases and biases of different cultural institutions and modes of expertise across systems of power that would like to believe in the autonomy of their interactions. This autonomy is, perhaps, most emphatically asserted in the seeming transcendence of intercultural practice over all national boundaries and considerations. Indeed, if there is one premise that would bring together the widest spectrum of Euro-American interculturalists, it would be a rejection, if not denial of their own national identities and affiliations.

In the world of intercultural theatre, for instance, there is much evidence to support the resistance to nationalism in the 'transcultural' search for a universal theatre language across cultures in the work of Peter Brook and his 'ultracultural' quest for the origins of theatre in the spectacle of *Orghast*.[4] Different variations of this anti-national resistance can also be traced in the paratheatrical experiments of Jerzy Grotowski and his Theatre of the Sources, as well as the theatre anthropology of Eugenio Barba, which privileges the 'pre-expressivity' of cultures that underlies their acculturation in specific contexts. These seeming discriminations between the 'transcultural', the 'ultracultural', the 'pre cultural' [Pavis 1996:6-7] share a common ground in their distance from, if not resistance to, the realities of history, political struggle, and above all, nationalism. There is no point in reiterating here my intense discomfort with the apolitical/asocial and universalist premises underlying these established examples of Euro-American intercultural theatre practice [Bharucha 1993:13-87]. Rather, what concerns me is where I stand in relation to the 'national', a category which was not theorised sufficiently in my earlier critiques of interculturalism.

As suggested somewhat euphorically in liberal manifestos of interculturalism [Schechner 1982], 'The world...is in the process of moving from its nationalistic phase to its cultural phase, and it is preferable to distinguish cultural areas rather than nations' [quoted in Pavis 1996:5]. Not only is this statement a profound wish-fulfilment that is not actually substantiated by the events in the *realpolitik*, where we have witnessed since 1989 an upsurge of nationalism, secessionism, insurgency, and fascism in almost all parts of the world, it is debatable whether 'nationalistic' and 'cultural' phases can be separated quite so easily in any discussion of culture, particularly in post-colonial contexts. One obvious paradox that liberal supporters of interculturalism fail to confront is that in countering one nationalism, other nationalisms are invariably in the making. But perhaps, a more politically engaged reading of culture would indicate, as Frantz Fanon has emphasised, that 'national consciousness' could be 'the most elaborate form of culture' itself [Fanon 1967:199].

There is an obvious provocation in this statement that challenges not just the anathema to nationalism represented by interculturalists, but by a wider range of post-colonial theorists, who have contributed to the 'disparaging of nationalist discourses of resistance' [Parry 1987], which have been marked as 'coercive, totalising, elitist, authoritarian, essentialist and reactionary' [Lazarus 1993:70-71]. The nationalist underpinnings of my own critique of interculturalism have not spared me from being described as 'demagogic' and even 'ridiculous' [Pavis 1992:179]. Turning to Fanon for ideological support, therefore, one is aware that though the historical moment of the Algerian struggle for independence cannot be replicated in the Indian context, the contradictions of that moment and the foresight with which Fanon was able to anticipate the degeneration of nationalism in post-independence societies, are among the most chastening reminders in my cultural context of how history can repeat itself in disturbingly familiar ways. I turn, therefore, to Fanon not for answers, but to find a ground in which the 'national' can be re-positioned against nativist celebrations of community, communal affirmations of a monolithic nationalism, and the glib advocacy of post-nationalism. This re-positioning of the 'national' cannot be separated in the Indian context from the emergent cultures of struggle in search of a more participatory people's democracy.

Fanon's provocation lies precisely in not clarifying the enigmas that he sets forth in his militant, yet contradictory –

I will not say equivocal – statements. For example:

> National consciousness, which is not nationalism, is the only thing that will give us an international dimension...It is at the heart of national consciousness that international consciousness lives and grows. And this twofold emerging is ultimately the source of all culture [Fanon 1967:199].

Neil Lazarus probably comes as close as we are likely to in identifying 'national consciousness' as 'a liberationist, anti-imperialist, nationalist internationalism' [Lazarus 1993:72], which has been named 'nationalitarian' by Anwar Abdel-Malek in order to discriminate its agenda from the more negative associations of 'nationalism.' Fanon himself emphasises more than once that nationalism – the 'magnificent song' which fuels the struggle for independence – has a great capacity to degenerate into 'ultra-nationalism', 'chauvinism', and eventually 'racism' [ibid:125].

This degeneration is part of a narrative that most post-colonial/intercultural thinkers would endorse because it plays into the demonisation of what is assumed to be an intrinsically tainted phenomenon. Thus, we find in Fanon's critique of nationalism, the familiar charges of the tyranny associated with blaming other communities for the predicament of the post-independence nation. This process of othering minorities, which would be described as 'communalism' in the Indian political context today, invariably thrives on the resuscitation of 'old tribal attitudes', 'spiritual [inter-religious] rivalries', 'drivelling paternalism', and 'regionalism': 'African unity takes off the mask, and crumbles into regionalism inside the hollow shell of nationality itself' [ibid:128]. Fuelling this degeneration of nationalism into a 'racism of contempt' is the steady decline of 'the party' (ostensibly the party that provided the leadership in the independence struggle, for example, the Congress Party in India). The bankruptcy of such parties is not spared by Fanon in the choicest of epithets: 'trade union of individual interests', 'skeleton of its former self', 'a means of private advancement', 'accomplice of the merchant bourgeoisie', 'a screen between the masses and the leaders' [ibid:136-37].

Clearly, there is no ambivalence in this critique of the party, which represents the most hollow manifestation of nationalism itself. But – Fanon does not stop here. In countering a degenerate nationalism, he does not posit any utopian post-nationalism, nor does he lapse into pre-modern communitarianism, or into a nativist valorisation of the authentic past. 'A national culture', as he emphasises, 'is not a folklore, nor an abstract populism that believes it can discover the people's true nature' [ibid:188]. On the contrary, Fanon returns to an intensification of national struggle at ground levels with somewhat different priorities: "If you really wish your country to avoid regression, or at best halts and uncertainties, a rapid step must be taken from national consciousness to political and social consciousness...[I]f nationalism is not enriched and deepened by a very rapid transformation into a consciousness of social and political needs, in other word into humanism, it leads up a blind alley" [ibid:163-65].[5]

Not only is it necessary to "break down the equivalences between 'national' and 'nationalism' ", as Stuart Hall has suggested in his own inflected reading of Fanon [Hall 1996:42], one also needs to work against moribund notions of an 'empty international humanism' (ibid) and seek out a new critical internationalism, which would include a profound respect for intercultural exchange through the mediation of different histories in post-colonial struggles. There is a lot of work that lies ahead in actualising these discriminations within cultural practices, but perhaps, one can begin by addressing the nullity of those prejudices that equate the 'national' with the regimentation of nation states, the policing of borders, and the construction of 'good citizens'. This demonisation of the 'national' can only homogenise nationalisms, apart from undermining the very real struggles and sacrifices that have gone into the activisation of social and political movements in different parts of the world.

On a more personal note, I would suggest to the neo-liberal, anti-nationalist seekers of interculturalism from first world cultural contexts that they should first begin to account for their own implicit nationalisms, and their very real privileges which are so often taken for granted in their ownership of passports from first world nations – the ultimate sign of global privilege – which enables them to travel to almost any part of the world without difficulty. This is not a privilege that many of us from third world countries can assume. As I have often emphasised in my critical interventions, in international fora, our interculturalism begins with the trauma of having to obtain a visa on our much maligned, if not degraded passports, in order to travel not merely to 'the west', but to almost any country in Asia or Africa. I confront the injustices of competing and disparate nationalisms every time I am invited to an intercultural forum. For all my 'expertise' as a seasoned traveller, I am marked along with my fellow-citizens as a potential illegal immigrant, if not a terrorist, so much so that my negotiation to cross the border in face-to-face encounters with visa officers has now become a performative act in its own right. It is not surprising, therefore, that my closest compatriots in intercultural performance should be border artists, who unlike their liberal counterparts who assume the crossing of borders as their birthright, never to take the border for granted.[6]

IV
The Intercultural and the Multicultural

Intercultural decision-makers would like to believe that they function with a certain map of the world that counters the official maps and borders. But one finds that even on these seemingly altruistic, humanitarian, border-free/border-less maps, the routes of cultural exchange have already been charted, the zones of interaction have already been fixed. And some zones may not exist at all, which means that one could be reduced to an absence. If one wanted to shift these zones – break the dichotomies of the north and south, east and west – or if one desired to re-route the map – bring the cultures of the south closer together – the possibilities of doing so are extremely remote in the absence of alternative routes, structures of representation, and infrastructures of support. Indeed, the 'crossroads' of cultural exchange are often substituted by the 'inroads' of institutionalised interculturalism, whereby the south-south cultural exchange is unavoidably mediated by the north.[7] While it could be argued that these mediations are not necessarily undemocratic, I would acknowledge that they are extremely constraining because they work against the basic premises of voluntarism on which interculturalism is based as a theory and practice.

Voluntarism as a critical principle is unavoidably linked to the larger framework of liberalism that assumes a freedom of choice, which may not, in reality, exist for all its assumed beneficiaries. At an ideational level, however, it is a useful term insofar as it enables us to discriminate interculturalism from the larger, more emphatic, if not overdetermined narratives of multiculturalism, which have been hegemonised by the state. While the governments of western democracies like Britain, Canada, and Australia have for-

mulated official policies of multiculturalism, none of them can presume to have an intercultural policy: the 'inter' will invariably lie outside of the direct control of the state. Unlike the 'multi', which is concerned with the cohabitation of different cultural and ethnic groups negotiating an ostensibly common framework of citizenship, intercultural practitioners have a greater flexibility in exploring – and subverting – different modes of citizenship across different national contexts, through subjectivities that are less mediated by the agencies of the state.

Unlike interculturalism, which has yet to be cogently theorised – it is at once too scattered in its multiple locations and modes of expression to be subsumed under any one theoretical framework – multiculturalism has been over-theorised in western contexts through a surfeit of conflicting narratives that suffer from an overkill of ideology. This is in distinct contrast to the relatively untheorised state of multiculturalism in India, which continues to draw implicitly on the diversities of 'Indian culture' sanctified by the statist mantra of 'unity in diversity'. While there may seem to be some advantage in not having an official multicultural policy – a cynical view could be that it is this very absence of policy that enables us to speak about so many cultural diversities in the first place – one cannot ignore the deeply entrenched injustices and differences underlying the 'politics of diversity' upheld by the Indian state, which need to be linked to specific histories of social disparity and religious patriarchy. Only by disrupting the primordialities of unchanging diversities, which merely legitimise fixed notions of 'community', as Kumkum Sangari has argued so forcefully, can we develop a more democratic cognisance of and respect for cultural differences.

It could also be argued that a 'defence of multiculturalist politics' [Vanaik 1998] in the Indian context may not be adequate to confront the advocacy of 'one nation, one language, one culture' by the forces of hindutva, whose onslaught has extended not merely to debates around the university curriculum and affirmative action (as in western contexts of multiculturalism), but to the systematic undermining of the secular and democratic foundations of the Indian state. Nothing less than a 'holistic project of opposition' [ibid:642] is needed to confront the fiercely monocultural and racist premises of hindutva. I would regard the mobilisation of multiculturalism in India across caste and communitarian differences as one element in the shaping of this 'holistic' project. Certainly, our multiculturalism in India will have to develop on significantly different lines from the emergent (and perhaps, flawed) models in western societies, but there are lessons to be learned from the very differences and failures of multicultural policies and cultural practices in the west. It is in this context of 'learning through difference' that the commentary that follows on different readings of multiculturalism in western democratic societies can be most meaningfully translated (or rejected) in the Indian context.

The most significant point of departure that would need to be acknowledged is that 'multiculturalism' might never have entered the western vocabulary had it not been for the realities of immigration. In Britain, for instance, the politics of multiculturalism is inextricably linked to the influx of labour from the ex-colonial countries in the late 1950s; its process of making immigrants into compliant citizens has been engineered by the most established agencies of the state and civil society monitoring the systems of law, education, employment, language, and social welfare. Significantly, it was the propagation of a liberal 'integrationist' mode of multiculturalism in Britain from the mid-1970s onwards (in opposition to the 'nationalist' assimilationist policies of immigration upheld earlier) that precipitated a crisis that still continues.

Many activist writers on the Left in Britain have reflected forcefully on how the state propagation of multiculturalism has resulted in a breakdown of a consensus built around a 'black' political identity and class solidarity that had unified a wide spectrum of Asian and Afro-Carribean workers against the discriminatory practices of the state. Within the rhetoric of respecting cultural differences, the liberalisation of multicultural policies has merely succeeded in 'depoliticising race and substituting (a narrowly defined) 'culture' for anti-racist consciousness' [Mohanty 1998:17]. Furthermore, at a grass roots level of community organisation, 'the government funding of self-help groups undermined the self-reliance, the self-created social and economic base of these groups; they were no longer responsive to or responsible for the people they served – and service itself became a profitable concern' [Sivanandan 1985:6]. In the name of freeing communities from the 'objectivist delusion' and 'essentialist nostalgia' of race, to use Satya Mohanty's ironic categories, multiculturalism divided communities – against each other, within themselves. It became another mode of promoting sectarianism, thereby perpetuating the policy of 'divide and rule' in former colonies, but camouflaged within the multicultural aura of respecting a plurality of cultural identities and ethnicities.

Satya Mohanty has argued that this reading of multiculturalism has echoes in other political contexts as well – for instance, in the US, where as Michael Omi and Howard Winant (1986) have pointed out, 'an objective analysis of racist domination was obscured by an intellectual [postmodern/post-colonial] agenda that emphasised the cultural multiplicity of 'ethnic' identities' [quoted in Mohanty 1998:18]. Whether or not one subscribes to the socialist register and reassertion of 'race' as a political category in these readings of multiculturalism, one cannot deny that the multicultural narrative is beginning to implode from within the unresolved tensions of its inner contradictions, even within neo-liberal endorsements of its framework.

V
Perspectives on Multiculturalism

Having acknowledged these discontents, however, one is also obliged to defend more historically inflected readings of multiculturalism against the recent backlash of conservative opinion that would like to reduce its agenda to a caricature of affirmative action for essentially undeserving minorities. It is out of this compulsion that I would like to focus now on a spectrum of radical, liberal, and communitarian perspectives on Euro-American multiculturalism. This is not intended to be a comprehensive or even a selective overview, but rather a series of schematic positions (and provocations) on multiculturalism that I would like to interrogate both at the levels of political theory and cultural practice. At a methodological level, I will be intersecting different languages that are rarely brought into collision because they incorporate radically different grammars, vocabularies, and epistemologies of thought. In this collision of languages, there is the risk of a certain awkwardness, but perhaps this is unavoidable in any attempt to heighten the intercontextuality of a layered and polyphonic phenomenon like multiculturalism. In addition, I will be interrupting the political agenda of multiculturalism with some emergent lessons drawn from intercultural practices. Having prepared the reader, I hope sufficiently, for my 'theoretical incorrectness', I invite you to engage critically in the disjunctions of this discourse.

I begin with Slavoj Zizek's incomparably subversive reading of multiculturalism as much for its capacity to exhume the spectres of earlier liberationist modes of thinking, as for its lethal demolition of contemporary myths of coexistence:

> [M]ulticulturalism is a disavowed, inverted, self-referential form of racism, a 'racism with a distance' – it respects the Other's identity, conceiving the Other as a self-enclosed 'authentic' community towards which he, the multiculturalist, maintains a distance rendered possible by his privileged universal position...[T]he multiculturalist respect for the Other's specificity is the very form of asserting one's own superiority [Zizek 1997:44].

In this exposure of multiculturalism, there are some immediate provocations of the universalist assumptions underlying intercultural practices, which tend to be critiqued (if at all) within the context of ethnocentricity rather than racism. Unlike the multiculturalist who, in Zizek's formulation, 'distances' himself from the Other through a privileged universality, the interculturalist, at least in his/her most idealised manifestations, erases all distinctions through an assumption of a shared universality. In the empty space of the intercultural meeting ground, which assumes the 'point zero' of an authentic 'first contact' between 'essential human beings', there is a total erasure of the participants' ethnicities in favour of their universal human identities, creativities, and potentialities. The interculturalist is above ethnicity; s/he is always already human. And therefore, s/he can afford to propose a universality for all, cast in an invariably white, patriarchal, heterosexist image.

This naive acceptance of an innately human 'universality' in intercultural practices is quite different in its implications from the kind of 'moral' and 'radical' universalism that is affirmed by cultural theorists like Satya Mohanty, whose reading of 'universality' is opposed in its own right to Zizek's more shifty and strategic use of the term. In Mohanty's anti-foundationalist, 'realist' defence of multiculturalism, a 'minimal rationality' is posited as the base for any inter/multicultural communication: "No matter how different cultural Others are, they are never so different that they are... incapable of acting purposefully, or evaluating their actions in the light of their ideas and previous experiences, and of being 'rational' in this minimal way" [Mohanty 1998:198]. It is this inherent capacity for critical and collective reflexivity that defines 'human agency', thereby providing the 'universal' foundations for all kinds of progressive movements in the cultural and political sectors. While Mohanty's 'objectivist' rebuttal of the 'relativist' readings of cultural pluralism works refreshingly against the grain of post-modern theoretical fashion, it also risks seeming reductive, if not formulaic, in its axiomatic endorsement of an unproblematised 'rationality'.

In contrast, Zizek's endorsement of 'the true Universality to come' is almost excessively inflected in its opposition to the 'neutral universality' of existing systems and the 'anti-universality' of Rightist groups steeped in their own particularistic agendas [Zizek 1997:50]. The Left, as Zizek presents the problem of universality, has no other option but to confront the 'paradox' of its allegiance to an ideal of 'universal emancipation', along with its acceptance of 'the antagonistic character of society' (ibid). In other words, it is only by accepting 'the radically antagonistic – that is, *political* – character of social life' that one can be 'effectively ***universal***' (ibid, emphases in original). This is quite different in effect from assuming, as Mohanty does, that the 'universal' (of 'minimal rationality') already exists, thereby precipitating the possibilities of radical action.

Working on the premise that 'antagonism is inherent to universality itself', Zizek splits the unitary concept of universality into 'the 'false' concrete universality' of existing systems of knowledge, and 'the impossible/real demand of 'abstract' universality' (ibid, emphases in original). It would seem that the 'true Universality to come' cannot be posited within what already exists in the name of the universal, by which systems like multiculturalism legitimise their racist practice. However – and this is the point of a closer rapprochement between Zizek's and Mohanty's seemingly incommensurable positions – the 'assertion of the universality of antagonism' (which coexists with the 'antagonism inherent to universality itself') does not foreclose the possibilities of a dialogue with one's antagonists. Without spelling out how this is actually implemented, Zizek believes that culture can continue to serve as an 'efficient answer to the gun', and that its struggle is embodied in and through *reflective knowledge* [ibid:51, emphasis in original).

At this very fundamental level of the human capacity to discriminate and reflect on its choices it would seem that there is a meeting, though not necessarily a fusion, between two different readings of 'universality' as offered by Mohanty and Zizek. But – the routes by which these cultural strangers on the Left arrive at the critical inflection of 'reflective knowledge' in 'our' world, are fundamentally different. While Mohanty would seem to retrieve a notion of the 'universal' from earlier political struggles, which he then attempts to catalyse in the creation of 'the shared epistemic and social space' of multicultural discourse and practice, Zizek introjects the 'universality to come' into his subversion of the existing multicultural frames that have been hegemonised by the state and the global order. While multiculturalism for Mohanty continues to offer the possibilities of a 'democratic project' within a moral and realist framework of values, Zizek is more sceptical of 'morality' in his 'ethical suspension of the law', by which he consciously thrusts the narrative of multiculturalism into 'the cultural logic of multinational capitalism', which is coterminous with the upsurge of ethnic cleansings and other forms of fascism in our world. If Mohanty is still capable of seeing 'the world' as the common site of inter/multicultural endeavours, Zizek's vision is far less unmediated, as he chooses to see the world not through a glass darkly, but through a consciously distorted lens, not unlike the upturned eyelids of a contemporary Butoh dancer surveying the relics of a post-Hiroshima present.

Through the interplay of these collisive readings on universality, it becomes more viable to accept that while the human desire for creative interaction can serve as the minimal 'universal' base for intercultural encounters, this desire is fraught with tensions, compulsions, hidden agendas, and funding realities, as I have indicated earlier in the context of the existing inequities of intercultural exchange. Let us accept that there is no 'pure' universal base for intercultural practice in any art form, and that the 'universal minimum' that can be said to initiate any intercultural exchange is extremely fragile, based more on intuition, desire, and good faith than on any real cognisance of the other. It is only through the process of exchanging differences, not only through specific cultural languages but the contexts supporting them, that another, more reflexive realisation of 'universality' can be produced and shared through creative consensus and dialogue. There is no reason to believe, however, that this evolved 'universality' will remain intact; indeed, in the field of theatre, for instance, the phenomenology of per-

formance (and its inherent condition of 'dying' within the concretisation of its practice), would resist the illusion of any permanent state of universality, which is always in the process of being made, unmade, and remade. Ironically, the artists who flaunt their 'universal' credentials are invariably the most insular practitioners of their art.

Through Zizek, it also becomes possible to unread the somewhat naive assumption that the interculturalist's universality is a kind of mask that disguises his/her 'real' ethnocentricity. Perhaps, it is this ethnocentricity that is the 'phantasmatic screen' in Zizek's words, which 'conceals the fact that the subject is already thoroughly 'rootless', that his true position is the void of universality' [Zizek 1997:44]. However, there is a less startling reversal as well that may need to be addressed here, insofar as the 'void of universality' can be filled with a thoroughly 'rooted' eurocentricity, if not racism, that does not attempt to screen its arrogance. Racism does not always work with screens; it can be most respectably enunciated through the most cultivated opinions.

EUROCENTRICITY, RACISM, MULTICULTURALISM

At this point, it would be expedient to inflect the relationships between eurocentricity, racism, and multiculturalism. While Zizek has no difficulty in describing multiculturalism as racism, the film theorists Ella Shohat and Robert Stam would not merely oppose such an equation, they would even insist that eurocentrism and racism are in no way 'equatable', even though they may be 'historically intertwined' [Shohat and Stam 1994:4]. Regarding Eurocentrism as an 'implicit positioning rather than a conscious political stance' (ibid), Shohat and Stam would stress that it is possible to be anti-racist and eurocentric at the same time. While this is undeniably true, the possibility that racism can be nurtured in and through eurocentrist values should not be summarily denied. Unfortunately, this is precisely the elision that underlies Stam and Shohat's otherwise persuasive reading of 'critical and polycentric multiculturalism' that is related at 'reciprocal' and 'dialogic' levels to a critique of eurocentricity. This critique results in what I would describe as a wish-list of multicultural virtues – 'no pseudo-equality of viewpoints', 'no established hierarchy

of cultures', 'no essentialist concept of identities', even an acknowledgement of the 'pain, anger, resentment' that inevitably surface in the meeting of historically differentiated and colliding cultures [ibid:48,358].

Despite their disclaimers that a radical multiculturalism cannot be 'nice' or 'politically correct', Shohat and Stam's prescriptions of multiculturalism succumb to these very traps in their overly modulated master text that ultimately rises above all controversies, even as it claims the right to represent them. In a consciously non-subalternist mode of representation – 'Can the non-subaltern speak?' is their plaintive reversal of Gayatri Spivak's radical question – Shohat and Stam's discourse on 'unthinking eurocentrism' is, perhaps, unthinkingly exclusivist in its refusal to submit the liberal premises of their text to subalternist scrutiny. An emphatic tolerance pervades their reading of intolerance, so much so that while racism is acknowledged at implicit and xenophobic levels in other writers, it has no place within their ontologies of either eurocentrism or multiculturalism.

This erasure of racism in multicultural agendas is particularly problematic in those contexts where the blurred relationships between eurocentricity and racism need to be highlighted. Consider, for example, the following notorious statement allegedly made by the American novelist Saul Bellow "When the Zulus produce a Tolstoy, we will read him [the Zulu Tolstoy]". The explicit cultural superiority of this statement can be read as racist not least by the Zulus themselves, who continue to be metaphorised as the nadir of primitivism, which totally denies them their historicity and dignity of being. As Charles Taylor, one of the most reflective interlocutors in the debate around multiculturalism, has pointed out:

(1) The Zulus have to produce a Tolstoy in order to prove themselves [Taylor 1994:71]. Nothing within their own cultural heritage can serve as an appropriate point of reference. The standards of excellence have already been determined in Europe, and the Zulus have to live up to them.

(2) The Zulus have yet to produce a Tolstoy ('When the Zulus...'). This indicates some kind of feigned familiarity with the existing oeuvre of Zulu literature, with which Bellow might be quite unfamiliar. In this regard, he would not be essentially different from our very own Salman Rushdie (and here I am consciously shifting the context in order to emphasise that cultural superiority is not the prerogative of European authors alone). In response to 'fifty years of independence', Rushdie has had the audacity to affirm a pantheon of Indian literature in a volume of select writings [Rushdie and West 1997] that has the dubious distinction of excluding all contemporary Indian writers writing in Indian languages, apart from English – languages which Rushdie might not have read, even in translation. This 'privileged voice of the diaspora', to appropriate a phrase used by Geeta Kapur in another context, is legitimised not through the invocation of a legacy (as in Bellow's invocation of Tolstoy), but through the sanction of the market and the liberal endorsement of the *New Yorker*.

(3) Back to the Zulus and Tolstoy, I would add a third reservation: Perhaps, the Zulus are not interested in producing a Tolstoy. He would, in all probability, bore them to death. Not reading Tolstoy could be a 'cultural choice' that should not be denied to them. Rejecting Tolstoy, however, without having read him, could pose a liberal dilemma.

(4) Taylor, however, adds a more provocative complication into the argument: "The possibility that the Zulus, while having the same potential for culture formation as anyone else, might nevertheless have come up with a culture that is less valuable than others is ruled out from the start. Even to entertain this possibility is to deny human equality" [Taylor 1994:42]. In the articulation of this 'possibility', a critical dialogue on the contesting criteria of assessing and evaluating other cultures becomes imperative.

Contesting Criteria

Let us focus now on Taylor's demand for an adequate set of criteria in order to evaluate the relative worth of other cultures. To assume the equality of cultures without knowing anything about them, amounts, in his view, to another kind of patronisation While this reasoning is eminently sound, it can be read as another 'screen' (in Zizek's sense of the word) insofar as it barely conceals a vehement rejection of those 'subjectivist, half-baked, neo-Nietzschean' positions [ibid:70], which assume that all judgments of worth are based on standards that are intrinsically hegemonistic and power-ridden.

At one level, it could be argued in Taylor's favour that while multicultural artists, for instance, have every right to question the standards of the decision-makers, who determine what is 'good' and 'bad' in multicultural practice (and consequently, what should be funded and what shouldn't), these artists cannot fetishise their condition to such an extent so as to believe: "Because we are so marginal, and no one understands us anyway, we alone have the right to determine our own standards and critical criteria". This attitude can easily lead to another kind of intolerance, if not self-mystification, which Taylor would castigate for its undermining of the human capacity to discriminate and to make reasoned choices.

On the other hand, to argue against Taylor's position, one could say that it is so entrenched within the rigour of a continental philosophical system (Rousseau, Herder, Hegel) that it theorises multiculturalism from above without taking into account the humiliation and rejection of a wide spectrum of immigrant communities, who may have no other option but to create their own 'neo-Nietzschean' criteria for their own self-respect, if not survival. At no point in Taylor's scrupulously argued theory is there an awareness of how the spectre of 'worth' can hegemonise the norms of 'quality' in essentially monocultural contexts. Not only is this elusive 'quality' denied *ipso facto* to multicultural artists, for instance, without of course being defined in any coherent way, it is also protected within privileged frameworks to which immigrant and foreign cultural workers are denied access. The outsiders who dare to cross the threshold of 'quality' could be rejected for being:

(a) too different ('Your work is interesting but we don't know where you're coming from. Of course, we wouldn't want to misrepresent you, therefore...').

(b) not different enough ('Your work is not sufficiently authentic. We're looking for something typically Indian').

(c) just like us ('Why is your work so modern?').

In Taylor's defence, of course, one should emphasise that he is not dealing with cultural practice as such but with the criteria by which other cultures need to be perceived and evaluated. Nonetheless, there are many valuable philosophical insights to be imbibed from the subversive ways in which multicultural artists have dealt with the strictures of 'ethnic insiderism', by which 'black artists are never allowed to be ordinary but have to visibly embody a prescribed difference' [Mercer 1997:37]. The problem is that even within Taylor's philosophical framework of multiculturalist politics, there is no space for subversion. Immigrant communities deserve 'our' respect, but the fact that they could disrespect the frames in

which their differences are being accommodated is not confronted as a viable choice. Drawing on Hans-Georg Gadamer's 'fusion of horizons', Taylor would seem to circumvent, if not postpone the actual struggle of interacting with cultural differences. Besides, do we need a 'fusion' in order to meet through differences? Surely an intersection or collision or ellipsis of horizons is more likely to resist the risks of cultural homogenisation.

Moreover, while critical criteria are necessary for the exchange of cultures on an inter/multicultural basis, one needs to acknowledge that they could be indeterminate, if not fuzzy in their contours and orientations. Indeed, as Susan Wolf has argued perceptively in a related context, indeterminacy could be one of the primary constituents of a pluralist sensibility which works against the premises of absolutism, relativism, and subjectivism [Wolf 1992:786-90]. While an absolutist position assumes that there is only one right answer overruling the relativist claim that 'what is right for you is different from what is right for me' [ibid:789], a subjectivist position, on the other hand, would claim that 'anything goes' [ibid:790], countering the more reflexive pluralist position which acknowledges that 'if there is no right answer...this does not imply that there are no wrong answers' (ibid). The seeming equivocality of the pluralist position does not mean that it is without commitment; nor does it fear the finality of answers. However, it is aware that in certain inter/multicultural contexts, the 'question of what is right...lacks a unique and determinate answer' [ibid:789].

While it could be argued that Wolf's comments relate primarily to the search for pluralism in ethics, it does not come as a surprise that she should find Taylor's preoccupation with 'worth' in the multicultural context to be an 'oddly disturbing' prioritisation over the larger issue of justice [Wolf 1994:78, 85]. While she shares Taylor's rejection of the subjectivist position that would insist on affirming the equality of all cultural contributions 'prior to inspection and appreciation' – such subjectivism merely results in 'contempt for the very practice of justification' and the possibility of 'authentic respect' [ibid:78] – Wolf is more resistant to the fundamental continuum that Taylor seems to uphold in assessing the worth of cultures and developing a politics of recognition and respect that is due to them. Wolf would argue that one needs to respect other cultures regardless of their 'relative worth' or whether they have anything 'particularly important to teach the world', or even at a more pragmatic level, if an acquaintance with them is likely to 'pay off' in terms of a more 'enlarged understanding of the world and a heightened sense of beauty' [ibid:81, 85]. One respects other cultures, and more specifically, peoples from other cultures because they are part of 'our community' [ibid:81]. To pretend that our 'foreign' neighbours and colleagues are 'just like us', or that they are worthy of respect only after we have studied their cultures adequately on a comparative basis, can only play into the existing prejudices of the 'Saul Bellows' of this world, who would prefer to retain their liberal aura of omniscient tolerance in the absence of a 'conscientious recognition of cultural diversity' [ibid:85].

VI
Philosophy and Practice

There is much for intercultural workers – and decision-makers, in particular – to learn from these philosophical investigations, particularly when the task of negotiating different cultural frames (as opposed to a singular one) poses additional challenges of perceiving, and indeed of preparing the ground to interact with other cultures. We may need to develop in this regard a respect for imperfection in our shaping and viewing of inter/multicultural collaborations, which should not be equated with a valorisation of half-knowledge that so often passes as 'expertise' by the *afficionados* of 'other' cultures.[8] Without engaging sufficiently with the difficulties involved in perceiving inter/multicultural practices – from whose eyes, and from which perspective do we observe the 'inter'? on what frames of reference can we draw to encompass the 'multi'? through which criteria? whose criteria? – it becomes somewhat premature to settle for a 'fusion of horizons' as Taylor does, instead of exploring the actual cultural dynamics of indeterminacy in a democratisation of cultural differences.

At this juncture, one is compelled to acknowledge the crisis of practice in much philosophical and social scientist thinking on multiculturalism, and more specifically, the insufficient engagement of philosophers with emergent cultural practices. On the one hand, earlier methodologies and disciplines of conceptualising 'culture' (including its practices) are incorporated within larger social and political theories of multiculturalism, but they are proving to be inadequate to deal with the influx of new social forces and circumstances that have resulted in unprecedented interactions with cultural strangers ('aliens') in the public sphere. While it may not be the responsibility of political philosophers to figure out how new cultural languages can be created – and perhaps there is a certain theoretical rigour in not intersecting political philosophy and cultural practice as I am attempting to do in this essay – the point is that without a cognisance of these new cultural languages there can be no real breakthroughs in conceptualising the matrices and paradigms of multicultural theory.[9] Thus, we find Charles Taylor acknowledging the necessity of being 'open to comparative cultural study of the kind that must displace our [*sic*] horizons in the resulting fusions' [Taylor 1994:73]. As he puts it, 'To approach a raga with the presumptions of value implicit in the well-tempered clavier would be forever to miss the point' [ibid:67]. But perhaps, it is Taylor who is missing the point in restricting multiculturalism to an evaluation of what already exists (and tellingly, in the uncontested realm of 'high culture'), instead of figuring out the 'multicultures' in the making through popular and mass mediations (to which immigrant communities have greater access).

In this context, while one can agree in principle with Taylor that human identities are created dialogically through an encounter with 'significant others' (George Herbert Mead), one is nonetheless compelled to recognise the existing cultures of 'insignificant others'. Why does the narrative of multiculturalism need to perpetuate a post-enlightenment notion of 'enrichment' through the 'significance' derived from the 'rich human languages' of other cultures? Besides, multiculturalism is enriched not through accretion and absorption alone, but through a dismantling of predetermined legacies and genealogies. In order to gain something, we may have to give something up. Taylor does not begin to grasp the pertinence of this axiom, which assumes, in my view, the multicultural necessity of betraying

one's culture of origins. This betrayal is not merely the burden of the immigrant who is displaced from his or her homeland: those who assume a citizenship that is being granted to others need to re-think their own norms. The challenge is not merely, as Taylor puts it, 'to deal with their sense of marginalisation without compromising our basic political principles' [ibid:63]. Taylor, I would suggest, needs to accept the dialogic possibility of his marginalisation as well. Why should minorities always be 'othered' for the enrichment of their assumed benefactors?

If Taylor suffers from an excess of caution, which almost legitimises the absence of an exploratory, potentially messy relationship with other cultures, most inter/multicultural artists whom I have encountered, would seem to function with an excess of desire for the Other. Clearly, their preoccupation is not with the worth of other cultures, but with the mystique of their difference ('I'd love to work with the Zulus' would be their enthusiastic response) And yet, it is worth pointing out that the desire for the Other in actual practice need not always be reciprocated for very strong social, historical, and political reasons. This resistance to an assumed reciprocity in cultural exchanges needs to be inscribed in our search for collaborations.

Keeping this in mind, I would emphasise the euphoria underlying the neo-liberal pursuit of 'cultures of choice' [Schechner 1996:49] from within the comforts of a metropolis, where cultures can be readily consumed along with their cuisines. It would be necessary to question whether these cultures want to be consumed in the first place. Secondly, one needs to resist the fatuous belief that ethnicities are so fluid that they can be 'bartered' and 'swapped'; they can 'hybridise' and enter into all kinds of 'promiscuous' relationships (ibid). The individuals who can afford to barter and swap their ethnicities have obviously no difficulty in affirming their multiple selves. But if one considers the predicament of underprivileged communities like the dalits in India, for instance, whose ethnicities have been stamped on, demeaned, and inferiorised for centuries, surely the task of upholding a dalit identity is part of a long and hard struggle, which has involved a disidentification from earlier, hallowed, patronising descriptions of untouchables as 'harijans'. In this struggle, where identity is politicised in a consciously affirmative mode, a dalit cultural worker or activist is not likely to let go of his or her ethnicity because this could be the only lever for self-respect through social and political mobilisation.

At this point, the counter-argument could be that interculturalism is not dealing with the dalits of this world, the wretched of the earth. Who then are the appropriate candidates for intercultural exchange? Are we – and I include myself here – part of an exclusive club of frequent flyers, the privileged diaspora, the global intelligentsia, the enlightened exiles? If that, indeed, is the case, could we then account for our exclusions? Or can we perhaps extend the privilege of interculturalism not merely to 'one of us', but to non-metropolitan community workers and activists as well, who have as much right as we do to crossing borders? This extension of privilege, however, is only possible through an implosion of its values by its most self-confident beneficiaries. A crisis of faith is needed – yet another betrayal, if not infiltration of global capitalism from within its cultural enclaves – before the resources that make interculturalism possible can be redistributed at more subversive, yet democratic levels.[10]

While multiculturalism works within the 'cultural logic of multinational capitalism' [Zizek 1997], I would like to believe – and perhaps this is the utopic thrust in my own discourse – that interculturalism has the potential to work against this logic. But for this to happen, its practitioners will have to dispense with many proliferating myths of globalisation, namely, its invincibility, inevitability, non-negotiability, accompanied by the hoax of a liberalised world economy that has emerged through the apparent dissolution of national sovereignties and borders. Along with 'the myth of the powerless state' [Weiss 1997], we need to undermine the bogey of the essentially demonic, anachronistic state that has been reinforced through recent theories of post-nationalism, which have attempted to displace conventional (yet tenacious) notions of place, community, and belonging in favour of emergent identities in 'diasporic public spheres' [Appadurai 1997].

Emergent cultural identities, as I have emphasised elsewhere [Bharucha 1998], are not the prerogatives of the diaspora alone. Indeed, they are very much in the making along with new subject-formations within the fractious and contradictory processes of people's movements in India, wherein the 'national' is in the process of being re-articulated against the hegemony of the nation-state and its global affiliations. Within this democratisation of 'political society', as Partha Chatterjee (1997) has conceptualised the process, it becomes imperative for artists and cultural workers to realign their own increasingly atomised constituencies to cultures of struggle, wherever they may exist in the world. It is within these contexts of struggle that the most critical debates on intellectual property rights and the destruction of the ecological bases of world cultures can be meaningfully contextualised and shared across different locations. It is also around these struggles that intercultural dialogue can deepen beyond an exchange of techniques and resources to a recognition of the increased poverty and unemployment of artists almost anywhere in the world; the increased apathy of governments to the arts (which seems to be increasing in direct proportion to the rhetoric of multiculturalism); and finally, the glib (and violent) displacement of the human in favour of what can be commodified, marketed, and patented. It is out of a recognition of these realities that we can restore our faith in what Slavoj Zizek describes as 'the true universality to come', which should not be assumed to exist in our existing inequitous practices, but which needs to be worked on, struggled for, and strategised through a more sustainable, reflexive, and dialogic intercultural praxis.

Notes

[Shorter and somewhat different versions of this article have been presented at the conference on 'Frameworks for Art' organised by the Mohile Parikh Centre for the Visual Arts in Mumbai, February 1998, and at the First Dom Tower Lecture organised by Passepartout in Utrecht, October 1997. I am particularly grateful to Joost Smiers for sharing his research on 'intellectual property' with a spirit of generosity that makes intercultural exchange both possible and meaningful.]

1 It should be noted that the word 'interculturalism' began to be used in the early 1970s by theorists of 'intercultural theatre' like Richard Schechner, who acknowledges that he used the word as "a contrast to 'internationalism' " [Schechner 1996:42]. Associating the 'international' with 'official exchanges and artificial kinds of boundaries', Schechner posited a different kind of 'exchange among cultures, something which could be done by individuals or by non-official groupings, and which doesn't obey national boundaries' (ibid). While there is undeniably a blurring of national and cultural boundaries, not just in post-colonial societies but in so-called developed countries as well, as Schechner correctly emphasises, the 'national' cannot be erased in any exchange of cultures, either across national boundaries (as in intercultural exchanges), or within national boundaries (as in multicultural or intracultural exchanges attempting to work across different communities, ethnic groups and regional constituencies). The erasure of the 'national', as I will discuss later in the

article, could be one of the most deceptive illusions of intercultural theory.

2 I am reminded in this context of an intercultural art workshop conducted at Sanskriti Sagar in New Delhi, where one of the foreign participants wanted to incorporate embroidery into his art work Unskilled in this specific art, he nonetheless drew a sketch of the image he had in mind: this image was taken by an intermediary to a group of local women artisans doing traditional embroidery for a living Without entering into any dialogue with these women, the artist had no difficulty in accepting their embroidery which he promptly framed, and then claimed as 'his' work of art (for which he obviously got a price when it was sold) Is this illegitimate art practice, or a legitimate rip-off?

3 Emergent debates around 'authorship' have extended both to the avant-garde and popular sectors of contemporary cultural practice in India For instance, in the 're-mixing' phenomenon of Hindi pop music, old hit songs from early Hindi movies are receiving electronically transformed renditions, with no acknowledgement whatsoever to their original sources [see Jha (1998) for a sharp journalistic account of these commercially legitimised modes of plagiarism]. Significantly, while the re-mixing maestro Bally Sagoo is obviously savvy enough to distinguish between a 'lift' and a 'cover version' of the same song, whether he is re-mixing Nusrat Fateh Ali Khan or the veteran Hindi film composer R D Burman, the idea of 'quotation' has yet to enter the vocabulary of pop music in India, following the more ironic and reflexive experiments in international pop

About the only self-conscious mode of quotation in contemporary Indian art practice is to be found in the relatively recent development of 'installations' Vivan Sundaram's Memorial (1993), for instance, draws heavily on an anonymous press photograph (by Hoshi Jal) of a victim in the Mumbai riots – an image that is defaced/framed/ concealed/ cut/erased in a variety of ways This installation provoked a debate on the need to acknowledge all the sources and credits in multi-media work notably photography as used in the 'art form' of the installation [see Satish Sharma's acerbic 'Still a fodder for the "finer" arts' (1993), for a critical perspective on the issue of acknowledgement] Similar debates have yet to emerge in discussing the 'classical' Indian performing arts, where the routine appropriations of 'folk', 'traditional' and tribal' resources are systematically legitimised, if not honoured under the pretence of 'reviving' traditions, or of 'innovating' new ones

4 It is necessary to point out that Brook's 'ultraculturalism' was made possible through the patronage of the Empress Farah and the Shah of Iran, the official benefactors of the Shiraz Festival in which *Orghast* (1970) had been prominently featured Such seeming oblivionsness to the cultural facade of a political dictatorship reveals the depths at which interculturalists can seek refuge in the platitude that 'art has nothing to do with politics'

5 There are two caveats that need to be included in the discussion here One would concern the possible tensions that could emerge in any developing society where 'social and political consciousness' supersedes, if not functions independently of 'national consciousness'. In this regard, Fanon disturbs any complacency relating to the genealogy of consciousness. While affirming the necessity for a rapid transformation of national consciousness into social and political consciousness, he also acknowledges "The African people and indeed all underdeveloped peoples, contrary to common belief, very quickly build up a social and political consciousness. What can be dangerous is when they reach the stage of social consciousness before the stage of nationalism" [ibid.164] The prescience of this observation relates provocatively to the Indian context of people's struggles, where with all the multiple oppositions to the Sardar Sarovar project in Narmada, the Cogentrix plant in Dakshina Kannada, the patenting of biodiversity, the numerous struggles of dalits, adivasis, ryots, there is still no adequate organising framework that brings these movements together through sustained interaction. Tellingly, through the valiant efforts being made in this direction by the National Alliance of People's Movements led by the environmentalist-activist Medha Patkar, one is alerted to the continuing resonance of the 'national' as providing the site for consolidating the larger struggle for people's democracy and social justice.

There is yet another caveat that needs to be included in the re-articulation of the 'national' I have in mind Homi Bhabha's somewhat disingenuous attempt to acknowledge that "the national in the Fanonian 'good' sense can be found in those kinds of minority fronts, which are articulating a transnational connection outside of the usual currency of national discourse" [Bhabha 1996:43]. This is yet another reiteration of what Benita Parry has justifiably criticised as Bhabha's penchant to 'annex' ideas of resistance that are decontextualised from specific histories of struggle. While I would not deny the transnational linkages of the environmental struggles in India with similar movements in the Amazon and elsewhere, I would foreground the specifically national context of these movements, which are not 'minority fronts' in some larger nebulous map of diasporic connections But people's movements intrinsic to the struggle for democracy in a post-independence/post-Ayodhya India.

6 'Border Art' refers to an interdisciplinary, multicultural movement of activist performances and installations initiated in 1984 by an eclectic group of American, Mexican, and Chicano writers and artists located in the neighbouring cities of San Diego and Tijuana Now afflicted by its own internecine clashes of conflicting egos and different readings of 'the border', this movement is nonetheless memorable for its audacious and transgressive representations of exile, migration, xenophobia, and racism. Some of its site-specific performances have literally been played across the border of different states

7 'Inroads' refers to an ambitious intercultural project funded by the Ford Foundation, where the basic premise is to open the possibilities of interdisciplinary, cross-cultural collaborative work with artists based in the US. As the unidirectionality of the word suggests, 'inroads' is restricted by its specific ordering of routes, and the implicit bias in favour of cultures from the south feeding the multicultural agenda of the north (in this case, specifically the US).

8 I was alerted to the intercultural dynamics of the 'respect for imperfection' in a presentation made by Adrian Piper in a conference on 'Frameworks for Art' at the Mohile Parikh Centre for the Visual Arts in Mumbai, February 1998 Piper began her presentation by acknowledging that she was opening herself

in an Indian forum to a great deal of risk, if not derision, by speaking on yoga, one of the disciplines that has inspired her own analytic philosophy and performance practice. Admittedly, Piper's 'imperfections' were real, not least her mispronunciations of basic Sanskrit words (which she herself constantly highlighted), apart from a very literal paraphrase of Patanjali. But this was just the prologue, if not preparation for her own philosophical journey into an exposure of racism and the politics of appearing to be 'white' when one is, in actuality, 'black'.

This transition from the philosophical context of yoga into the political realities of racism was a mind-blowing experience for the audience. What impressed and moved me deeply was not Piper's conceptual translations of the terms moksha and dharma within the junctures of her own autobiographical narrative, but the quality of stillness and concentrated energy in her presence. This, for me, was yoga in action. It was also an illumination of the subversive possibilities of yoga as a 'political' discipline. In retrospect, I would emphasise how much there is to learn from Piper's interculturality, where there is no attempt to demonstrate yoga as a set of skills which has become the norm in the fetishisation of oriental techniques by intercultural performance 'experts'. Piper demonstrates through her practice how the principles of one context can catalyse the formation of narratives in other contexts, without losing their inner resilience and vibrancy. To her colleagues in philosophy as well, Piper offers an altogether unprecedented provocation in her ability to concretise thought through performance.

9 In Bhikhu Parekh's reflections on 'being British' in the multicultural context of Britain today, there is an interesting focus on what constitutes 'the cultural language' of the nation. While this language is posited as an entity, it is also undergoing changes and incorporating a wide spectrum of 'different though mutually intelligible accents and idioms' [Parekh 1990:75]. 'Being British' is not about generalities like sharing '*values*' or a '*common view of British history*', still less about '*obeying laws*' and '*loving*' British society; it is specifically related to a 'conceptual competence' in being able 'to understand and handle the prevailing variety of accents' (ibid, emphases in original). Unfortunately, Parekh does not even begin to suggest how one goes about developing a cognisance of these 'pluralised' accents. Instead, he falls back on liberal urbanity by invoking 'a new spirit of partnership, a spirit of what the Romans called civic friendship' (ibid). This prelapsarian mode of utopianising the multiculturalism of our times is yet another implicit regression, reminiscent of Taylor's endorsement of a 'fusion of horizons'.

10 In economic terms, the privilege of interculturalism can only be deconstructed by those who control the capital that makes its practice possible. This involves much more than a liberalisation of existing funding policies, which continue to be based on moribund humanitarian and philanthropic premises that were formulated during the cold war to promote the privatisation of cultural capital. Today, a radical shift in the paradigms of funding is urgently needed, but this is not possible without an infiltration of new ideologies like the 'new abolitionist project' in white studies, which is based on the repudiation of the 'lie of whiteness' and the privileges attached to it [Winant 1997].

This 'new abolitionism' is considered by its proponents as 'the precondition for the establishment of substantive racial equality and social justice' [ibid:85]. Following the motto 'Treason to whiteness is loyalty to humanity', it exhorts whites to become 'race traitors' (ibid). While this position is not without its blind spots – not least, as Howard Winant points out, the inscription of 'non-white elements' within existing notions of whiteness – the 'new abolitionist project' is an appropriate challenge, in my view, to the tacit liberal support of prevailing racial and social injustices. Significantly, as the new funding policies around 'cultural diversity' programmes in the US indicate, there can be no meaningful mobilisation of cultural diversity without an acknowledgement of continuing racial discrimination. Finally, one is compelled to add that the implicit privileges of whiteness continue to underlie the very formulation of the funding policies themselves, which refuse to acknowledge their own racial underpinnings.

in Tamil Nadu than in Andhra Pradesh and in Kerala. The difference in the TFR between Andhra Pradesh and Tamil Nadu was nearly 0.7 births in 1971-73. There was a slow rate of decline in fertility both in Tamil Nadu and in Andhra Pradesh in the 1970s. However, the performance of Andhra Pradesh was superior to that of Tamil Nadu in the same period. This reduced the gap in the TFR between these two states to 0.4 births by 1979-81. Tamil Nadu has begun a course of rapid decline in fertility from the early 1980s. On the other hand, a stagnancy in the fertility rate is observed in Andhra Pradesh in the same period. This has again widened the gap in the TFR between these two states, roughly by one birth. The intensification of fertility decline in Andhra Pradesh started in the second half of the 1980s. Starting from the mid-1980s, the percentage decline in fertility has been sharper in Andhra Pradesh than in Tamil Nadu. On account of this, the expected number of births per woman has narrowed down to 0.6 by 1993-95. We must note, however, that Kerala recorded the higher rate of decline even in the 1970s.

An interesting aspect of fertility decline in Andhra Pradesh is the uniform rate of decline noted both in rural and urban areas. The decline in TFR between 1971-73 and 1993-95 was nearly 39 per cent in rural areas and 40 per cent in urban areas. The pace of decline in fertility in urban areas was higher in the 1970s and it widened the gap in TFR between rural and urban areas during 1974-76 to 1981-83. In all the other periods the difference in the number of children between rural and urban areas was less than one.

Fertility differentials are commonly observed not only with regard to the place of residence (rural or urban) but also for different sociocultural groups. Educational level, religion and caste group are the common variables with respect to which significant differences in fertility rate are noticed in India. The total fertility rate for groups classified by these selected characteristics is presented in Table 3.

Differential fertility is commonly noted for all the background characteristics in Andhra Pradesh. Across the different educational groups, the total fertility rate is lower among the literate with some educational background than among illiterate women. It may be noted in this context that around 69 per cent of the ever married women were illiterate in the state according to NFHS survey. Therefore, the considerable decline in fertility noted in the state would be the result of decline among the illiterate groups also, although the level of fertility among them is higher than among the literate group. The difference in fertility between Hindus and Muslims is narrow in the state. Christian, constituting 3.4 per cent of the eligible women in NFHS survey, however, record very low levels of fertility. The highest level of fertility is observed among the scheduled tribe population. Scheduled castes, on the contrary, records a TFR almost in line with the entire state. Nearly 5 per cent of the ever-married women in NFHS survey belonged to the scheduled tribe communities.

There is a strong correlation between total fertility rate noted from background characteristics and the percentage of family planning acceptors in the state. Illiterate women have substantially lower levels of acceptance rate than women with some educational level. The rate of acceptance is almost similar between Muslims and Hindus. Interestingly, the acceptance rate of family planning between scheduled castes and scheduled tribe population is also similar although the fertility rate among them varied substantially.

On the whole, it may be concluded that although the fertility rate differs with various characteristics, the level of fertility is low among all these groups, except scheduled tribes. Hence, perfect homogenisation in fertility is still to take place in the state. However, the interesting observation is that the fertility rate among the Muslims is in line with the state level and close to that of the Hindus.

Districtwise Fertility Decline

Andhra Pradesh is divided into three regions primarily based on historical factors. There are significant differences among the three regions, coastal Andhra, Telengana and Rayalaseema in the levels of socio-economic development. Andhra Pradesh was formed by amalgamating the Telugu-speaking areas of the Madras province under British India and the princely state of Hyderabad, which comprises the region of Telengana, one of the least developed regions at the time of independence. It is not that all the districts in one particular region are homogeneous in the levels of development. In the Andhra region of Madras province, there are less developed regions like Rayalaseema and north coastal Andhra compared to other coastal districts. Nonetheless, in most of the socio-economic characteristics, coastal Andhra fares better than the other two regions.

The estimates of district level total fertility rates are available from 1981 Census. However, the corresponding rates based on 1991 Census are not yet published. Bhat (1996) has undertaken an indirect estimation of district level TFR from the available information on the population of age below seven years from 1991 and 1981 Censuses. Hence district level estimates of TFR is available for 1974-80 and 1984-90 period. For the latest years, Balasubramanian and Satyasekhar (1998) have estimated TFR from the available couple protection rate at the district level. The different district level estimates along with female literacy rate and infant mortality rate (IMR) are presented in Table 4.

Table 4 clearly brings out the fact that the state is characterised by, possibly, one of the highest levels of regional heterogeneity among Indian states. The TFR estimates vary between 1.9 in West Godavari district and 3.4 in Adilabad district in 1995. Fertility rates are generally higher in the Telengana region. Moreover, the rate of decline in fertility in few districts in this region is also comparatively poor. Districts like Medak and Adilabad recorded higher levels of fertility and also a low rate of decline in the 1980s. Incidentally, Adilabad and Medak are two of the poorest districts in the state.

In a nutshell, all these data indicate that while there are significant variations in the

Table 2 Total Fertility Rate of Three Southern States and All-India
(Three year moving averages)

Years	AP	Ker	TN	All Ind
1971-73	4.5	4.0	3.8	5.1
1972-74	4.5	3.7	3.7	5.0

fertility rate among the regions in the state, a considerable amount of homogeneity is noted with regard to different sociocultural backgrounds. The difference in the fertility level for different sociocultural groups has been much lower than that noted among the regions. There has been a decline in all the districts, although the pace of decline is slow in a few districts in the Telengana region. In the coastal Andhra region, which is comparatively prosperous, fertility levels are lower. This is true even in the case of Srikakulam and Vizianagaram, the two poor districts in the case of north coastal Andhra. On the whole the poorest districts in Telengana region recorded a slower rate of decline and higher levels of fertility than in the other districts.

II
Factors Influencing Fertility Decline in Andhra Pradesh

The decline in fertility in any population, both historical and contemporary, has been attracting wide attention from researchers. Arguably, the decline in fertility is one of the important social and historical developments taking place.[2]

Studies on the European countries have clearly brought out the fact that fertility decline could take place under a wide variety of social, economic and demographic conditions [Coale and Watkins 1986]. The onset of fertility decline had occurred with infant mortality as high as 221 in Germany in 1890 and the percentage of literate as low as 40 per cent in Bulgaria in 1912 [Knodel and Walle 1979]. One of the crucial findings from the European fertility studies which has implications for developing countries is that decline in fertility can even occur in places with low levels of female literacy and high rates of infant mortality.

The discourse on fertility decline in India is mainly confined to two southern states in the country. The dramatic decline in fertility in Kerala in 1960s and more recently in Tamil Nadu has attracted the attention of scholars, both national and international. The experience of Kerala, on the whole, led to the understanding that even without significant improvement in the levels of industrialisation, urbanisation and material improvement in the standard of living of the people, fertility reduction could take place with social development.[3] Female literacy came out as one of the strongest variables explaining fertility decline in Kerala [Krishanan 1976; Bhat and Rajan 1990]. Along with female literacy, the health status of the people reflected in the low levels of infant mortality rate was also considered as a further possible explanation for fertility decline in the state in the above studies. Kerala's quick fertility decline has also led to several other explanations like those referring to socio-economic improvement [Zachariah 1984; Zachariah et al 1994], social justice in political and economic policies and development strategies reflected through land reforms and increased wages to agricultural labourers [Ratcliffe 1978], poverty induced factors [Mencher 1980;

Source: 1981 TFR are taken from Census of India (1981). 1974-80 and 1984-90 TFR are from Bhat (1996); and 1995 TFR from Balasubramanian and Satyasekhar (1998). Literacy rate is from Census of India (1991) and IMR estimated from 1991 Census by Rajan and Mohanachandran (1998).

Basu 1986] and so on. In general, however, female literacy and improved health facilities in the state are considered to be the most powerful among explanations.

The experience of Tamil Nadu, however, suggested that the decline in fertility could take place even with a much lower rate of female literacy and a higher rate of infant mortality than observed in Kerala. Although the female literacy rate in Tamil Nadu was much lower than Kerala, it was well above the national average. This comparison was true even in the case of infant mortality rate. A similar pattern was observed in some districts of Gujarat where the fertility rate has declined considerably even with lower level of female literacy than in Tamil Nadu and higher infant mortality rate [Visaria et al 1995]. All these confirm that it is nearly impossible to specify a threshold level of female literacy that would usher in a sharp decline in fertility [Visaria and Visaria 1994]. An analysis of the 1981 data by Krishnaji and Krishan (1994) showed that in the rural areas of Andhra Pradesh, female literacy, under five male mortality and ratio of male-female under five mortality did not have any relationship with children ever born or total marital fertility rate.

In the case of Tamil Nadu the explanatory factors varied from the implementation of vigorous family planning programme [Anthony 1992; Srinivasan 1995] to the success of backward class movements in the state [Anandhi 1996; Srinivasan et al 1991]. Further, Kishore (1994) argued that the exclusionary process – one that leaves the poor out – of development in the state is the leading cause of decline in fertility in Tamil Nadu.[4] Nagaraj (1997) attributed the fertility decline in Tamil Nadu to the phenomenon of 'social capillarity' where a large section of the population adopt family planning as a means for bridging the gap between increasing aspirations and expectations on the one hand, and the resources to meet these aspirations, on the other. The facilitators for the social capillarity phenomena are held to be: agrarian modernisation, strong rural-urban linkages, changing pattern of mobility, spread and reach of mass media and films, dilution of the progressive sociocultural content within the Dravidian movement in the state and so on.

The onset of the electronic era has also persuaded the researchers to emphasise the importance of the media. It is argued that while in Kerala the print media played a crucial role, in Tamil Nadu, and to some extent in Andhra Pradesh, the access to electronic media was crucial in explaining fertility decline [Bhat 1996]. A similar explanation has been offered from the experience of several developing countries; 'social interaction' has been suggested as one of the powerful forces that accelerate the pace of fertility change in a society [Bongaarts and Watkins 1996]. There can be different channels of social interaction such as spatial proximity to urban centres, extensive media facility and so on.

From the above studies[5] and also from the experience of Andhra Pradesh it may be concluded that it is difficult to prescribe a threshold level of female literacy for fertility transition. However, replacing female literacy with mass media, it is thought, does not reveal much about the mechanism of fertility decline particularly in the rural context. This is not to ignore the fact that the exposure to mass media has considerably gone up even in the rural areas. For example, the NFHS data revealed that among ever-married women in the age group of 13-49 years, nearly 26 per cent watch television and 56 per cent listen to radio once a week, while 41 per cent visit the cinema at least once in a month in rural areas of Andhra Pradesh. Only 32 per cent were not exposed to any mass media in the rural areas of the state. An anthropological study carried out in a panchayat at the East Godavari district also indicated frequent visits to cinema (nearly once in a week) by the poor agricultural labour families in the area [Saavala 1997]. However, the important question is: how is it that poor agricultural labourers in rural areas who are at the bottom of the economic ladder and presumably struggle to meet both ends, could afford to go to the cinema and spend time in watching television? Does this indirectly indicate that the standard of living of the people in the rural areas of the state has gone up at least to some extent so that they can now afford to have some leisure and enjoy life? Without going into the process of change as such, considering mass media as the sole explanation for the fertility decline is unlikely to be useful.

This section, therefore, attempts to bring out the likely forces in the dramatic fertility decline in Andhra Pradesh. The emphasis here is not to test each of the above hypotheses in the case of Andhra Pradesh. However, the first part will state briefly the importance of female literacy and health status in determining the fertility transition in the state. The changes that are occurring in the rural economy of the state are analysed in the second part. Thirdly, a statistical analysis is carried out to understand the factors responsible for fertility change in the state.

Importance of Female Literacy and Health Status

Table 4 clearly indicate that there is a poor correspondence between female literacy rate with total fertility rate among districts in Andhra Pradesh. In no district in the state except Hyderabad which is a fully urbanised district has the female literacy rate crossed 50 per cent. In nearly half the districts the female literacy rate is even below 30 per cent. Very low levels of literacy are recorded particularly in the Telengana region. The female literacy in two districts in this region is below 20 per cent. Even in north coastal districts like Srikakulam and Vizianagram where the fertility rate is comparatively low the female literacy rate is only slightly more than 20 per cent.

This is also true in the case of infant mortality rate (Table 4). The north coastal districts and the districts in the Telengana region generally recorded a higher infant mortality rate than other districts. Some of the districts in the Telengana region like Adilabad, Medak and Rangareddy which recorded highest rates of TFR do not have corresponding high levels of infant mortality rate. This again indicates that the fertility decline in the state is not in line with the decline in infant mortality rate.

Infant mortality rate, however, need not be the only indicator of the health status of the population. The probability of child survival will also depend on the proportion of children getting immunisation. This will, in fact, instill confidence among mothers about the child's survival chances. Further, this also indicates the availability of health facilities in the state. There are also other indicators like the antenatal care received by the pregnant women prior to delivery which would enhance the chances of survival of the child, particularly in the neonatal stages. Women who have received antenatal care would probably be more aware of family planning and the chances of their accepting family planning will also be higher.

The NFHS has collected information on antenatal care received by pregnant women in the four years prior to the survey. The information was collected from those women who had a live birth during the four years preceding the survey. The per cent distributions of live births during four years preceding the survey by source of antenatal care during pregnancy by background characteristics are given in Table 5.

An overwhelming percentage of mothers (86 per cent) have accepted antenatal

care and 62 per cent have received it from a medical doctor in Andhra Pradesh. This is, in fact, a remarkable achievement. Even in the rural areas the percentage of women accepting antenatal care is fairly high. Differences are observed in the acceptance of antenatal services based on the level of education. Interestingly, however, nearly 80 per cent of mothers even among the illiterate groups have received antenatal care. The highest percentage of non-utilisation of antenatal service is observed among the scheduled tribe population (35.5 per cent).

The percentage of children accepting all the vaccinations within 12 months is relatively low (36.5 per cent). However, the percentage of children not receiving any vaccination is also not very high (21 per cent). This implies that health facilities are available to most of the children in the state. However, many of them did not avail of the vaccination in time; nor have they undergone the full course of vaccinations. The availability of health facilities can instill confidence among the mothers on the survival chances of children.

The high incidence of antenatal care observed in the state definitely would have implications for the acceptance of the small family norm and family planning methods. More than half of the antenatal care even in the rural areas is provided by doctors outside home. In the hospital, women may be encountering a number of family planning acceptors and this would encourage them also to accept the same. Proper information on the method of family planning could also be obtained from health professionals during the antenatal check up time

In a nutshell, the role of female literacy and health status on fertility transition in Andhra Pradesh may not be as crucial as in the case of Kerala. However, significant changes are observed in the antenatal care of pregnant women in recent years. This would have played some role in the fertility decline in the state.

Role of Economic Factors

Although studies on fertility in India as a whole did not give much emphasis to the role of economic factors, it would be improper to ignore them altogether. Mainly two important changes are taking place in Andhra Pradesh, which have had an impact on the standard of living of the people. Firstly, there has been a considerable reduction in the population below the poverty line in the state over a period of time particularly in the 1980s. The second change, namely, the changes occurring in the labour market in the state, may be complementary to the first one. For the poor in the rural areas, the standard of living mainly depends upon the labour market conditions [Radhakrishana et al 1988].

The reduction in poverty in the state has been substantial over the last two decades and particularly from the 1980s.[6] The percentage of population below poverty line in Andhra Pradesh is the second lowest among major states in India after Punjab. This arguably has been attained not by a substantial increase in the per capita income of the people but through generous subsidies provided by the government in raising the standard of living of the people. Table 6 gives the population below poverty line in the state for different periods.

Rural poverty has declined dramatically and is now close to the Punjab figure of 11.95 per cent which is the lowest in India. The reduction in poverty in Andhra Pradesh has been attributed mainly to various poverty alleviation measures undertaken by the government. One of the important measures in tackling poverty has been the vigorous public distribution system (PDS) for foodgrains. The subsidised rice scheme at Rs 2 per kilo has been in existence in the state since 1983 [Indrakant 1996]. The price was increased to Rs 3.50 in August 1996. This scheme is covering nearly 70 per cent of the population in the state [Radhakrishana et al 1997]. In the rural areas, the coverage is as high as 80 per cent of the total population. Another programme which integrates supplementary nutrition with primary health care and informal education is the Integrated Child Development Services (ICDS). It tries to help the pre-school children and pregnant mothers with supplementary nutrition through a network of anganwadi.

Andhra Pradesh is also spending a substantial amount of money on several other poverty alleviation programmes. The data on money spent on PDS and ICDS and also on all the poverty alleviation programmes (PAP) are presented in Table 7.

Significant difference can be noted in the public spending on poverty alleviation programme between Andhra Pradesh and two other states. On a per capita basis, Andhra Pradesh spent almost double the money spent by Karnataka and Uttar Pradesh. The total money spent on food subsidy and ICDS are significantly higher in Andhra Pradesh. The state contribution in PAPs in the state is nearly 41 per cent, while it has been 21 per cent in Karnataka and 28 per cent in Uttar Pradesh.

All these indicate that the state was able to enhance the standard of living of the people by generous schemes. Studies conducted on the ICDS schemes report that the beneficiaries of the scheme in the state mainly belong to the economically

and socially weaker sections of the rural society like scheduled caste and scheduled tribe population [Radhakrishna et al 1997].

The standard of living of the people in rural areas is also determined by the employment opportunities and the wage rate. As a majority of the poor in the rural areas have only their labour power to sell, the number of days of employment and the wage rate ultimately determine their standard of living. Hence, the changes that are taking place in the labour market are crucial for the rural population. The nexus between poverty and unemployment was explicit in Andhra Pradesh, as shown by the data from the earlier rounds of the National Sample Survey Organisation (NSSO) [Parthasarathy and Jayashree 1995]. However, this relationship has weakened in the 1980s probably because of the public intervention programme in employment [Parthasarathy and Jayashree 1995]. The percentage of unemployed in the rural areas of the state for various years is presented in Table 8.

There is no doubt that there has been a significant reduction in the rural unemployment in the state particularly among females.[7] The female unemployment rate has declined consistently since 1972-73. The male rate has also come down to a low level by 1987-88, has registered a slight increase by 1993-94. However, this unemployment rate is higher than that recorded for all-India, although the rate is declining at a faster rate in the state than in all-India. It may be recalled in this context that the state also has one of the highest female work participation rates among the major states in India in 1991. The male participation rate is also high in the state.

Not only has the unemployment rate come down, but the wage rate of agricultural labourers has also shown a considerable increase in the 1980s.[8] The wage rate of agricultural labourers was Rs 5.9 and Rs 4.6 for males and females respectively in the state in 1980. This has gone up to Rs 23.9 Rs 17.8 for males and females by 1992. The real wage rate also indicated an increase from 0.9 to 1.4 among males and 0.6 to 1.1 among females between 1974-85 and 1987-88 at 1960-61 prices [Unni 1997]. However, Parthasarathy (1996) observed that during the 1990s the rising trend in real agricultural wages is not sustained. The wage rate of agricultural labourers varied considerably between the coastal districts and the dryland areas of Telengana districts in the first half of the 1980s. Thereafter, the gap has slowly narrowed to a considerable extent. The wage rate in coastal districts is Rs 25.6 and Rs 18.2 for male and females respectively while in Telengana it was Rs 23.5 and Rs 17.6 for males and females in 1992. This indicates a homogenisation of agricultural wages in these two regions.

Another interesting development in the labour market is the migration of labour to high growth areas and urban centres particularly in the 1980s. It is also argued that the living conditions of the rural labour households has gone up due to the remittances from these destinations [Krishnaiah 1997]. The homogenisation of the wage rate would also be the result of this migration of labourers.

All these suggest that substantial changes were occurring in the economic life of the rural people in the state in the 1980s. This would have been facilitated by several factors like the subsidised rice scheme for the poor, a large amount of money set apart for poverty alleviation programmes by the state, increasing rate of work participation, particularly of females and higher wage rates. All these developments could have increased the real income of the rural households.

The important question, nevertheless, would be how far the rising living standards have influenced the familial decision making especially on the choice of the number of children. Could these factors have generated an environment of livelihood security, so that the role of children as a source of income security become less important?

Statistical Analysis

Finally, to test the validity of some of the above arguments a logit analysis is carried out using household level data from the NFHS. The dependent variable selected for the logit analysis is ever use of any modern contraception. The analysis is also done for coastal Andhra and other regions (Telengana and Rayalaseema) separately.

Several independent variables are considered for the analysis. Age of the mother is included in the model as a squared term to account for any non-linear relationship between age and family planning acceptance. As family planning acceptance is also a function of number of male and female children ever born and dead, these are also entered into the equation. A square term is also introduced for all these variables. The number of children lost by the mother is the only health indicator in the model. Sociocultural variables like literacy of mother, literacy of father, caste and community are included as dummy variables. The effects of mass media are also sought to be captured by a dummy variable giving the exposure to any mass media, radio or television, in the past two weeks preceding the survey or visits to cinema in the past one month preceding the survey. Asset holding of the household would signify the economic standard of living of the household. Further, the work participation of women is included to know the effects of women's outside work on contraceptive use. Type of residence will show the impact of rural or urban residence on fertility. Table 9 gives the results of logit analysis on ever use of modern contraception in different regions of Andhra Pradesh.

The variables such as age, male children born and died, female children born and

died show a significant relationship with ever use of modern contraception. Surprisingly, neither literacy of mother or father show any significant relationship with family planning acceptance in the coastal Andhra region. Instead mass media exposure and asset holdings become two important variable that determine family planning acceptance in this region. Mass media, however, is insignificant in the case of Telengana-Rayalaseema region. In this region, work participation of women comes out as a strong variable that explains the use of contraception. Scheduled caste and scheduled tribe population seem to have lesser contraceptive use. Community (represented by the dummy 'Muslim') have significant impact on the contraceptive use only in the Telengana and Rayalaseema region.

On the whole, the logit carried out have indicated some very interesting patterns and also a certain inherent puzzle. Coastal Andhra region invariably shows that fertility decline is taking place even among the illiterate sections of the society. Whether mass media exposure is a substitute for literacy in this region is something which may need further probing. Another possible explanation for the fertility decline in the coastal Andhra may be in terms of the geographical diffusion which is observed in the entire coastal belt. However, without explaining how exactly diffusion has been taking place, citing it as a possible explanation for something which has already happened (the fertility decline), is not very useful.

In the Telengana-Rayalaseema region, on the other hand, mass media do not play any crucial role. In this region, variables like work participation of women in outside work have a strong correlation with both children ever born and family planning acceptance. The inherent paradox cannot be resolved easily. However, it is thought that the outside work of women not only provides additional income to the poor household but also exposes them, to some extent, to the outside world. Especially in a place like Telengana where the organisation of labour has a long and rich history of struggle and bringing about some changes, outside work of women possibly gives them better awareness than what mass media may provide. So work participation of women should not be taken as such but needs to be given emphasis in the context of a higher level of organisation of labour. James (1997) observed a similar experience in the case of agricultural labourers of Kerala. However, the reasons as to why work participation is not important in coastal Andhra region while being important in Telengana-Rayalaseema region in explaining the fertility variation needs further probing.

Conclusion

The southern states in India, on the whole, are undergoing a fertility transition. Of these Kerala and Tamil Nadu have already attained a replacement level fertility. The dramatic fertility decline in Andhra Pradesh shows that the state will follow the other two soon. This study has mainly attempted to depict the fertility decline in Andhra Pradesh and to bring out certain plausible explanations.

Fertility has been declining at a slow pace in Andhra Pradesh for at least two decades. However, a considerable decline in TFR is noted from the mid-1980s, after a stagnancy in the early 1980s. The neighbouring state Tamil Nadu, however, had a significant decline in fertility from the early 1980s onwards. The rate of decline as between Tamil Nadu and Andhra Pradesh was not widely different over the last two or three decades. However, the initial level of fertility in Tamil Nadu was much lower than in Andhra Pradesh and hence the magnitude of difference in total fertility rate still persists between these two states.

Another important aspect of fertility in Andhra Pradesh has been the similar pace of decline observed between rural and urban areas. The current fertility levels among different educational categories, religious groups and caste groups clearly indicate that fertility has substantially declined in all these groups. The difference in fertility between two prominent religious groups, Hindus and Muslims is negligible in the state. This is also observed in the case of family planning acceptance.

Spatial difference in fertility, however, still persist in the state, and the coastal districts and the Rayalaseema region have lower levels of fertility than the Telengana region. It may also be noted that the Telengana region, which was part of the old princely state of Hyderabad, was one of the least developed regions in the country. However, a fertility decline has occurred even in the Telengana region.

This study has also attempted to identify the factors responsible for the dramatic fertility decline in Andhra Pradesh. The discussion on the causes of fertility decline

TABLE 9: RESULTS OF LOGIT ANALYSIS ON EVER USE OF MODERN METHOD OF CONTRACEPTION IN DIFFERENT REGIONS OF ANDHRA PRADESH, 1992

Asset holding: Number of assets owned by the household out of the total number enquired in the list of durable in the NFHS.

in India are mainly confined to the experience of Kerala and Tamil Nadu. Based on the experience of Kerala, female literacy and health status of the people are considered as two influential variables in reducing fertility. However, the impact of female literacy appears to be rather weak in Andhra Pradesh. On the other hand, a significant progress is noted in the antenatal care of pregnant women.

The decline in fertility in Andhra Pradesh would have intensified due to the striking changes that are taking place in the rural economy, particularly in the 1980s. The state government introduced a vigorous public distribution for food by which nearly 80 per cent of the people in rural areas are given rice at a very cheap rate. There are also other schemes like ICDS, in which government was pumping sufficiently large amounts of money to enhance the standard of living of the people. With all these developments the population below poverty line has declined dramatically in the state since the 1980s.

Along with the poverty reduction, significant changes are also taking place in the labour market in the rural areas. The unemployment rate has come down substantially and the agricultural labour wage rate has gone up even in dryland regions like Telengana. Further, there is also large-scale migration of labour to urban centres and wetland regions where employment opportunities are higher.

All these changes, it is thought, would have helped to increase the standard of living of the rural people to some extent. However, whether the generous government intervention and increase in wage rate could create an environment of economic security whereby the role of children as economic security declined is a question which may need further probing. It is thought that some of these measures would have acted as a disincentive for having more children even in the rural context. To test the above argument a few regressions have been carried out at the district and the household level using NFHS data.

The household level analysis is carried out for coastal Andhra and Telengana-Rayalaseema region separately. This brought out a few interesting findings coupled with some paradoxes. In the coastal Andhra region, variables like literacy of mother or father do not seem to explain contraceptive use. The significant variables are: media exposure and asset holdings of the household. On the other hand, in the Telengana-Rayalaseema region, mass media exposure and asset holdings were insignificant but literacy of women, work participation outside home have emerged as significant variables in explaining family planning use.

Whether in the coastal Andhra region mass media and some of economic prosperity could have replaced literacy levels of women in promoting fertility reduction cannot be conclusively shown. However, it seems that mass media have played a role in the fertility reduction in these region. Why only in the Telengana-Rayalaseema region, does work participation of women come out as a significant fertility reducing variable? Although it is difficult to give a final answer to this question, it is thought that a region which has rich history of labour organisation and struggle, outside work of women not only provides additional income to the poor household but also expose them, to some extent, to the outside world and gives them a better awareness than possibly a medium like mass media.

Hence, in a nutshell, it is possible that the generous welfare measures undertaken by the government of Andhra Pradesh in poverty alleviation particularly in the 1980s have not only reduced poverty but also have had some impact on the fertility decisions of the people. This, along with the changes in the rural labour market, labour organisation, and other related factors could have created a favourable climate for a decline in fertility, even with a low level of social development.

Notes

[A more detailed version of this paper was presented at a Workshop on 'South Indian Fertility Transition in Comparative Perspective' at Centre for Development Studies (CDS), Trivandrum during April 6-8, 1998. This paper owes a great deal to N Krishnaji's inspiration and extensive comments. I have greatly benefited from the comments during the Workshops at CDS, Trivandrum and also from a seminar at Centre for Economic and Social studies, Hyderabad. I also gratefully acknowledge the critical comments and suggestions made by C H Hanumantha Rao, P Venkatramaiah and Kanakalatha Mukund in an earlier version of this paper.]

1 David Levine considered transition from a regime of high fertility to another in which

human reproduction is controlled as a family revolution. David Levine (1987) *Reproducing Families: The Political Economy of English Population History*, Cambridge University Press, Cambridge, p 1.

2 This argument is put forward by Levine (1987) based on the experience of England in the past century

3 The demographic transition theory is that fertility decline basically occurred in places that moved from a traditional agrarian based economic system to a largely industrial, urban based one. See Notestien (1945).

4 This argument goes in line with Mencher's observation of poverty induced fertility transition among agricultural labourers of Kerala [Mencher 1980].

5 There also other explanations on the fertility decline in India which are not considered here. See Murthi et al (1995), Dharmalingam and Morgan (1996).

6 The percentage of population below poverty line varies considering using different sources. The trend, however, is one of considerable decline irrespective of the source

7 Current daily status is the most comprehensive measure as it combines chronic, seasonal and intermittent unemployment.

8 The increase in the agricultural real wage rate in the 1980s is observed even in other states in India [Unni 1997]

Theory of Convergence and Real Income Divergence 1950-92

Prabirjit Sarkar

This article examines the issue of convergence of the standards of living of the North and the South at the aggregative average and the disaggregative country levels on the basis of internationally and inter-temporally comparable real income data available in Penn World Tables over the period 1950-92. It finds significant evidence of widening gap in the standards of living of the two groups of countries. Only countries such as Korea, Taiwan and Thailand experienced a converging trend. There is some evidence of convergence between less rich North and richer North and between poorer South and less poor South.

THIS article examines whether the poor South is coming closer to the rich North in the process of evolution of the world economy since 1950 – whether the Veblen (1915)-Gerschenkron (1952) convergence/catching up hypothesis holds good along with the convergence implication of the neoclassical growth theory.[1] The issue of convergence of the standards of living of the North and the South is examined at the aggregative average and the disaggregative country levels. To make an inter-temporal international comparison of standards of living, the Penn World Tables (PWT) available through the World Wide Web [see Summers and Heston 1984, 1991 for details of the data source and methodology of construction of the series] are generally used. The PWT displays a set of national accounts time series data covering a large number of countries. 'Its unique feature is that its expenditure entries are denominated in a common set of prices in a common currency so that *real* international quantity comparison can be made both between countries and over time' [Summers and Heston 1991:327].

For measuring the standard of living, a number of PWT series are available on real GDP per capita at constant dollar. We have used the series called RGDPT, real GDP per capita in constant dollar adjusted for changes in the terms of trade. The series uses 1985 international prices for aggregating domestic absorption and current prices for exports and imports to allow for changes in the terms of trade to influence real income.

The PWT data are available over the period. 1950-92. Hence this is our period of study. But the real income data are not available for many countries for all the years. Hence a sample of 64 countries is chosen on the criterion that the relevant data are available at least for the period 1955-86. But data beyond this period are available for most of the 64 countries.

North-South Divergence

Out of the 64 countries, 26 countries belong to the UN category, 'developed market economy' (we shall call it 'Rich' or 'North') and the other 38 countries belong to the category, 'developing market economy' (we shall call it 'Poor' or 'South') – the categories often used in the presentation of UN data.[2]

To examine the question of convergence between poor and rich countries, a cross-country regression, named 'Barro regression', is often fitted:

$$RGPCI_{ti} = a + b.\log(PCI_{0i}) \qquad ...(1)$$

where $RGPCI_{ti}$ is the rate of growth in real income per capita of the i-th country in period t and PCI_{0i} is the level of real income per capita of the i-th country in the initial year.

A positive (and statistically significant) estimate of the regression coefficient, b, found in many studies [Baumol and Wolff 1988; Barro 1991; Mankiw et al 1992; Barro and Sala-i-Martin 1995], is taken as evidence of divergence, called beta-divergence [Sala-i-Martin 1996]: the richer a country is in the initial year (as measured by the initial level of per capita real income), the higher is its rate of growth and vice versa.

An alternative procedure of measuring divergence (called sigma-divergence) is to calculate the coefficient of variation of real income per capita of the whole sample in each year and examine its trend behaviour. There is some evidence of divergence in this measure too [Sala-i-Martin 1996].

In the context of a study of convergence between the poor countries as a group ('South') and the rich countries as a group ('North'), the two procedures may give misleading result. Beta- and/or sigma-divergence found in a study may well be due to divergence across the individual countries belonging to the group. Poor

Notes: 1 Regression coefficients are obtained by fitting the following equation: dlns = c + d.t where t is the time variable, dlns = log(average RGDPT of the North) – log (average RGDPT of the South or the RGDPTs of individual countries of the South). To cure the problem of autocorrelation, an appropriate AR process is chosen in each case. To save space, estimates of only 'd' and the t-ratios (given in parentheses) are reported.

2 Following 26 countries are considered in the sample, 'North': Austria, Belgium, Cyprus, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, the UK, Australia, New Zeeland, South Africa, Canada, the US, Japan, Israel.

3 Following 38 countries are considered in the sample, 'South': Egypt, Ethiopia, Kenya, Morocco, Nigeria, Uganda, Zaire, Costa Rica, Dominican Republic, El Salvador, Guatemala, Honduras, Mexico, Nicaragua, Panama, Trinidad and Tobago, Argentina, Bolivia, Brazil, Chile, Colombia, Ecuador, Guyana, Paraguay, Peru, Uruguay, Venezuela, India, Jordan, Korea, Malaysia, Myanmar, Pakistan, Philippines, Sri Lanka, Taiwan, Thailand and Turkey.

(South)[3] and/or across the countries belonging to the group, Rich (North).

To address the question of Rich-Poor or North-South divergence, intra-group divergence is netted out by aggregation and average real income per capita is calculated: the RGDPT figure of each country belonging to a group is multiplied by its population figure (also available in PWT) to get its total real income, TRGDPT in a particular year. The group total of TRGDPT is divided by the group total population figure to arrive at the figure of average RGDPT of each group. A time trend is fitted to the log-difference between the average RGDPTs of the North and the South over different periods between 1950 and 1992:

$$\text{dlns} = c + d.t \qquad ...(2)$$

where t is the time variable and dlns = log(average RGDPT of the North) – log (average RGDPT of the South).

The estimates are reported in Table 1: In all the decades excepting the 1970s, the estimated time coefficients are positive and statistically significant. This implies that the per capita real income of the South grew at a lower rate than the North and so the initial North-South gap in real income per capita widened over time. Hence the overall picture for the period, 1950-92, is one of significant divergence.

Adding intercept and slope dummies for the 1970s to the regression equation (2), and fitting the equation over the whole period, 1950-92, it is observed that the decade of the 1970s is no exception (none of the dummies is statistically significant):

$$\begin{aligned}\text{dlns} &= \underset{(15.30)}{1.24} + \underset{(2.43)}{0.0067t} - \underset{(-0.44)}{0.05D70} \\ &\quad + \underset{(0.56)}{0.0025SD70} \qquad ...(3)\end{aligned}$$

where D70 and SD70 are the intercept and slope dummies for the 1970s, R-bar square= 0.92, Durbin-Watson Statistic=1.85 and F = 138.27 (t-ratios in parentheses). Here an AR(1) process is fitted through the maximum likelihood procedure.

In the next stage, a quadratic trend is fitted:

$$\text{dlns} = c + d.t + e.t^2 \qquad ...(4)$$

This is to examine whether there is any acceleration or deceleration in the force of widening North-South gap in real income per capita over time. The estimated equation is

$$\text{dlns} = \underset{(32.71)}{1.14} + \underset{(7.18)}{0.026t} - \underset{(-5.46)}{0.00043t^2} \qquad ...(5)$$

where R-bar square= 0.94, Durbin-Watson Statistic=1.89, and F = 238.35 (t-ratios in parentheses).

Equation (5) indicates a deceleration in the force of divergence: the point of inflexion ($t^* = d/2e$) at which the North-South gap is maximum should be 1979. After this point of inflexion, since 1980, the gap should show a tendency to narrow. But this was not the case; rather it is observed that in the 1980s the gap showed a tendency to widen.

There is not much to choose between the log-linear and quadratic equations since the values of R-bar square for the two regression equations are more or less the same.

To examine the individual country cases the log-difference between the RGDPTs of the North as a group and each of the southern countries is regressed on time. Estimates are also reported in Table 1. These show that out of the 38 countries of the south, only 10 countries did not show any significant evidence of divergence away from the standard of living of the North (as measured by the real income per capita figures, RGDPTs). Out of these 10 countries, Morocco exhibited a weak evidence of divergence (time-coefficient is significant at 6 per cent level); in the cases of other four countries (Egypt, Nigeria, Trinidad and Brazil), the time-coefficients are positive but insignificant. Only five countries (Jordan, Korea, Malaysia, Taiwan and Thailand) showed an evidence of convergence or catching up with the North. Excepting Jordan, all the converging countries belong to the category, 'major exporters of manufactures' (of the South) according to UNCTAD (1994).

The convergence experience of Jordan was interrupted in the 1960s and turned into a divergence experience in the 1980s. The convergence experience of Korea and Thailand become significant only in the last two decades, the 1970s and the 1980s while Taiwan had a similar experience since the 1960s. The convergence experience of Malaysia was limited to the 1970s. This is also the case for Morocco, Nigeria and Brazil. In all other decades, these countries experienced significant divergence. Egypt experienced significant divergence in the 1950s and the 1960s and neither convergence nor divergence in the next two decades while Trinidad experienced significant convergence in the 1950s and the 1970s and divergence in the 1960s and the 1980s.

Out of the 28 countries experiencing divergence over the whole period of study, nine countries experienced some kind of convergence towards the standard of living of the North (as measured by the RGDPTs) in the 1970s: Costa Rica, El Salvador, Mexico, Colombia, Ecuador, Paraguay, Venezuela, Philippines and Turkey. Many other countries experienced neither convergence nor divergence during the 1970s. Hence at an aggregative level, there is some evidence of convergence between the standards of living of the North and the South in the 1970s, although this is not confirmed by the dummy variable analysis, as indicated by the estimated regression equation (3).

The decade of the 1970s is one marked by the rise of OPEC and the call for the new international economic order(NIEO). As noted above, most of the southern countries covered in our study did not face divergence in this decade and many even experienced convergence. Not all of them are petroleum exporters. The high expectation of the 1970s was short-lived and the next decade experienced an unprecedented debt crisis when many southern countries

Notes: 1 Estimates are obtained by fitting the following regression:

$dln1n2 = c + d.t$

where $dln1n2$ = log(RGDPT of North-1) − log (RGDPT of North-2 or different countries of North-2). To cure the problem of autocorrelation, an appropriate AR process is chosen. The figures in parentheses are t-ratios.

2 Nine countries of the North with 1950-RGDPT > $5000 constitute North-1: the US, Canada, Australia, New Zealand, Denmark, Sweden, Switzerland, the UK and Luxembourg. All other countries of the North belong to North-2 (for a list of countries belong to North, see Table 1, note 2).

suffered an economic setback. Hence the countries were back to the course of divergence *vis-a-vis* the North.

Convergence within North

To examine the issue of convergence within the north, the countries in the North are divided into two sub-groups on the basis of 1950-RGDPT (for Israel 1953 – figure is considered due to lack of data):
North-1: 1950-RGDPT>$5,000 nine countries.
North-2: 1950–RGDPT<$5,000 17 countries.

Following the procedure described earlier (using population figures), average RGDPTs of the two groups are calculated over the whole period of our study. The log-difference of the two series on average RGDPTs (=dln1n2) is regressed on time over different periods between 1950 and 1992. It shows that in all the decades since 1950, the gap in RGDPTs between the two sub-groups showed a strong tendency to decline (Table 2). But the force of convergence seemed to have weakened in the 1970s and the 1980s. This is confirmed by estimating the quadratic trend equation.

$$\mathrm{dln1n2} = 0.88 - 0.04\,t + 0.00040\,t^2 \quad \ldots(6)$$
$$(22.95)\ (-8.99)\quad (5.63)$$

where R-bar square= 0.99, Durbin-Watson Statistic=2.04, and F = 1184.1 (t-ratios in parentheses).

An AR(2) process is fitted through the maximum likelihood procedure.The estimated equation (6) shows that the gap between the RGDPTs of North-1 and North-2 reaches its minimum value around the year 1990 after which the gap is expected to increase.

At a disaggregative level, it is observed that excepting South Africa, all the countries of North-2 experienced convergence. South Africa, on the contrary, experienced divergence (Table 2). The poorest North-2 country is Portugal with 1950-RGDPT figure as low as $1240. This country also experienced convergence with North-1.

Convergence within South

Let us now examine convergence within the South. There are altogether 17 countries in the South with 1950-RGDPT greater than that of the poorest North-2 country, Portugal. Call this group as rich South or South-1 and the rest as poor South or South 2. It is interesting to examine whether these countries shared the convergence experience of Portugal. Excepting Mexico, none of these countries experienced convergence with North-1. Nine countries experienced strong divergence and seven countries faced neither convergence nor divergence (Table 3).

Through a cross-country study, Baumol and Wolff (1988) observed (on the basis of PWT data) that only the countries which were already rich in 1960 had been coming closer during the subsequent period. This pattern has been noted in many other studies [Sheehey 1996]. An explanation of this pattern can be found in Abramovitz (1986); he argued that the potential to realise the 'advantages of relative backwardness' depends on certain 'social capabilities' that vary positively with income. But the North-South divide remains important. Many southern countries of Latin America and Caribbean were richer than Portugal, Greece and Cyprus in 1950; some of them were richer than even Austria, Ireland and Italy. But they could not join the convergence club of rich North.

Lastly, the issue of convergence within the South is examined. Without dealing with individual country cases (to save space), convergence between the average RGDPTs of the two sub-groups of the South -South-1 and South-2 is considered over the whole period, 1950-92. The estimated equation is

$$\mathrm{dls1s2} = 1.23 - 0.0099\,t \quad \ldots(7)$$
$$(16.34)\ (-3.44)$$

where dls1s2 = log (average RGDPT of the South-1) – log (average RGDPT of the South-2), R-bar square= 0.94, Durbin-Watson Statistic = 1.81 and F = 215.52 (t-ratios in parentheses). An AR (2) process is fitted through the maximum likelihood procedure.

Equation (7) gives significant evidence of convergence in the standards of living of the two sub-groups of the South. In the earlier part of this study, strong evidence of convergence has been found between the two sub-groups of north. This supports the contention of Quah (1996) and

Table 3: Convergence of Real Income Per Capita between Rich North and Rich South, 1950-92

	(4.91)	(2.62)			

Note: 1 Estimates are obtained by fitting the following regression:
dln1s1 = c + d.t
where dln1s1 = log(RGDPT of North-1) – log(RGDPT of different countries of South with RGDPT > $1240). To cure the problem of autocorrelation, an appropriate AR process is chosen. The figures in parentheses are t-ratios.
2 For countries in North-1, see Table 2, note 2.

prediction of some theoretical growth models [Galor 1996]: existence of convergence clubs – one for the poor and the other for the rich.[4] In the process of growth during the post-second world war period, 1950-92, the poorer southern countries had been coming closer to the richer countries of the South in terms of standard of living. Similarly, the less rich northern countries are coming closer to the richer countries of the North. But the gap in the standards of living of the North and South has been widening during the same period.

Summary and Conclusions

The sample of 38 poor countries (called the South) studied here experienced a lower rate of growth in their average real income per capita (RGDPT) than what is experienced by the sample of 26 rich countries (called the North). Hence the gap in the standards of living between the two groups has been widening over the period of our study, 1950-92. Between 1950 and 1992, the RGDPT of the South increased almost threefold – from $1087 in 1950 to $3027. During the same period, the RGDPT of the North increased almost fourfold – from $3548 in 1950, to $13047.

There is some diversity in individual country experiences. But there is one experience shared by most of the southern countries in the decade 1970s which was marked by the rise of OPEC and the optimism of the new international economic order. This was a temporary relief from the trend of divergence from the better standard of living of the North. Some countries even experienced a significant tendency towards convergence/catching up. So the overall picture of the 1970s is one of a catching up trend.

Another notable thing in individual country cases is the steady catching up experience of Korea and Thailand since the 1970s and of Taiwan since the 1960s. These countries belong to the category, 'major exporters of manufactures' (of the South). This experience is not shared by other countries belonging to the same category, such as Brazil, Mexico and Turkey.

Countries of the North experienced convergence among themselves. Bottom 16 countries of the North (RGDPT < $5,000) experienced a catching up of the average standard of living of the top nine countries (RGDPT >$5,000). In 1950 the average RGDPT of the top nine was more than double the RGDPT of the bottom 16. From $2,662 in 1950, the average RGDPT of the bottom 16 increased more than fourfold to reach the figure $12,204 in 1992 while the average RGDPT of top nine grew less than three times from $6,193 in 1950 $14,814 in 1992. Thus the standards of living of the two sub-groups of the North came much closer.

While Portugal, the poorest of the northern countries in 1950, had been coming closer to the average standard of living of the top nine of the North during the period of study, the southern countries richer than Portugal in 1950, did not share this experience. Rather, these southern countries came closer to the poorer South.

While the gap in the standards of living of the North and the South had been widening during the period of our study, there is some evidence of deceleration in the pace of divergence. Hence there is some hope that the gap will not widen indefinitely.

At the same time, the pace of bridging the gap between the top nine and bottom 16 of the north showed some sign of deceleration. If this trend continues, the process of convergence may come to a halt and some gap will remain.

Notes

1 Some authors [see Barro 1991, Mankiw et al 1992, Barro and Sala-i-Martin 1995] argue that neo-classical growth theory does not have an 'absolute' convergence implication; it predicts 'conditional' convergence – the countries that are similar in all respects except for their initial level of output per capita are expected to converge to the same steady-state level of output per capita.

2 'Developed Market Economy' covers western Europe, the US, Canada, Australia, New Zealand, Israel, Japan, South Africa. All other countries excluding socialist and ex-socialist countries belong to 'Developing Market Economy'.

3 Sarkar (1998) found beta divergence among the countries of the South in a study based on UN data.

4 This contradicts my earlier study [Sarkar 1998] based on cross-country regression. A quadratic version of Barro regression was fitted to the North and the South and sub-groups were made on the basis of regression parameters. The linear version of Barro regression was fitted to each sub-group and there was no evidence of beta convergence within these sub-groups.

TAX PLANNING NOW

LIFELONG PENSION OR LUMPSUM SAVING WHEN YOU ARE 58

UTI Retirement Benefit Plan

The Retirement Benefit Plan is perhaps the most complete security plan you can find. It works from the day you invest. Under Section 88 of the I. T. Act, it gets you a 20% tax rebate. All you need to do is invest between the age of 18 and 60 years. The Plan will do all the earning on your behalf. If you have invested before the age of 52, you will start receiving a monthly pension as lifelong security, when you are 58. And those who invest after the age of 52, are eligible for the same, 5 years from the date of joining. Alternatively, you also enjoy the option of claiming a lumpsum saving. Of course, the earlier you invest, the more you stand to benefit. So, start collecting Pension Units regularly. It's a sure way of ensuring that your life tomorrow is as secure as it is today.

UNIT TRUST OF INDIA

For your better tomorrow

Pension Units from UTI. The more you collect, the more secure you'll be.

Risk Factors. All investments in mutual funds and securities are subject to market risks and the NAV of schemes may go up or down depending upon the factors and forces affecting

Indian Institute of Management, Ahmedabad

announces

Fifth Summer School for College Teachers
on

Management of Common Property Resources

June 4-13, 1999

An inter-disciplinary course with special emphasis on ecological economics perspective is organized to equip young teachers in theory and practice of common property resources. The course will also deal with special sectoral areas such as forestry, fishery, grazing lands, water, etc., apart from conceptual issues in transaction costs, politicial theory of institutions, organizational theory, participatory action research, etc.

Who Can Apply?

College teachers with background in economics, sociology, political science, anthropology, agriculture, ecology and related disciplines having strong interest in teaching and research in common properties with post-graduate degree and some evidence of idependent work can apply. Preference will be given to teachers from the colleges located in ecologically disadvantaged regions such as hill areas, drought and flood prone areas, forest regions, etc. International candidates are also welcome to apply. Scholars registered for Ph. D. or working with voluntary organizations can also apply.

How To Apply?

The selected candidates will have to pay Rs. 7,500 towards the cost of boarding, lodging and a set of teaching material. There is no course fee. Participants will bear their own travel expenses. Candidates may apply with a two-page note on their plans to pursue research and teaching in this area, along with (a) a case study of any local/indigenous institution for common property resource management, (b) a copy of bio-data and (c) list of publications, to the **Programme Officer, Centre for Management in Agriculture, Indian Institute of Management, Vastrapur, Ahmedabad- 380 015, Gujarat**, latest by April 15, 1999. Waiver of partial or full charges is possible for deserving candidates.

Overcoming Barriers

A comparative study of the steel industry in three late industrialising countries, Korea, India and Brazil shows that state intervention does not guarantee technological progress and that the weak institutional basis of the state undermined the development of a technologically dynamic steel industry. M-2 In the context of the drastic change the global textile trading regime will undergo from 2005 with the phasing out of the MFA the nature of competition that Indian primary textile firms face domestically and abroad will change. A study of such firms in India, China and Canada. M-17 Deregulation of the coal sector by itself may not lead to accelerated investment, expansion in production and competitive market conditions resulting in cost and price efficiency. An attempt to outline an ideal regulatory mechanism based on the experiences of other economies affected by the process of liberalisation. M-25 While governments in developing countries are delimiting their roles in economic matters, developed countries are putting in place a number of support measures to encourage private sector to invest in R and D. M-34

The Air Women Breath

Pollutants released during the burning of biofuels in traditional stoves affect women and children under five years the most. Designing better stoves is a limited solution. Macro policies need to be reconstructed such that safer and clean cooking fuels become available cheaply. 539

Fixing Prices

Drug pricing in India is quite haywire: the same drug is available at three different prices which indicates that drug companies can quite profitably produce drugs at the lowest prices that they are sold. 514

Himalayan Water Politics

The Mahakali Treaty between India and Nepal, all but forgotten now, was signed in haste ignoring the serious problems the project posed. Are there lessons to be learnt here for the future of India-Nepal water politics? 553

Christians and STs

While much is made of the fact that in three states, with large tribal populations, Christians form the majority, census data indicate that they are the slowest growing religious community. 524

Downtrends

The composition of industries in Maharashtra has undergone considerable change; several factors indicate that industrial activity in the state has been poor. Can the state continue to hold the comparative advantage in this area as it once did? M 39

Understanding Cultures

The future of anthropology can be enhanced by giving primacy to an interpretive understanding of societies and cultures, leading to more perceptive and relevant response to social development policies. 545

Revitalising Care

If missionary hospitals are to cope with the current financial crunch they face, they will need to review and rationalise the distribution of their services. 521

Imported Hazards

The dumping of hazardous wastes is an issue which in recent times has prompted widespread protest and, laterally, public awareness of related technical and health issues. Governments are being forced to take notice. 527

Gujarat's Woes

Agricultural production and productivity have experienced a downward trend in Gujarat. Why has this happened? 519

Panchayats and VAs

With the revitalisation of panchayat institutions voluntary organisations can play a crucial role as partners. 529

Remembering the *EW*

I BELIEVE one should not flaunt what one does out of conviction. There is a certain charm in keeping such acts as seductive secrets. I would not have deviated from this time-honoured code, but for the hesitantly raised question "should not one also mention Anand Chandavarkar, Vinoo Bhatt and Deena Khatkhate?" by Ashok Mitra in his article 'Fifty Years Ago' (January 9).

During the period 1956-68, a gang of four – Anand Chandavarkar, Vinoo Bhatt, M Narasimham and myself – regularly but anonymously wrote for the *EW* and its sequel, *EPW*, disregarding the risks involved. One of the four subsequently occupied all the important policy-making positions in the government and the Reserve Bank. There were weeks when two or three editorial notes were authored by us. At times we wrote notes on subjects on which we among ourselves disagreed so that the policies being commented on should generate public debate. Some of the leading controversies of the 1950s and 1960s, on planning, balance of payments, choice of techniques, inflation, etc, could be attributed to the clandestinely written articles by this group. The famous ones on planning by Vinoo Bhatt under the pseudonym Savyasachi and 'Aid and Advice' by Narasimham annoyed the government of India's economic advisers, who themselves were close to Sachin and the *EW* and *EPW*, to such an extent that one of them admonished Sachin for publishing "such trash". Sachin, as was his style, kept objectivity and dedication to truth as he saw it above friendship and simply laughed away these petulant reactions of his friends. Narasimham's piece, critical of the IMF and the World Bank, was taken so seriously that it has figured prominently in the World Bank's latest history written by John P Lewis and Devesh Kapur. Unlike several other anonymous writers for the *EW* and *EPW*, no one among the four RBI economists accepted payment. Once A Fernandes, Sachin's Man Friday, approached Vinoo Bhatt and me with cheques, but he promptly withdrew when he saw the frown on our faces. That was the period that was, with all the intellectual excitement, thrills and fun.

In late 1965 when the *EW* was in the doldrums with a grim future staring it in the face, Sachin was frantically looking for funds to set up a trust. Only about Rs 20,000 or thereabouts were in the kitty. It was at that moment that I raised 20,000-25,000 rupees, the major contributions being from Shapurji Pallonji, Khatau and Russi Karanjia of the *Blitz* and Narasimham, Bhatt and I chipping in with the rest.

My own introduction to Sachin and the *EW* was eventful, with a touch of drama and trauma. I had just joined the RBI. My first assignment was to prepare a research paper on measuring deficit financing in India. Vinoo Bhatt, thinking that the paper was well-suited for the *EW*, passed on a draft to Sachin who then asked me to prepare a version for publication. Being a brash young man and innocent of the ways of the world, I published a shorter version in the *EW*, unmindful of the consequences of my action. I got myself into immediate trouble when the RBI authorities noted the similarity in content between my internal RBI paper and the one published in the *EW*. I would have been fired but for the intervention of a compassionate soul. Sachin always carried a sense of guilt for unwittingly landing me in the soup. I clearly recall telling him that I was an adult and should take full responsibility for my action.

DEENA KHATKHATE

Mumbai

Half-Truths

I REFER to the letter written by Sukla Sen, P G Ram et al titled 'Savarkar Memorial' (December 26, 1998) which is full of many half-truths and is prejudiced and biased against Savarkar. Savarkar never preached fascism, to him anyone who had a 'sense of belonging' to India was a Hindu. But the so-called pseudo-secularists have themselves adopted the Goebbelsian technique of repeating tirelessly lies against anybody who propagated Hindu thought and philosophy.

It is difficult to contradict the statements and non-sequitur generalisations in the letter, as it has become fashionable to dub Hinduism as fascist and fundamentalist and guilty of aggression. Just one or two facts. It was not Savarkar alone who kept aloof from the 'Quit India movement'; eminent thinkers like M N Roy and C Rajagopalachari also did not support the 1942 movement. The Communist Party, for its own policy of supporting the Soviet Union, made a *volte face* and supported the British war effort. Subhash Bose fought for Indian independence according to his own lights.

In his Sardar Patel memorial lecture delivered on Akashwani, Delhi, in October 1998, the eminent scientist A P J Kalam raised the question as to why it is that in its over 2000 years' recorded history, India has never been known to have committed aggression and annexed any territory. It is so, he seemed to suggest, because of the basic Hindu (Indian) stance of non-aggression; this is the Hindu mind, which it has become fashionable to vilify. Hindus cannot be fundamentalist and aggressive in contrast to the Christian and Islamic philosophy of aggression and proselytisation. Will the letter-writers address themselves to the question raised by A P J Kalam and desist from the attempts to vilify Hindus?

The letter pours venom against Savarkar and the RSS, making baseless allegations, using the pejorative term 'fascists' again and again. This reflects small minds and prejudiced, frivolous outpourings, which fly in the face of historical facts and truths.

Pune

ECONOMIC AND POLITICAL WEEKLY

A Budget of Small Things

AGAINST the background of the cacophony of noises on economic policy that had been emanating from the parties constituting the BJP-led ruling coalition and from organisations closely associated with the BJP itself, the central government's budget for 1999-2000 may be said to have come as a relief, if not exactly as a pleasant surprise.

The least convincing part of the budget is the finance minister's claim that he has "set in motion a medium-term strategy for restoring the fiscal health of our economy". The budget aims to reduce the revenue deficit by 0.7 per cent of GDP and the fiscal deficit by 0.6 per cent and it is the finance minister's hope that, at this rate, in four years the revenue deficit would have been eliminated and the fiscal deficit brought down below 2 per cent of GDP. However, it has been the staple story of the last many years that each year the actual revenue and fiscal deficits have significantly exceeded the budget's expectations. There is nothing about the quality of this budget's estimates of revenue and expenditure to inspire any particular confidence that the coming year is going to be an exception to this rule. Reduction of the revenue and fiscal deficits hinges critically on the government's ability to control its revenue expenditure which calls for much more than the symbolic abolition of the posts of four secretaries to the government. To carry the process further, the finance minister has promised to set up an Expenditure Reforms Commission. In fact he could have taken another look at that part of the last Pay Commission's report where it had proposed abolishing a significantly larger number of secretaries' positions and several ministries to reduce the total staff strength of the government by almost a third.

It is also difficult to be convinced that there is much in the budget which will set in motion a process of industrial revival. This is not to suggest that the finance minister should have attempted to use the budget to kick-start industry, as he had been so often urged from different quarters to do. In fact it is to be welcomed that he has resisted the temptation to show large increases in Plan expenditure as part of a proclaimed effort to boost economic growth. The simple fact is that year after year the concerned government departments and public sector undertakings have failed to fully spend the Plan allocations provided in the budget, including for the infrastructure sectors the need for larger outlays on which is universally accepted. Thus the shortfall in the centre's Plan outlay was Rs 9,568 crore in 1996-97, Rs 10,806 crore in 1997-98 and as much as Rs 16,705 crore in 1998-99. Clearly, a good part of the explanation lies in the fact that so little has been done to restructure public enterprises to render them better capable of serving as agencies of productive investment and growth.

True, the situation facing Indian industry today is not that of a typical cyclical recession calling for remedial action in terms of stepped-up government expenditure. In that sense it would be best as well not to entertain extravagant expectations of the effort by the Reserve Bank to lower interest rates of which the finance minister has given an advance indication in his budget speech. The state of the economy, of industry and infrastructure in particular, calls for far-reaching organisational and strategic changes by private sector companies and business groups as much as by public sector enterprises. It is hardly surprising that such should be the case, considering that these entities had struck roots mostly during the long years of industrial regulation and licensing and protection against imports. The initial spurt in industrial growth after the initiation of the economic reforms in the early nineties was to a great extent little more than a quick response on the part of industrialists and businessmen to opportunities which were hastily perceived as having been opened up by the new industrial regime. In retrospect it is clear that a good proportion of the projects initiated in that heady period are likely to prove to be of doubtful viability in a more competitive and open economy with progressively lower import tariffs. The finance minister has accepted the importance of corporate and industrial restructuring and the very first item of his direct tax proposals relates to changes in the Income Tax Act to facilitate industrial reorganisation through amalgamations and mergers. This is certainly a positive signal. However, as important as tax policy changes are reforms in other areas, importantly labour laws and regulations. Also important is a willingness on the part of official agencies, especially the financial institutions, to accept the rationale and inevitability of management changes.

The proposals of the budget which have had an immediate and quite spectacular impact have been the ones designed to boost the capital markets. These include exemption from income tax of all income from mutual funds, including the UTI, in the hands of investors, the exemption of all open-ended equity-oriented schemes of the UTI and other mutual funds with more than 50 per cent investment in equity from dividend tax and the option offered to resident investors to

have their capital gains from shares and securities taxed at the rate of 10 per cent but without the benefit of indexation – on par with non-resident investors. However, it is difficult to share fully the markets' euphoria because a booming capital market can only go so far in reviving industrial investment in the absence of, as noted above, essential industrial and business restructuring, including of course of government-owned companies. It is doubtful that there are a significant number of investment proposals which have been waiting upon the revival of the capital market. In a situation such as this there is in fact the danger that another price boom in the markets may be taken advantage of once again by fly-by-night promoters with predictable consequences. We have been through this cycle more than once.

The changes which the finance minister has introduced in indirect taxes are indeed to be welcomed. In fact, in another break from tradition, the finance minister has given precedence in his budget speech to his indirect tax proposals over his direct tax proposals. The rationalisation of the rate structure of excise and customs tariffs, though far from complete, is a long-awaited step which has been an important part of numerous recent reports and recommendations on the subject of tax reform. It is also good that the finance minister has moved away from the practice of making a large number of changes in tariffs for individual industries and products. This no doubt accounts for the disappointment with the budget voiced by a number of industry associations. But the fact is that while these kind of changes in tariffs have been traditionally the object of intense lobbying on the eve of budgets in the past, their rationale from a broader perspective of encouraging investment and production has been clearly suspect. So it is to be hoped that the present finance minister's successors will continue with the practice he has started. The surcharge on corporate tax, on the other hand, defies logic in the context of the current industrial situation. The surcharge on personal income tax is unobjectionable; in fact there is an opinion among economists and tax experts that the reduction in personal income tax rates effected by the present finance minister's predecessor should have been more graduated and in that sense an upward adjustment of the personal income tax rates on a permanent basis instead of through a temporary surcharge could have been justified. On the other hand, given the state of industry, the surcharge on corporate tax was hardly the appropriate signal for the budget to have sent out. And the finance minister has only made matters worse by assuring industry that this is a purely temporary measure. How does it make sense to raise the corporate tax when industry is doing badly and to promise to reduce it when it is, hopefully, doing better?

RAILWAYS

Rhetoric and Reality

THERE is much to commend the intent of the Railway Budget presented by the minister Nitish Kumar. But not all the rhetoric at his command can hide the fact that the prestigious, crucial service and industry that is the railways, is in dire trouble. Not because of any inherent deficiency, nor for that matter because the railways are an aberration in the context of structural change and modernisation; but almost entirely due to the fact that the development of this vital sub-sector has been prompted more by populist pressures than pragmatism and planning. If today Nitish Kumar has presented a 'passenger year' budget for 1999-2000, introducing 14 new routes, allocating a remarkable 59 per cent increase in funds for guage conversions, 'rationalising fares' such that the 'poor' including the highly subsidised urban commuters are left untouched quite ignoring the fact that the railways' earnings have dropped, especially because of poor uptake of freight traffic, he is after all following in the footsteps of illustrious, even radical ministers of earlier governments. Even worse, there appears to be little comprehension of the fact that the deteriorating safety record of the railways has a lot to do with the lack of consistent, adequately staffed and well supervised maintenance of track and rolling stock. Reversing these trends requires the kind of investments which cannot be used as election fodder. For instance, track renewals have been granted a small 19 per cent increase over last year, clearly nowhere near enough to ensure all the necessary replacements requiring a prioritisation of funds. This may not contribute to safety. The minister in his speech pointed out other measures that will be taken this year. Recognising that several accidents occur due to rail fractures and weld failures the ministry has decided to purchase two high speed self-propelled ultrasonic rail testing cars to facilitate track checking; walkie-talkies are being provided to all drivers and guards on all A and B routes; track circuiting is being undertaken and a pilot project of a radio-based automatic train control system is being instituted. There are 24,359 unmanned railway crossings, converting which to manned crossings would require according to the minister an outlay of Rs 2,200 crore. Typically, the minister has decided to create a fund for the task. More interestingly now it is possible for MPs to demand area development funds for converting unmanned crossings in their constituencies. It would be interesting to see how often such requests will be made for such unspectacular 'development' projects.

That the year 1997-98 was not a favourable year for the railways is acknowledged – while the loading of petroleum products and fertilisers and 'other goods' was higher than the previous year, budgetary targets for coal, foodgrains, iron and steel, cement and iron ore have not been met. These are core areas and the railways' poor performance here has affected the budget. While the railways' operating ratio has admittedly improved from the last year's revised estimate of 91 per cent, it has been only marginally to 90.9 per cent and is nowhere near the 82.5 per cent in 1995-96. This means that for all the rhetoric in the minister's speech funds available for maintenance and expansion have been greatly reduced. And given the fact that there has been no curtailment in the expansion of services, it will be maintenance which will bear the brunt of this squeeze.

There also appears to be little thought given to bringing back the freight lost to the railways. Instead there is a move to seek out other areas. For instance, special measures have been suggested to encourage parcel traffic. While this may be a commendable effort, it surely cannot make up for the loss of freight in the core areas. It is of course true that the loss of freight in areas such as cement, iron and steel has also a lot to do with the lack of movement and demand because of stagnation in the economy. Even so, from all points of view, including environmental, it is necessary to ensure that the railways continue to move most of the core goods.

In all this perhaps the only component of the budget which brings cheer is the bold step of banning the sale of tobacco on railway stations and on trains. And even this may be open to change with the kind of pressures that can be brought on the ministry by influential tobacco interests.

PUNJAB

Religion and Politics

IN the Akali Dal where politics and religion are deeply intertwined, any attempt to demarcate their domains runs the risk of creating schisms within the party. The acrimonious struggle which has broken out between the Badal and the Tohra factions over the tercentenary celebrations of the birth of the Khalsa is a case in point.

Former Akal Takht jathedar Bhai Ranjit Singh and Shiromani Gurudwara Prabhandak Committee (SGPC) president Gurcharan Singh Tohra had declared in December that since the tercentennial to be held in April was a religious function, the government should not interfere in it and should channelise the funds for the event through the religious body, the SGPC. Tohra went a step further and against the backdrop of the Akali Dal's defeat in the Adampur by-election advised Punjab chief minister Parkash Singh Badal to step down from the presidentship of the party and concentrate on improving the government's performance. Tohra's advice on party affairs was bound to be interpreted as mischievous by Badal since at the same time, as the SGPC chief, Tohra was taking up cudgels to defend the autonomy of the religious domain on the eve of the Khalsa ceremony. Badal was quick to cut Tohra down to size by slapping a show cause notice on him for breach of party discipline as Tohra is also a Rajya Sabha member representing the Akali Dal.

In the ensuing battle for supremacy, Badal has so far succeeded in systematically decimating the Tohra camp, both within the party and in the SGPC. Tohra lacks the necessary support to engender a split in the party. He does not also enjoy a majority in the 15-member executive council of the SGPC despite his unbroken 25-year run as SGPC president. Badal, on the other hand, by tightening his grip over the party, the SGPC and the three-member Sikh Gurudwara Judicial Commission has forced Tohra into a corner. Assured of support in these three main religio-political bodies, Badal has not hesitated to confront former Akal Takht jathedar Bhai Ranjit Singh as soon as he was perceived to be protecting a beleaguered Tohra through his 'hukumnama'. In fact, the three-month war of attrition in Akali politics has shown that Bhai Ranjit Singh and Tohra clearly lack the wherewithal to dislodge Badal and have instead been reduced to offering their resignations from their respective religious posts if Badal agreed to accept their conditions. The Khalsa tercentenary celebrations may eventually witness parallel mobilisations by the Badal and Tohra camps. But the boundaries between politics and religion remain fuzzy as before. By marginalising Bhai Ranjit Singh and Tohra, Badal has succeeded in bringing the Akal Takht and the SGPC under his political influence.

INDUSTRY

Structural Constraints

A correspondent writes:

THIS is the season for coming forth with suggestions and advice to the finance minister, whose second budget is round the corner. The economy is stagnant and there is no sign of a recovery on the horizon. Exports are slothful and though foreign exchange reserves have risen, they can evaporate as easily as they have accumulated as much of these reserves are due to NRI investment. Though the rate of growth has received a prop from some sleight-of-hand by the CSO, its tenuous base is likely to be exposed sooner or later. In the meantime the fiscal deficit is ballooning and no one knows how to rein it.

The remedies suggested by the experts are many. It is more like looking for a needle in pitch darkness. Control of the fiscal deficit is the obvious panacea, but the political reality is such that it is a virtual non-starter. There may be some gimmicks used to show a lower fiscal deficit but it will not make a whit of difference to the basic problems of the economy. Given this imperative, one may think of jacking up public investment but learning from the past experience such investment will be leaky, bereft of any contribution to production. In such circumstances, growth of public investment would be a sure recipe for inflation and further turmoil in the economy.

Manu Shroff in his presidential address at the Annual Conference of Gujarat Economic Association has made a persuasive case for a low interest rate policy. Even considering that such a policy is not without risk of fuelling inflation, he thinks that it has some potential, though a limited one, to jump-start a recovery, at least in the industrial sector. He has proposed an interesting idea regarding measurement of real interest rates. Since the industrial sector is the principal stagnant sector, the real interest rate relevant for it is the one adjusted on the basis of the price index for manufactures. The current real interest rate so calculated works out to around 7 to 8 per cent which is historically a very high rate. Given the poor profit expectations in the surrounding gloom, it is clear that high real interest rates are a real drag on the economy when capacity utilisation is hardly 30 to 40 per cent.

While the underlying logic of Shroff's suggestion is sound, it is no more than a placebo. It would certainly propel industrial growth for a while but is not likely to resolve the main problem of structural reform of the industrial sector and the economy. Shroff's premise that the present industrial stagnation is cyclical in nature is suspect. The basic constraints are structural, in that production is high cost and therefore uncompetitive. Several industrial units boast of very diversified production, thinly spread without comparative advantages. They could survive in the past but in today's environment they have to take hard decisions to downsize and to divest themselves of activities which cannot be sustained. In fact, available evidence, while episodic, shows that Indian industry is moving slowly to downsize its operations by shedding unviable activities, offering voluntary retirement schemes and focusing on core functions. The results of this movement towards a competitive structure will be apparent in the next few years.

What the government should do, but is shying away from doing, is to take a bold decision to adopt policies directed towards elimination of labour market rigidities to facilitate downsizing and even closure of industrial units. In the meantime a low interest rates policy could help, but only as a stop-gap arrangement to provide interim relief to industry.

Another component of demand that could help moderate the industrial recession is exports. Evidence seems to point to Indian exports having a cost disadvantage, both short-term and long-term. The short-term infirmity can be removed by gradual devaluation of the rupee, to bring the exchange rate in alignment with India's competitors, the east Asian countries in particular. But the long-term disadvantage is deeply rooted in the absence of infrastructural facilities like ports, communication, transport and power. Unfortunately, there is more talk on this than real action. Unless the authorities take the bull by the horns, reduction of interest rates or even reduction of the fiscal deficit by itself will not save the economy from the corrosive impact of structural stagnation.

CURRENT STATISTICS

EPW **Research Foundation**

A feature of the revised national income series and the index of industrial production has been the widening disparity between the growth rates of the registered manufacturing sector and the IIP for manufacturing. While for the second half of the 1980s the IIP growth was higher than the GDP of registered manufacturing (7.5 per cent) which continued for two more years until 1991-92, thereafter the position got reversed. As per the 1980-81 series, the average growth of registered manufacturing was 10 per cent, whereas the IIP growth was 8 per cent. In the revised series the differential got further widened to 11 per cent and 7.5 per cent, respectively

BIRLA VXL

Corporate Restructuring

BIRLA VXL, the flagship company of the S K Birla group, saw a mixed performance during the year ended June 1998. While net sales were lower by 3.4 per cent in 1997-98, the company's operating profit improved significantly by 28.5 per cent over the previous year. (Figures for the years 1997-98, 15-month period, and 1996-97, 12-month period, are not strictly comparable, but all percentages have been annualised for comparison.) However, the absence of a large non-operating income (1996-97: Rs 25.7 crore) and a sharp increase in interest (up 15.7 per cent) and depreciation provision (up 41 per cent) led to a marked decline in net profit during the year under review.

Despite the fall in earnings, the company declared a dividend of 10 per cent and had to dip into reserves to distribute the same. (The fall in earnings per share (EPS) shown in the table is due to the fact that preference dividend has been deducted from the company's net profit while deriving EPS.) Consequently, the company's book value declined from Rs 41.6 per share last year to Rs 39.5 per share. The company's equity share presently quotes below par on the bourses.

Birla VXL is engaged in the production of cloth, blankets and shawls, yarn, garments, soda ash and alkali chemicals. Known for its Digjam brand of woollen and worsted fabrics and OCM brand of carpets and carpet yarn, the company also exports its products to the United States, Canada, West Asia and the Far East.

In order to improve its performance, the company now plans to focus on its core business of textiles and is reportedly weighing the possibility of hiving off its chemicals division into a separate company. The Sauken chemicals division, which makes soda at Porbandar in Gujarat, contributed almost half of the company's earnings in 1997-98. However, the costs incurred by the division have been higher than the industry average. As compared to a cost of Rs 151 per tonne of salt incurred the market leader Tata Chemicals, the division pays Rs 348 per tonne of salt. The division's cost of power is also much higher as it has an old power plant. However, it is also true that Birla VXL occupies the third spot among soda ash makers with a market share of 18 per cent. The proposed strategy involves transferring the chemicals division to a new company at a book value of Rs 61.13 crore, which is the difference between the division's assets and liabilities. Birla VXL shareholders will be issued shares of the new company at par.

The company has also sought restructuring of loans worth Rs 165.6 crore to tide over financial difficulties. The proposal forwarded by the company envisages, among other things, pushing back interest payments to a later date and swapping foreign debt with rupee loans.

The beleaguered company is trebling the manufacturing capacity of its garment unit from three million pieces per year to nine million pieces annually. The company's state-of-the-art garment unit near Delhi manufactures high quality formal trousers.

DR REDDY'S LABS

Rapid Growth

Dr Reddy's Laboratories (DRL), a Hyderabad-based pharmaceutical company, performed well in 1997-98. While net profit improved by 31.9 per cent over 1996-97, operating profit was higher by 52.5 per cent. Net profit too jumped by 45.7 per cent. Though earnings per share rose from Rs 12.7 to Rs 18.4, the company decided to maintain dividend at 30 per cent. Book value, meanwhile, moved up from Rs 113.5 per share to Rs 128.7 per share. The company's equity share presently quotes at around Rs 699 on the bourses, discounting its earnings per share by a comfortable 37.9 times.

The company's formulations, which achieved a growth rate of 57 per cent to Rs 207 crore, were major contributors to turnover. Domestic formulations accounted for Rs 136 crore, 39 per cent higher than that in 1996-97. The company's bulk drug division registered sales of Rs 115 crore while the diagnostics division notched up sales of Rs 10 crore, up from Rs 5 crore in the previous year. The company reportedly achieved a major breakthrough with the discovery of the potential insulin sensitiser by Dr Reddy's Foundation. The same has been licensed to Novo Nordisk of Denmark. The company's critical care unit will also market (in India) molecules which were discovered and patented by Debiopharm, including a new platinum analogue oxaliplatin for cancer.

The company's exports increased by more than 50 per cent during the year under review and it has a presence in the CIS countries, Myanmar, Vietnam and Sri Lanka. The company is also trying to establish its foothold in Kenya, Malaysia, Yemen, Venezuela, Trinidad, China and Brazil.

The company has acquired five brands from Calcutta-based pharma company, Dolphin Laboratories, at a cost of Rs 20 crore. Out of the five brands acquired, Styptovit, Styptomet and Styptochrome are haemostatics, Doxt is an antibiotic and Trichodol is a hepato-stimulant protective indicated in the treatment of acute and chronic liver diseases. DRL has also acquired the manufacturing and marketing rights for a sixth brand, Dicynene, which is also a haemostatic. These additions to the company's portfolio are expected to add Rs 25 crore to its turnover in the first full year of marketing. The company's brand equity with gynaecologists, surgeons, ENT and chest physicians, dentists and gastroenterologists is also expected to be strengthened.

Meanwhile, in the first half of 1998-99 the company has achieved a growth of 43 per cent in net profit over the corresponding period last year. However, if one takes into account a provision for export receivables, the growth amounts to 5 per cent. Total income was higher by 30 per cent during the same period.

DRL has managed to collect receivables of over three million dollars from the Commonwealth of Independent States (CIS) in the third quarter of the current year. However, despite this, the company intends to stick to its provisioning for write-offs as resolved in the first half of the current year. While sales during this period improved by 18 per cent over the same period last year, the domestic formulations division posted a growth of 69 per cent to Rs 40 crore. The company's local bulk business clocked sales of Rs 22.6 crore, an increase of 36 per cent over the same period. The company expects lower exports to CIS and softening of bulk drug prices to result in a more moderate 24 per cent turnover growth in the full year ending March 1999.

UNITED PHOSPHORUS

Lower Sales and Profits

A major player in the pesticides business, United Phosphorus has set up 13 companies internationally to become a global player. Over the years, the company has seen a transition from a totally technology driven entity in the seventies to a manufacturing entity in the eighties. In the late eighties, the company got into distribution and marketing and invested

NA: means not available.

a lot of its resources in the overseas market. The company today has eight products registered in the US.

The company had earlier hived off its chlor-alkali business into a separate subsidiary as the unit was not doing well, but the strategy seems to have not paid off. The downturn in the Indian economy and the agrochemical industry in particular adversely affected the company's performance in 1997-98. The industry witnessed reduced demand and a consequent dipping of bottomlines of major companies in the sector, and United Phosphorus was no exception. Prices of agrochemicals have come down drastically all over the world and this has affected profitability very badly. While the company's net sales declined by 9.2 per cent over 1996-97, operating profit fell by 17.5 per cent over the same period. Despite a 35.9 per cent fall in interest charges, the company's net profit fell drastically by 23.1 per cent.

Despite earnings per share coming down from Rs 10.1 last year to Rs 7.3, the company decided to maintain dividend at 30 per cent. Book value, meanwhile, moved up marginally from Rs 149.1 per share to Rs 150.8 per share.

The company's stock presently quotes at around Rs 122 on the bourses, discounting its 1997-98 earnings per share by 16.7 times.

For the first half of 1998-99 the company has managed to improve its performance. While net sales increased by 11.3 per cent over the corresponding period last year, operating profit surged ahead by 40.7 per cent. Net profit too improved by around 50 per cent.

Larsen & Toubro

L&T, the engineering giant, plans to acquire a 70 per cent stake in the Chowgule group company Narmada Cement (NCCL). Apart from acquiring shares from the Chowgules, L&T will also make a public offer for shares under the SEBI's take-over code. NCCL has a clinker capacity of 1.2 million tonnes per annum at Jaffrabad in Gujarat and an aggregate cement grinding capacity of 1.4 million tonnes per annum at Jaffrabad, Magdalla (Gujarat) and Ratnagiri (Maharashtra). L&T already enjoys a leadership position in the cement industry and the takeover is expected to further strengthen it. It will also see the company emerge as India's largest cement company with a capacity of 12 million tonnes per annum. With its existing infrastructure, L&T believes that it will be able to realise the full potential of NCCL. It will be possible to raise NCCL's clinker capacity to 1.4 million tonnes per annum with a marginal investment.

How Many Aspirins to the Rupee?

Runaway Drug Prices

S Srinivasan

Government intervention has kept Indian drug prices from spiralling. Different sectors of the pharmaceutical industry have reacted differently to the policies. There is confusion about what are reasonable prices and profits.

DRUGS have generally been beyond the reach of most people, most of the time, during the 50 years of our independence. There was of course a period in the late 1970s and early 1980s when drug prices were affordable – to the middle class – if taken in small doses. However costs of total treatment, and costs of getting sick, have been if anything but affordable.

Two important policy interventions had helped keep drug prices from spiralling. One, the 1970 Patents Act and the other, the Drug Prices Control Order (DPCO) 1978. The former did so by making process patents valid in India for pharmaceuticals. This dramatically brought down the prices, facilitating local bulk drug manufacture at costs one-tenths of international drug companies. The second policy intervention, the DPCO, 1978, with all its administrative limitations, put a damper on runaway prices. Subsequently drug companies, national and multinational, had their way, and have succeeded in persuading the government to reduce the basket of price controlled drugs from 347 in 1979 to 76 in 1995. The third major potential policy intervention, the Hathi Committee Report (1975), was never really implemented except perhaps for the DPCO and was generally consigned to shelves.

One of the contentions has been a fair amount of confusion as to what are reasonable prices, reasonable profit, and with drug companies even obfuscating on the costs involved.

Here we show that the same drug is available for a range of prices in the market. The lowest prices at which drug companies sell, apart from exports, are at the prices quoted in tender/contract to government departments and the like. A little higher are prices of generic drugs available (normally) through the wholesale traders who probably get a median commission of 5 per cent from the manufacturers, and a significant part of this sale is to private practitioners and GPs. Further higher priced are the generic drugs sold through some combination of C and F agents, stockists, retailers and medical representatives. The highest priced are brand-named drugs (also called patented medicines, or funnily, ethicals).

Firstly a bit of digression on the quality of data of generic drug prices of government supply. It is generally the case government departments, public sector companies, railways, and other major bulk purchasers, are cagey about revealing the final prices at which tender contracts are awarded. In most cases it is made out to be secret and confidential. The reason for this secrecy is the usual murky story of kickbacks, manipulations, collusion of supplier and the purchaser.

Somewhat of an exception to the (rule and this from personal experience of this writer) is the Tamil Nadu Medical Services Corporation (TNMSC), the sole purchaser for the Tamil Nadu state government health institutions. The TNMSC, for the last few years, has cleaned up its act so much so that information on who has bid which drug at what price is made available to all other bidders at the time of opening of the tenders; eventually the rates of lowest bidders are made public and now put on the web at www.tnmsc.com. There are also advance checks on the manufacturers even as quality checks take place after supply. (For more on TNMSC, see: R Poornalingam, 'Drug Management in the Government Sector: The Tamil Nadu Model', *Essential Drugs Monitor*, No 21, 1996:10 ff.)

Manipulating Quality

What does quality of drugs mean to the consumer? How is bad quality promoted? A drug should act for what it is prescribed. Thus aspirin bought for say, relief from headache should actually do so. We shall assume that the diagnosis of the doctor is correct. When one stores the drug in a cool, dark place, as many medicines are supposed to be, it should still be effective when one has a headache the next time around. The aspirin should not disintegrate as it is wont to if it is not made properly. Aspirin absorbs water (is hygroscopic) and can turn into powder if not stored properly.

All drugs have a declared shelf life between 18 months to five years. A consumer has a right to expect that a well-manufactured drug is effective for the period of its shelf life. Also during this period, when it says 500 mg on the label it should continue to have 500 mg or near that amount during its shelf life. The drug should easily dissolve in the blood stream (within 15 minutes for an uncoated tablet and within 60 minutes for a coated tablet) should not be too hard or too brittle; should not develop fungus or any kind of spots or get chipped (become friable) at the edges or broken by normal handling. Similarly a syrup, IV fluid or injection should not have any foreign particles floating in it or develop fungus or any other chemical reaction with its other constituents or with its container.

A manufacturer ensures quality by taking several steps as perceived by the consumer. In addition, manufacturers are expected to test for several chemical, physical, biological and other parameters including factors like appearance or smell. Acceptable standards are prescribed for all these in Indian Pharmacopoeia (IP) or British Pharmacopoeia (BP) or USP or pharmacopoeias of Europe, the WHO, etc. A drug manufactured as per IP is expected to follow standards prescribed in IP. These standards are checked for each and every raw material and excipients like binding agents that go into the making of a drug. Additionally, tests are carried out for disintegration, weight variation, friability, hardness, etc, during the process of manufacture, say every 15 minutes, and finally from a suitable sample of the entire batch after manufacture.

In addition to ensure that the drug 'behaves' during its life time there are ways of measuring and predicting stability of the drug. And most obviously, as a part of post-marketing drug surveillance, samples need to be picked from the market and tested for quality.

Unacceptable quality of a drug, and therefore liable to be rejected by manufacturers, is when any one of the, say, 25 parameters that define the quality of a drug – its principal constituent and its excipients included – does not meet the accepted standards as specified in the respective pharmacopoeia. Quality of a drug is also defined by the mode of packaging and the material used (glossy and attractive packaging is not always good quality).

In addition a whole set of practices called Good Manufacturing Practices (GMP), are recommended for putting into practice that

ensure quality of drugs. GMP is largely common sense, cleanliness and hygiene and some systematic documentation to ensure the same. Again, this does not always mean air conditioning in every room or dressing and behaving at every stage like an astronaut handling germs from Mars. Quality comes with an attached cost. However it is not very costly to be quality conscious. Quality, like honesty, in the final analysis is an attitude of mind.

How is Bad Quality Promoted?

There are a variety of ways substandard, sub-therapeutic and spurious drugs get promoted in the market. These are some of the ways: (1) By ignoring basic manufacturing requirements as indicated above, that is negligence, poor ethics and a 'chalta hai' (will-do) attitude. (2) By making drugs at the lower end of the tolerance limit allowed: A 500 mg paracetamol tablet would be passed in quality control if it has the active ingre-

Table 1: A Comparison of Tender Rates and Retail Market rates

dient between 450 to 550 mg (± 10 per cent). During its shelf life the 450 mg tablet's potency may decrease and may not act as desired. (3) By inappropriate packing: for instance, water absorbing drugs like aspirin and ethambutol should be protected from high humidity during manufacture and storage during the entire life of the drug. (4) By committing criminal acts like putting 'haldi' powder (turmeric) for tetracycline or sugar pill for calcium lactate. They harm the patients by not acting at the time of need. Again careless manufacture in specially IV fluids and injections have been known to kill. (5) By consciously putting unnecessary products in the market and claiming undue benefits for them. (This can happen with essential drugs also when companies claim benefits not warranted by scientific research). Some addictive substances like alcohol may be added in tonics, and the tonic as a whole is then claimed to be a stimulant. Or promoting substances that are sedatives but have the side-effect of increasing appetite; the drug is then marketed as an appetite stimulant. (6) By trying to bribe drug authority and other officials, and succeeding in evading compliance of desirable manufacturing practices. Also trying to induce doctors to prescribe one's own products, by influencing medical college departments for favourable research reports, by denying the efficacy of cheaper and safer alternatives, bad quality is ultimately promoted in the system. Everybody loses in the process. (7) By trying to come into the market for short-term purposes only: say, merely to fulfill an export order or a government order of, say, Rs 10 crore. This can be done by loan licence manufacture and then disappearing (the so-called fly-by-night syndrome). Every manufacturer has an obligation to disclose sources and uses of funds, balance sheets, details about promoters and who is behind the company. In short, manufacturers need to be accountable to the public.

Over-Price Index

Columns (2) and (3) in Table 1 give the lowest tender rates quoted in the TNMSC tender of 1998-99 that was finalised around August 1998. All TNMSC tender rates are for strip/blister packs. Columns (5) and (6) give the retail market price of an equivalent formulation, also in blister/strip packs, as given in the October 1998 issue of the *Monthly Index of Medical Specialities* (*MIMS*, India). Column (7) is the ratio of the retail price to the lowest tender price.

Column (7) thus is an indication of the extent of over-pricing. Admittedly, tender prices are for bulk quantities whereas retail market prices of drugs include marketing costs, commissions to the retailer-wholesaler network, etc. But nobody sells, especially for transparent government tender and purchase systems, at a loss. So tender rates quoted are the viable prices with absolutely minimal post-manufacturing markups, say from 0.5 to 5 per cent. We argue therefore that the ratio in column (7), we choose to call it the over-price index, is a good indicator of over-pricedness of a product. Simply put albendazole – effective against certain types of worms – or rather its leading branded versions in the retail market, sell at 52.65 times, or 5265 per cent, over the tender price quoted.

We need to draw the line between reasonable markups and over-pricedness. Assuming a very liberal 250 per cent post-manufacturing markup as reasonable, we see only 20 per cent of the 60-odd products examined fall in this category. The second category of over-price index, 2.5 to 5, amount to another 40 per cent while yet another 50 per cent of the products examined have a ratio of 5 and above. The top category is of course occupied by the likes of albendazole, bisacodyl, alprazolam, diazepam, etc. Generally psychotropic products tend to be over-priced as also products for cardiac conditions and hypertension (high BP). Iron-folic acid, a most important drug for the bulk of Indian women and children suffering from iron deficiency anaemia, is tragically not only over-priced, but is practically impossible to get as plain iron-folic acid tablets in the retail pharmacy. The product of Smith Kline compared here is Fesovit spansule, the nearest equivalent, which is unfortunately capsuled instead of being tabletted – the latter would have lowered the price somewhat. Likewise, one would be hard put to find simple, folic acid (tablets and syrup) or say ferrous sulphate (iron tablets and syrup) – they generally come in fancy and irrational multi-ingredient combinations; some of the so-called iron syrups, not analysed here, are horribly over-priced and irrational (for instance, Dexorange).

A caveat about albendazole. The drug company, Cadilla, manufactures the basic drug, so it may be argued that Cadilla is able to quote a rock-bottom price for the formulation. The next lowest quotations for albendazole in the TNMSC tender of 1998-99 are as under: Rs 62 (Veco Pharma); Rs 72 (Atra Pharmaceuticals); Rs 73 (21st Century Pharmaceuticals); Rs 73.88 (Hindustan Tablets), etc. Therefore one would argue that these are more reasonable tender prices from pure formulators, i e, companies which are not also manufacturers of the basic drug. Costing data of LOCOST, a not-for-profit trust and formulations manufacturer, tends to support that around Rs 70 per 100 tablets (strip or blister pack) of albendazole (400 mg) is a reasonable tender price. So the over-price index should be around 15, which is still absurdly high.

Table 2: Comparison of Prices of Drugs Marketed by Glaxo in India and Sri Lanka

(in Sri Lankan Rs)

Brand	Indian Price	Sri Lankan Price	Price* Increase (Per Cent)
G BETNASOL N (GLAXO) 5 ml	13.77	173.75	1261
G EMENEO (ALLERGAN)	59.91	158.98	265
G LIQUIFILM TEARS (ALLERGAN)	29.16	197.07	675.8
O C ZOVIRAX	64.8	204.00	319
G PRED FORTE (ALLERGAN) 3 ml	61.80	694.75	1072
G CELESTONE 10 tabs	2.86	208.40	1200
G BETAGEN (ALLERGAN)	64.8	314.90	462
G COMPLAN CHOCOLATE 450 gm	181.44	346.50	190
VENTOLIN INHALER 100 mcg (200 dose)	110.16	368.00	334
VENTOLIN RESPIRATOR SOL 10 ml	25.92	135.00	520
VENTOLIN INJECTION 1 ml AMP	5.67	81.30	1433
VENTOLIN INJECTION 5* ml AMP	5.67	406.50	7100

ZOVIRAX TABLETS 200 mg 5s	124.00	460.00	369

Note: * Sri Lankan market retail price/Indian market price in SLR × 100.
Percentage price in SLR conversion rate: One Indian Rupee = 1.62 SLR.

Source: *The Island*, February 8, 1999, quoted in the e-drug conference communication, <e-drug@usa healthnet.org>, of February 15, 1999, on Sri Lankan Drug Pricing.

Let us look at the other products in the over-10 over-price index category (over-price index in parentheses):

Diazepam (30.33) is a much misused and sought after sleeping tablet. Amylodipine (16.32) is used in cardiac conditions. Vitamin B-complex (15.64) is an irrational drug by itself with its nearest equivalent, Becosules, being one of the top 10 selling products in the country. Propranolol (15.21) is used for irregular heartbeats; nifedipine (14.70) used in coronary care is also over-priced because the branded product is capsulated; while atenolol (12.81) is also used for cardiac care and hypertension. Not surprisingly, drugs for most of these socially perceived diseases of the affluent. tend to be priced higher.

Some other over-10 over-price index products are: diclofenac sodium (12.62), an anti-inflammatory drug often misused as a pain-killer; calcium lactate (10.76) a most necessary nutritional supplement often not available as single ingredient at reasonable prices; and amitryptyline (10.69), an antidepressant. Even oral rehydration salt (ORS) has an over-price index of 6.19.

Some Questions

The vast differences in pricing – or if you want to call it differential pricing strategies – raise several questions.

Firstly, is it ethical for industry to market drugs at such vastly different prices? Is the government justified in allowing such vast differences to prevail? What is the real cost of manufacture? What is the real cost of marketing? Assuming government supply prices are the lowest, they set a benchmark from which legitimate profits can be calculated. What ought to be then the legitimate markup? It obviously means companies operate at vastly different efficiencies. Is it justified to take as benchmark the prices of larger, less efficient companies for, say, price control by the National Pharmaceutical Pricing Authority (NPPA)?

It is clear that free market principles operate in segments. There is perhaps true competition in (transparent) government tender systems. For the rest, drug prices are what the markets and market segments can take, with some making a virtue of a higher priced brand-named drug as somehow better than a lesser priced drug, brand or generic. In the latter case, the market 'signals' are unpredictable: drug industry along with medical profession can fool a great many people much of the time. An interdisciplinary cartel if ever there was one. Witness for example, that various IV fluid packs like dextrose were sold a couple of years back by IV fluid manufacturers to wholesalers at around Rs 5 per unit and by the time retailers offloaded them on patients it would become Rs 30 and more. The lately revised ceiling of Rs 22 fixed by NPPA (current manufacturers price around Rs 7.50 for 540 ml packs) is a bit of relief though not much for the consumer whose doctor insists on putting the patient on IVs at the slightest pretext.

A second outstanding example is the vast differential pricing of albendazole: Rs 0.22 (government tender); Rs 1 (not-for-profit drug manufacturer); Rs 10 (retail market).

A Sri Lankan Aside

If this is one type of over-pricing, let us recollect another. It is well known that the same drug company will sell its own products at vastly different prices in a foreign market. Glaxo's Zantac (ranitidine) is one notorious example which sells at vastly different prices in the US, Pakistan, India and Indonesia. For instance, in 1995, a strip of 10 300 mg tablets of Zantac in Pakistan was selling at Indian Rs 260.40, in the US at Rs 1,050.70, and in UK at Rs 484.42 while equivalent Indian brands like Torrent's Ranitin were selling at Rs 18.53. Even in terms of purchasing power parity, these differentials do not make sense. Surely US $ 30.02 (equal to Indian Rs 1,050.70 in 1995) could buy more in the US in 1995 than what one could in India with Rs 18.53.

To further illustrate this closer home, a recent front page article in the Sri Lankan newspaper, *The Island*, of February 8, 1999, tried to show how drugs manufactured by Glaxo (India) are sold in Sri Lanka by Glaxo Wellcome Ceylon at prices over 7000 per cent higher. Table 2 gives some details. The table compares the Indian market price of drugs produced by Glaxo, converted to Sri Lankan rupees (SLR) with retail price of these drugs sold by Glaxo Wellcome Ceylon.

It was the article in *The Island* of December 13, 1998 by C R Siemon, a leading eye-surgeon, that had roused curiosity and raised the important question about the difference in drug prices in Sri Lanka and India. Siemon in his article had compared the Sri Lankan prices and the Indian market prices of some drugs and it was clear that the local prices of drugs sold by Glaxo Wellcome Ceylon were exorbitantly high when compared to the Indian market prices.

> C R Siemon when contacted said that he had highlighted high prices of vital drugs because the patients found it difficult to buy these drugs at these prices. "It costs a patient around Rs 500 a day for medicines which many cannot afford. It is my duty as a doctor to ensure that patients can afford the drugs I prescribe them to buy". he said. Glaxo Wellcome Ceylon has yet to respond to the charges levelled against them in his article. Weerasuriya, Professor of Pharmacology also wrote in connection with the article by Siemon. When contacted he asked "Why has Glaxo not responded. I am awaiting a response from them". However, when the Marketing Director of Glaxo Wellcome Ceylon was contacted by *The Island* and asked to comment on the vast difference in prices of drugs sold in India and Sri Lanka, said "No comments".
>
> "Glaxo Wellcome are manufacturing the same drugs in India and selling them at a lower price in India. They are preventing us from buying these drugs from the Indian domestic market at a lower rate" alleged an official of the State Pharmaceutical Corporation (SPC).
>
> One official posed the question: "Most of the drugs that are used in local hospitals are Indian drugs, if the quality is inferior how are patients cured?" Therefore it is evident according to them that there is no difference in the drugs that Glaxo Wellcome are manufacturing in India and the drugs they are marketing in Sri Lanka.
>
> An official also said that most multinational companies are based in India because costs are low in this part of the world.
>
> (Quoted in e-drug conference, op cit. Original source: *The Island*).

What Can We Learn?

What is the moral of this story? What can we learn from all this? It depends. If you are a free marketwallah, you may clamour for more free market, 'opening' up, etc. But we have seen, competition is effective only in the limited case of transparent government tendering and supply. In the retail and wholesale market, the same drug can be available at a range of prices. And if you believe a costlier paracetamol is more effective than a cheaper one, you have freedom to 'choose'.

The Sri Lankan example, if anything, illustrates the prevalent price distortions across the developing world, and how lack of political will on the part of the national government can easily let matters worsen. An ominous portent of things to come once India has exclusive marketing rights (EMRs) and patents and compulsory licensing in place. Globalisation does not seem to discipline companies into selling at even reasonably comparable prices in neighbouring countries.

As far as India is concerned, another way of looking at this is: Use the prices of transparent government drug supplies as the benchmark of lowest possible prices. Use these prices to fix upper limits on reasonable profits. An upper limit for drug prices is a must to make health care affordable. And do not listen to the scare-mongers. Foreign companies never ran away from Bangladesh for the last 17

years when price control has been in force (in addition to a policy of no brand names and a restricted list of drugs). A level playing field, one would think, where one player is the consumer.

Pricing and AIDS-like Diseases

Since nobody nowadays takes home-grown advice seriously, let us end this discussion by quoting a 'phoren' source, to wit. AIDS activist David Scondras, who is also a political and public-policy expert, from Boston, US (quoted by Richard Laing in the e-drug conference, <e-drug@usa.healthnet.org>, Feb 8, 1999. The full original piece of Scondras is posted at <treatment-access@hivnet.in>):

> On an average, drugs manufactured in India are between 1,000 and 4,000 per cent cheaper than the same product in US pharmacies. Drug companies have pushed hard to stop India and other poor countries from making cheap copies of their life-saving medicines by including the curtailment of these practices in the international trade agreement, the GATT [see "GATT and the Gap: How to Save Lives," AIDS TREATMENT NEWS # 307, November 20, 1998]. By pushing for such international agreements on trade, public agencies and our government become accomplices to stopping medicines from reaching the poor.
>
> The costs of medicine depends on who makes it and where it is made. At the Taj Mahal hotel in Mumbai (Bombay), you can buy Hytrin, a sophisticated antihypertensive, for seven cents a tablet. A month's supply of the drug costs about $ 4.20. At a local pharmacy in Boston, the same drug from the same company costs $ 44 48, more than 10 times as expensive. And the Indian price is marked up on the order of 200 per cent.
>
> In Boston, ranitidine (the generic equivalent of Zantac, an H-2 blocker which helps you not make stomach acid) costs 42 cents for 150 mg. The same exact product at Taj costs less than 2 cents (1.79 cents). In other words, even the cheap, generic equivalent in the US is a mere 2246 per cent more expensive!
>
> In fact, most drug, including antiretrovirals, are very inexpensive to manufacture. Their prices reflect what the market will bear, not what they cost to produce. U.S. pharmaceutical firms buy the basic ingredients to antivirals in bulk from other countries at incredibly inexpensive rates.
>
> For example AZT (zidovudine) in bulk can be purchased as of December 1998 for 42 cents for 300 mg from the worldwide suppliers; this price reflects not only the profits to the manufacturer but also to the middleman bulk buyer. This drug is retailed at $ 5.82 at my local (CVS) pharmacy. This means that tableting, packaging, marketing and transporting of the medicine, plus profit, adds 1285 per cent to the basic price, already excessive. This ridiculous price cannot be justified except in terms of what the market will bear, as it bears no real relation to cost of production. An Indian company, Cipla, based in Mumbai, sells AZT in capsule form for $1.42 per 300 milligrams, and according to local experts, Cipla is accruing 2-3 hundred per cent profit margins with the drug. Yet they are selling it at less than a quarter of the price in the US!
>
> ...To provide antiretrovirals to the world, there would have to be a paradigm shift in our collective decision-making processes. There are choices. All of them are in the arena of public policy, not medical research. Under the present paradigm, governments have to either pay for extremely expensive drugs at very high prices and distribute them to the South (developing countries), ignore the 95 per cent of the world that cannot afford these costs, or take actions that would bring down the costs of the drugs. And before the creativity that might solve this public policy dilemma can be unleashed there would have to be an underlying shift in will _ a paradigm shift in which saving the developing world from unnecessary illness and death becomes a priority over short-term economic gains. Thus far, each alternative has been politically too costly. There are efforts being made but they are far too small even conceptually to put an end to a world of untreated disease.
>
> Treatable AIDS-related illnesses will not end until medicine is made available to everyone who needs it. And this requires an imaginative reshaping of the political and economic decision-making paradigm primarily a reshaping that moves us away from a system which defines values in terms of short term gains and takes a longer view of self interest. For in the end, a world full of disease is bad for business.
>
> ....data now suggests that certain old antiretrovirals used together can be as powerful as the famous pretties-inhibitor-based drug cocktails. Had we known this when they were first approved by the (US) FDA, we could have saved many lives. But the drugs were made by different companies and competition between them made it financially difficult for them to test their products together. Who would be liable for any problems? How would company secrets be kept? Who would benefit if the combination proved successful? Who would pay for it? These questions discourage collaborations between companies. The obvious long-term scientific benefits are overshadowed by the key question of short-term financial benefit to the stockholders of the companies involved.
>
> Interestingly, an effort was made in the midst of the HI epidemic to form a collaboration of private companies. It still exists, known by its acronym, the ICC (Inter-Company Collaboration for AIDS Drug Development), and it is trying to undertake joint efforts. Unfortunately, it has tended to prove the difficulty of making this research system work. Its very failure, in efforts that have been without question supported at the highest levels of each company, underlines the difficulty inherent in collaborative efforts between competitors in a market-driven context.
>
> ...We have engendered a culture that increasingly values nothing but money and its accumulation nothing but money and its accumulation. Our public actions increasingly serve the money-making activities instead of controlling and balancing them with regulations and investments in the public interest. So the use of old drugs in combination to control HI was not developed. The private sector did not look at the combination because there was no likelihood of immediate financial return to a specific company and there were serious legal, marketing, and other problems in cross-company collaboration.
>
> The only other actor that could have checked out the combination was the federal government. But there was no agency empowered to find a cure to HI – to cut the red tape, to put in place strategic plans, to force collaboration or to follow anything but academic whims and hunches that make up the basis of the efforts of the only US agency directly empowered to find answers: the National Institutes of Health. As a result many thousands of people have died and thousands more have used up the effectiveness of these drugs in the less useful context of sequential monotherapies. Who knows how many mothers, fathers, sisters and brothers of the rest of the world have died at the hand of this new god.
>
> It is often pointed out that at the time 'we did not know better'. However, had our decision to stop HIV followed a strategic plan analogous to our effort to put someone on the moon, there is no question but that the value of using drugs in plausible combinations would have been investigated immediately. Instead, we allowed the 'private sector' to dictate the agenda. The profit motive has been a critical part of getting treatments developed. Without it, much of the effort to locate compounds with antiviral potential might not have happened so quickly. But, like all motives, it has shortcomings. To not admit this and compensate for them in a coherent, effective way is to burden the world unnecessarily.
>
> The two worlds of North and South are under one god and they suffer from the limitations of that god. These result from the sociological shift from the researcher as searcher of truth and the doctor as bringer of medicine, to the researcher as part of drug development and the doctor as part of the drug sale force. Most importantly, both reflect the role governments have chosen: to facilitate the needs of the invisible hand that has reached the status of a god, rather than analyse what the public needs, and temper the god to serve our common interests.

[The author wishes to thank T Srikrishna for going over an earlier draft of the paper.]

Raising Agricultural Productivity in Gujarat

Bhupat M Desai
Anil C Shah
Prakash M Shingi

Agricultural production and productivity have experienced a declining trend in Gujarat. A workshop on this subject in Ahmedabad last year yielded recommendations on specific themes with the policy paradigm shifts required for each of them.

THE Indian Society of Agri-business Management, Ahmedabad, and Development Support Centre, Ahmedabad, an NGO, organised on August 6, 1998 a brain-storming workshop at the Indian Institute of Management, Ahmedabad, to identify recommendations for raising agricultural productivity in Gujarat. This problem was selected because both agricultural productivity and production have a declining trend in Gujarat as in India. The workshop was innovative in that it envisaged discussion on the observations of panelists that consisted of farmers, agricultural scientists and farm input managers. The participants also included government officials, academicians, NGOs, and farm input and credit agency representatives. Prior to the workshop, two papers both in English and Gujarati were circulated to these participants. These two papers were 'Developing Agriculture in Gujarat' by Bhupat M Desai and N V Namboodiri (*Economic and Political Weekly*, March 29, 1997) and 'Wheat Seed Research and Farmers' by Anil C Shah.

The recommendations that followed from the workshop centre around the following seven themes with policy paradigm shifts required for each of them.

(1) Agricultural 'Strategy' for Raising Productivity, (2) Agricultural Research and Extension System Policy, (3) Seeds Policy, (4) Policies for 'Complementary' Farm Inputs and Resources, (5) Land Consolidation and Tenancy Policies, (6) Government Expenditure Policy for Agriculture, and (7) 'Organisational Strategy' for 'Local' Action.

Agricultural 'Strategy' for Raising Productivity

The 'strategy' for raising agricultural productivity must be technical change (i e, scientific knowledge-based farming) that is both seed and 'complementary' farm inputs and resources-based rather than only seed or only resource-based. Such a 'strategy' follows from three factors, namely,

(a) higher yields per hectare are achieved by the farmers who practise scientific agronomic practices, besides using new inputs and 'complementary' resources in which new technology is embodied; (b) growth in per hectare yield is constrained due to gap in farmers' and scientists' knowledge about new technology; and (c) this yield-based growth is also constrained when access to 'complementary' farm resources is limited.
This 'strategy' is consistent with the farming systems approach that emphasises farmers' all resources and all enterprises such as crops and livestock-farming.

Agricultural Research and Extension System Policy

Recommendations pertain to government investment/expenditure, reorganisation of this system, and manpower underlying it.

While government expenditure on both agricultural research (R and D) and extension must be significantly stepped up, priority be accorded to the latter in the short-run to bridge the gap in the knowledge of farmers and scientists.

But both agricultural research and extension must proactively become farmer-friendly and farmer-partnership-oriented.

Agricultural research so reorganised should conduct that research which provides solutions to farmers' location specific problems. These problems, for example, for major crops/varieties in Gujarat require research on response of per hectare yield to

(a) various soil and moisture regimes, besides water stress, (b) furrow as against complete field ploughing, (c) plant population, (d) transplanting as against broadcasting method of sowing, and that of application of other inputs, (e) type and dosages of nutrients required under different soil and moisture regimes, (f) fertilisers plus compost manure (and just not farm yard manure), (g) hand weeding as against inter-culture, (h) different varieties under major soil and moisture typologies, (i) crop rotation, and (j) inter-cropping
Three other areas requiring attention are (i) evolving location-specific new varieties that are drought, pest and duration-sensitive, (ii) reducing the time taken in this research, and (iii) introducing on-farm testing trials on farmers' fields.

Agricultural extension that is farmer-friendly and collaborative also should provide solutions to farmers' problems. This should be done by changing content, medium, and manpower of extension service. The content of this service must flow on the above stated, 13 problem-areas of research, besides the selection of varieties and 'complementary' farm inputs and resources application. The medium of this service could be farmer-to-farmer contact, VLW to farmer contact, demonstration trials, visits to research farms, audio-visual vans, and mass media like leaflets, (local) newspapers, and television. Extension manpower needs upgradation in its training, status, and farmers to extension worker ratio which at all-India level is about 800/1,000 to make extension services geographically more broad-based and quality-oriented. Furthermore, link between extension service and scientists being very weak farmers' representatives must have a direct link with the scientists.

Seeds Policy

Recommendations pertain to government expenditure, regulation, and reorganisation of seed industry.

Seed industry in both public and private sectors must also be farmer-friendly. In crops like groundnut and cotton, this industry needs to be promoted urgently. Government expenditure on public sector seed industry must be stepped up to enhance its capacity and quality of services. Timely, adequate, and quality seeds availability being the hallmark of any seed organisation, both public and private sectors in this industry must be made more accountable to an independent regulatory agency. Furthermore, certification and testing for quality by this agency must be mandatory for the private sector also. Yet another policy required is to prescribe maximum retail price of seed. The former is because of adulteration that seems to be quite rampant. And the latter is because at present the price of seeds for the same variety in some crops from the private sector is five times or so the price of the public sector seeds. Lastly, all seed organisations must promote knowledge about use of seeds including replacement rates as an input rather than exclusively concentrating on sale of larger quantity of seeds.

Policies for 'Complementary' Farm Inputs and Resources

Although the panel-based discussion was organised for only two 'complementary' inputs of irrigation-water and fertilisers, the panelists as well as participants made observations on other 'complementary' resources such as farm yard and compost manures, bio-agents, watersheds, pesticides, electricity and farm implements and equipments like drip, sprinkler, and improved small implements (such as seed-cum-fertiliser drill). Recommendations are presented separately for irrigation and watersheds, fertilisers, organic nutrients and pesticides, and electricity and farm implements. These recommendations relate to government expenditure, reorganisation of agencies, regulation by these agencies, and pricing of these inputs.

Irrigation and Watersheds: Government expenditures on both of these must be significantly stepped up, besides accelerating the efforts to complete Sardar Sarovar Project. Some of these public expenditures must be on modernisation of the existing canal irrigation projects to alleviate problems of water-logging, soil salinity, etc. These public expenditures will crowd-in private (i e, farmers') investments which may be financed by the rural credit institutions. These institutions may also promote credit in areas where watersheds are completed to further develop land and other associated benefits. NGOs and relevant government departments may also be associated for this.

On reorganisation of the agencies the first recommendation is that they should all be more farmer-friendly and collaborative with farmers' involvement in both design and implementation of the projects. Secondly, the farmers' organisations may also collect irrigation dues, betterment levy, etc. These funds should remain with the irrigation authorities to assist them to improve their O and M tasks, as in Paiticipatory Irrigation Management Projects. Thirdly, irrigation authorities, agricultural departments and extension agencies should improve their co-ordination and interdependency to encourage farmers to adopt more efficient irrigation practices as an input of knowledge. Fourthly, such organisational change is also necessary for reaping the full benefits of watersheds already developed.

On regulatory functions of irrigation authorities the needs are twofold: One of these is updating the data on groundwater potential, and the other is to control the overexploitation of this potential through appropriate both persuasive and coercive measures. Moreover in the command areas of canal irrigated projects conjunctive use of water may also be proactively promoted.

Pricing of irrigation from surface versus groundwater sources lacks parity. Some sort of better parity in pricing may be encouraged through prescribing location-specific maximum retail price for well irrigation and rationalisation of canal water charges. The latter is also required to promote more scientific irrigation practices.

Fertilisers, Organic Nutrients and Pesticides: Four most urgent recommendations on these 'complementary' inputs are: One, the knowledge gap between scientists and input agencies must be bridged. Two, recommendations on the use of these inputs developed by the scientists for different soil-moisture regimes must be transmitted to the farmers through more proactive role of soil testing lab in various talukas to develop more sustainable increases in agricultural productivity. Three, while farmers are keenly aware about fertilisers and pesticides, they need fine tuning of their knowledge on scientific use of these inputs. Both the farm input agencies and extension-workers must proactively fill this knowledge gap considering this as one of the associated inputs. And four, government should encourage mass-based supply of organic and bio-nutrients to complement with fertiliser use. This should be co-ordinated actively with the dairy co-operatives network.

Two related recommendations on fertilisers are on its planning for supplies and pricing. On planning the supplies the demand targets should be more realistic by considering district rather than state-level data as a basis for estimation. On pricing the ad hoc approach to subsidy must be replaced by more sustained approach, besides prescribing location-specific maximum retail prices for de-controlled fertilisers so that more balanced NPK ratio emerges. Pesticides industry should explore aerial spraying when the pest attack is an epidemic, besides promoting use of pesticides on collective basis.

Lastly, government expenditure on rural roads network is necessary not just for integrating the villages with the rest of the state but also for timely delivery of inputs such as seeds, fertilisers, etc. And the credit institutions including co-operative banks must promote working capital credit at reasonable interest rates to the farm input distributors and dealers including village level primary credit co-operatives to accelerate adequate and timely supply of farm inputs.

Electricity and Farm Implements: Farm power sub-sector is critical for Gujarat's agriculture being relatively more dependent on groundwater-based irrigation. Government expenditure on this sub-sector therefore needs to be significantly stepped up. In the short run enhancing supply of electricity requires reducing transmission and distribution losses.

Encouraging sprinkler and drip irrigation by the farmers is essential for water-scarce areas and also for improving water use efficiency. While subsidies for these should be targeted to smaller farmers, institutional credit at reasonable interest rates to farmers must be made more broad-based for such private investments in irrigation.

On smaller but scientific hand and bullock-drawn farm implements such as seed-cum-fertiliser drill government should persuade GSFC, GNFC, IFFCO, etc, to enter into the business of manufacturing such implements since specialising in agriculture related diversification may be more beneficial than diversification in unrelated business products. Such implements improve farm input use efficiency.

Land Consolidation and Tenancy Policies

Consolidating fragments of land which are on the rise due to sub-division and population pressure must be accorded high priority for it would make investment and technology adoption more feasible, besides turning small-scale farming viable in general. State like Punjab, Haryana and more recently Maharashtra where this policy has been successful may be consulted to evolve policy suitable to the state. NGOs should also be associated with the implementation of this policy.

Legalising tenant cultivated farming should also be pursued as it would provide more enabling environment for raising agricultural productivity. Some guidelines for regulating minimum period of lease, eviction at will, etc, may, however, be necessary from the government

Government Expenditure Policy for Agriculture

What follows from the preceding discussion is that the government expenditure in agriculture must be aggressively stepped up. The sub-sectors identified for this are:

(a) Agricultural research and extension, (b) seeds industry, (c) irrigation and watersheds, (d) farm electricity, (e) rural roads, (f) selective farm input subsidies such as for fertilisers and micro-irrigation, and (g) equity support for co-operative credit institutions and RRBs.

Government expenditure on agriculture research and extentsion is presently used more on paying salaries with very little budget for research. This must be corrected by both rationalisation and increases in this budget. The latter is also because it

never formed 2 per cent of agricultural GDP that is internationally recommended.

Government expenditure for agricultural education and poverty programmes like IRDP and JRY must have location-specific sectoral integration such as with agriculture, irrigation and watersheds, rural roads, dairying, fisheries, etc.

These recommendations are also justified by the finding that under the Eighth Plan this expenditure was lower both in terms of allocation and utilisation in relation to total for the plan.

'Organisational Strategy' for 'Local' Action

The 'organisational strategy' for increasing agricultural productivity is that it must be farmer-friendly and farmer-collaborated in all the sub-sectors listed in the recommendations related to 'government expenditure policy for agriculture' above.

Operationalising this strategy also requires ongoing implementation committees at state, district, taluka and village levels. This committee must be represented by all the concerned line departments/agencies in government, agricultural scientists, farm input suppliers, eminent NGOs, and above all farmers.

Wherever such a committee already exists as, for example, in evolving agricultural research on cotton it must meet more frequently, besides aiming at bridging the gap in farmers' and scientists' knowledge on new technologies and alleviating farmers problems that impede raising agricultural productivity.

These committees at various levels must be chaired by an agency implementing agricultural development rather than revenue department.

The basic rationale for such 'organisational strategy' is that the increased government expenditure will *pari passu* have change in its organisation for implementation that is rooted in local action rather than in mere thinking or is state-capital-based.

Missionaries in Medical Care

Rama Baru

Missionary hospitals in India appear to be better distributed in those states which have comparatively good institutional and infrastructural facilities. Given that they are increasingly facing financial and human power constraints, they may have to look more closely at the distribution of their services.

ALLOPATHIC medicine was introduced by the British during the mid-18th century to essentially cater to the needs of their civilian and military population. The medical missions entered the Indian subcontinent during the late 18th century mainly in those regions which were directly British rule. The pioneers of Christian missionary work belonged to both British and American medical missions. The earliest among them was the London Missionary Society which started work in late 18th century in the Madras presidency. Some of the other major groups included the English Baptist Missionary Society and the Arcot Mission which was founded by the Scudders who later established the Christian Medical College at Vellore.

During the mid-19th century, the American Baptist Mission and the American Presbyterian Mission started medical relief work. Prominent among them were John Steele in Madurai, Rev John Newton of the American Presbyterian mission in Punjab and the American Methodist Episcopal Board in Nainital and Pithoragarh in Uttar Pradesh. During the same period zenana missionaries consisting of women doctors set up a number of hospitals for women and children. Women who trained as doctors in the UK and the US had few employment opportunities in their respective countries hence they opted to work in Africa and Asia with the missionaries. The early women missionaries came to India during the late 19th century. Table 1 shows the country of origin and the states where the women set up practice. There was an equal representation of both British and American missionaries who were largely located in the north (Table 1).

Women medical missionaries were largely limited to providing maternity and child health services which they perceived as a major need of Indian women. The efforts of the pioneers led to the establishment of the Lady Dufferin Fund which aided hospitals and dispensaries for women and children in Uttar Pradesh, Madhya Pradesh and West Bengal.

The motivations for doing medical work ranged from providing medical relief to gaining political mileage. As the report of the Christian medical work states,

> Besides being influenced by a need so universally prevalent, and by the need among some purdah women, some missions were led to the selection of a place by an additional motive – some saw in the medical work an aid to winning a way among the hostile tribes of the Frontier and of coming in contact with travellers from the closed lands beyond. [*The Ministry of Healing in India: Handbook of the Christian Medical Association of India*, Weselyan Mission Press, 1932:25-27.]

Apart from these reasons the location of hospitals were also determined by the presence of a large Christian community. Given the size of India and the varied motivations of medical missions, there were regional variations in the distribution of services. Available data on institutions for the late 1930s and 1940s show regional variations in the distribution of services. In 1937, 25 per cent of the mission hospitals were located in the Madras presidency followed by the Bombay presidency which had 13 per cent of the hospitals (Table 2). This trend continued through the 1940s and is seen even to the present day. Between 1937 and 1947 there was a decline in the number of institutions from 246 hospitals to 131. The decline was partly due to the partitioning of the Indian subcontinent whereby parts of Punjab and Bengal became a part of Pakistan and Bangladesh respectively. However this could not explain the sharp decline of institutions in the Madras Presidency from 62 in 1937 to 38 in 1947. The decline between 1937-47 was barely restored by the marginal growth of institutions from 1947-96 with 249 hospitals. This was approximately the figure for the late 1930s.

The reason for the slow and uneven growth of mission hospitals is probably the inadequate financing from the west. Even during the late 19th century, 51.3 per cent of financing in mission hospitals was through self-support, in the form of user fees. The percentage of self-support varied from a high of 68 per cent in Assam to 65 per cent in Bombay to 33 per cent in Punjab (Table 3). The need for self-support arose largely due to reduction of funding from British and American medical missions which were facing a financial crunch following the economic depression of the 1930s and the second world war. The limited foreign aid was earmarked for capital expenditure but most mission hospitals faced tremendous problems in meeting the recurring expenditures. In order to meet recurring expenditures, many of them started introducing user fees as a form of self-support. As the Survey Committee in 1928

observed, "self-support is the goal that every institution conducted by medical missions has had to strive for. Funds from the sending churches have tended to diminish materially in recent years. On the other hand most hospitals have continued to grow in size and expand in their activities to meet the needs that opportunity provided. The additional funds thus required have had to come, in almost all cases, from increased fees" (pp 80-81).

The issue of user fees sparked off a debate within the mission hospital network. Many were of the opinion that by charging fees their charitable work was being undermined since the poorest were being prevented from seeking medical care. The debate among mission hospitals in the late 1920s is extremely pertinent and relevant in the present scenario since many mission hospitals do charge fees in order to keep up with rising costs of medical care and have to compete with the private sector for clientele.

Christian Missionary Work Today

Right from the late 1930s it is evident that there are regional variations in the distribution of mission hospitals and dispensaries. Under the Christian Medical Network which includes several denominations like Protestants, Methodists, etc, the dominant forms of provisioning are hospitals which outnumber dispensaries with a ratio of 3:1. There were 250 hospitals and 37 dispensaries under this network in 1996 (Table 3). Questionnaires were mailed to all member institutions under the Christian Medical Network in order to elicit details regarding date of establishment, bed strength and services offered. On the basis of the responses from different states, the bed strength of these institutions was calculated. There was a differential response rate across states. The percentage of institutions who responded in Gujarat was 60 per cent, 47 per cent in Uttar Pradesh, 40 per cent in Kerala, 39 per cent in Tamil Nadu, 36 per cent in Bihar and for the remaining states it was below 30 per cent (Table 3). Based on the response the bed strength was 7,642. The dominant form of provisioning under this network were hospitals which outnumbered the dispensaries with a ratio of 7:1.

The institutions were unevenly distributed across the country. Kerala had the largest percentage of hospitals (32 per cent) followed by Tamil Nadu with 15.3 per cent and Andhra Pradesh with 12 per cent. 86 per cent of dispensaries were located in Kerala while the remaining states have very few of them (Table 3).

There has not been much growth of Christian medical institutions in recent times. In a recent review, the CMAI has shown that a number of hospitals were closed down between 1947-97 in some states. In Andhra Pradesh more than 50 per cent of the hospitals had closed down while only seven new hospitals had been started. In Gujarat 55 per cent of the hospitals closed down, 25 per cent in Kerala, 42 per cent in Maharashtra, 66 per cent in Orissa, 77 per cent in Punjab, 75 per cent in Rajasthan, 47 per cent in Tamil Nadu, 37 per cent in Uttar Pradesh and 83 per cent in Bengal. Only in Kerala and Tamil Nadu there has been growth of new hospitals. This could well be due to a sizeable Christian population in both these states. In Kerala some Christian and Catholic denominations have also been politically powerful and may have played a role in reviving missionary institutions.

A major reason for closing down hospitals could be due to the financial crunch faced by these institutions because fo cutbacks in funding from foreign churches. There may have also been problems in administration and availability of manpower, specially after the foreign missionaries handed over institutions to Indian missionaries. But these areas need much more detailed research.

There is little published material about the history of the Catholic medical missionaries in India. Interviews with some key persons in the Catholic Hospitals Association revealed that Catholic medical missions started work in Kerala, Bihar, parts of Uttar Pradesh and Rajasthan during the mid-1800s. A recent policy document the Catholic Hospitals Association (CHAI)

states that at the time of independence there were approximately 400 institutions in its network and by 1988 there were 2,500 institutions. These were mainly small hospitals, health centres and dispensaries located in rural areas. The CHAI data on their member reveals that there are 459 hospitals with a bed strength of 23,323 and 1,300 dispensaries with a bed strength of 2,394. Unlike the CMAI, the dominant form of provisioning under the CHAI are the dispensaries which outnumber the hospitals with a ratio of 3:1. As far as distribution of these institutions across states is concerned it is skewed in favour of the southern states, viz. Kerala and Tamil Nadu – 46 per cent of the hospitals are located in Kerala, followed by Tamil Nadu which has 18 per cent of the hospitals. In the case of dispensaries, Tamil Nadu has 22.4 per cent of the dispensaries, followed by Kerala with 16 per cent and Andhra Pradesh with 15 per cent (Table 4). The institutional forms vary in the two networks, CHAI and CMAI. While hospitals dominate the Christian medical network, it is the dispensaries and health centres which predominate in the Catholic missionary network.

The public sector bed strength exceeds that of the private and voluntary sectors put together except in a few states like Kerala, Andhra Pradesh, Tamil Nadu, Maharashtra, Gujarat and Punjab. In order to assess the relative position of the voluntary sector to the private, we have focused on those states which have higher private and voluntary sector growth. The Central Bureau of Health Intelligence provides data on the number of private and voluntary institutions with their bed strength. Since one of the providers of voluntary allopathic services are missionaries, we have tried to estimate their bed strength relative to the private sector. The underreporting of data both in the private and voluntary sectors is well known. Despite these limitations, based on the bed strength of CHAI and CMAI one finds that private bed strength is higher relative to the voluntary sector across all the selected states. Kerala, which has the highest bed strength in the voluntary sector, the ratio of private beds to voluntary is 3:1. In Tamil Nadu this ratio is 2:1 and Andhra Pradesh it is 6:1. However, in Maharashtra and Gujarat where the missionary presence is low, the ratio of private to voluntary beds in 25:1 in the former and 76:1 in the latter (Table 5). Clearly the strength of missionary services relative to both the public and private sector is marginal. However, the trends in distribution of the mission institutions aggravates the regional inequalities between the richer and poorer regions since their activities are restricted to those states which are better developed in terms of institutional and infrastructural inputs.

Given the trends in the characteristics and distribution of missionary hospitals and dispensaries several important issues emerge which need consideration. Firstly, the issue of regional variations in the distribution of institutions needs to be addressed by these networks specially if they want to serve poorer regions where the public sector is weak and the private sector will not want to invest. Secondly, the source and means of financial institutions in these networks is extremely important. This issue had surfaced way back in the late 1920s and was probably an important reason why several hospitals were forced to close down. Many mission hospitals were forced to charge fees which affected their voluntary status and hampered charitable work. Very often it became difficult to make a distinction between private and voluntary services since both provided services at a cost. Here, the respective networks have to debate this issue with their member institutions so that they can evolve some way of ensuring that the poor are not denied care. The identity of voluntary hospitals has been further eroded with increasing privatisation as a result of which they are forced to compete with the growing private sector. This is bound to have an effect on the type of services the voluntary sector will provide. Since the private sector largely provides curative services which are dependent on high technology medical equipment, very often mission hospitals are also doing the same. High technology medical care results in increased costs which then needs to be recovered through user fees. Therefore very often mission hospitals are providing care which is a far cry from rational medical care which was the emphasis during the early part of this century. Lastly, most mission hospitals have a lower recurring expenditure compared to private hospitals because they pay their doctors and specially the paramedics less than other institutions. They draw their paramedics fromn religious orders and hence are expected

to volunteer their time for a good cause. Given the changing scenario, the mission hospitals may increasingly face a situation where many doctors and paramedical workers may not work in these hospitals for low wages specially when the private sector may be willing to pay higher wages. These questions are closely linked to how those who manage and work in mission hospitals perceive their role in the present and the future – what is the space they feel that they can carve for themselves at the present juncture of declining funds, cutback in public funding and increase in private institutions?

[This paper is part of the project submitted to the UNDP entitled 'Regional Variations in Private and Voluntary Health Services: An Interstate Analysis'. I would like to express my sincere thanks to Cherian Thomas and his colleagues at the Christian Medical Association, New Delhi for giving me access to their publications and valuable suggestions.]

The Scheduled Tribes and Christianity in India

S K Chaube

A glance at the census reports on religion will show that the growth rate of the Christian community is the lowest among all the religious communities in India. Another feature is the recent association of Christianity with the scheduled tribes, largely because Christianity happens to constitute religious identity of the overwhelming majority of the tribals in the four north-eastern states of India.

DURING the height of what Surajit Sinha [Sinha 1982] called the 'tribal solidarity movements' in the 1950s and the 1960s, when the movements for tribal states became powerful, the blame for 'unrest' was laid mainly at the door of the Christian missions in India. That Christianity and, its concomitant literacy had a great deal to do with the tribal awakening was demonstrated by Jaipal Singh, Rev J J M Nichols-Roy, Captain Williamson Sangma and a host of other educated, Christian leaders. As a result of such movements a host of hill-states were born in north-east India by 1972. Chaube argued [Chaube 1973] that Christianity had played a progressive and, in fact, integrative role in north-east India within the framework of regional autonomy.

Recognition of the right to statehood for Jharkhand/Vananchal and Chhattisgarh – the two areas with high tribal concentration – in the recent period, one would expect, brings the focus on Christianity again, though in a somewhat distorted way. Neither Jharkhand, nor Chhattisgarh is a tribal-majority area today. The tribal element has been somewhat diluted into a regional character – more in Chhattisgarh than in Jharkhand. Both of them have been sanitised by hindutva activism. Attacks on the Christian priests and churches in the concerned areas, however, betray a nervousness of the powers that be. The Dangs and Jhabua, incidentally, are centres of a movement for a tribal state dominated by the bhils [Verma 1990:74].

Tribal Demography

Tribals in India, as elsewhere, are not a homogeneous group. The 'tribe' in fact, is not even defined properly. In India they are an administrative category. The British, until March 31, 1937, categorised them as 'backward classes'. It was under the Government of India Act, 1935, that they were first scheduled as tribes, a practice that was retained in independent India. This population is spread from east to west, from the Patkoi range on the borders with Myanmar to the Aravalli range, along the Chhotanagpur and the Vindhya mountains, with two southward protrusions into the Orissa-Andhra and the Maharashtra territories.

The scheduled tribes constitute 8 per cent of the Indian population. Two factors have contributed to the rise of the tribal population's share in total population from 5.36 per cent in 1951 to the present figure: (i) the removal of intra-state restrictions by the Scheduled Castes and Scheduled Tribes Orders (Amendment) Act, 1976, and (ii) inclusion of new tribes into the schedule. Removal of inter-state restrictions on recognition of scheduled tribes may further increase their share in the total population [Verma 1990:13-14]. In 13 states the scheduled tribes constitute more than 5 per cent of the total population. They are Andhra Pradesh, Arunachal Pradesh, Assam, Bihar, Gujarat, Maharsashtra, Manipur, Meghalaya, Orissa, Sikkim, Tripura and West Bengal (Table 1). Of these Arunachal Pradesh, Meghalaya, Mizoram and Nagaland are overwhelmingly tribal. Besides, of course, Lakshadweep, which is a union territory.

Besides the removal of area restrictions on the scheduled tribes in a state, four political and economic factors have affected tribal demography:

(1) Two tracts of territory, now constituting Arunachal Pradesh and the Tuensang district of Nagaland, were unadministered till the mid-1950s. No census of these areas was taken in 1951. In 1961 a limited number of census forms with a limited number of questions among the people of NEFA (now Arunachal Pradesh) mostly residing in the foot-hills was circulated. It is doubtful that the people of Tuensang (formerly, Naga Tribal Area) were properly censused though the census report of 1961 is silent on it. The Tuensang area was the hotbed of Phizoite politics.

(2) Communal violence in East Pakistan/Bangladesh since 1947 has brought several tribal people into the north-eastern states of Assam, Meghalaya, Tripura and Mizoram: Garo, Hajong, Khasi, Jaintia, Tripuri, Mizo and, most of all, the huge Chakma refugee population increased the tribal population of these states. Several early Hajong and Chakma groups were settled in Arunachal Pradesh.

(3) Creation of Andhra state in 1953 and the states reorganisations between 1956 and 1972 transferred territories from the former Madras and Hyderabad states to Andhra Pradesh, from Bihar to West Bengal and from Rajasthan to Madhya Pradesh besides splitting the former Bombay state down the middle into Gujarat and Maharashtra and creating four tribal-majority states of Arunachal Pradesh, Meghalaya, Mizoram and Nagaland out of Assam.

(4) Industrialisation of parts of Madhya Pradesh and Orissa led to migration of literate tribal population of the Jharkhand area as unskilled and semi-skilled workers. Such migration was noticed by this writer during a visit to Rourkela in 1976. Some migration seems to have resulted from displacement caused by development across state boundaries.

Statistics can sometimes be misleading. The total population of the four states Arunachal Pradesh, Meghalaya, Mizoram and Nagaland constitute 0.56 per cent of India's population. The total tribal population of these four states is less than the tribal population of West Bengal which constitutes 5.6 per cent of that state's total population. These states enjoy their political status by virtue of their ethnic concentration, isolation and special historical developments.

Since ancient times little cultures all over the world have been either extinguished or swallowed by their neighbouring great civilisations in a way variously described by anthropologists as 'assimilation', 'acculturation', 'sanskritisation' and the like. When placed between two proximal great civilisations, they have played what Roy-Burman (1972) called a 'bridge-buffer role'. Such roles have been played by the tribes in central India more than those in north-east India due to geographical reasons.

The Indian Tribes and Hinduism

Since ancient times Indian tribes have been assimilated into the Hindu society and caste-stati according to their political and economic strengths. The religious integration involved, on the part of the tribes, the adoption of brahminical rituals and gods and, on the part of the host society, the lending of brahminical services [Bose 1949:62-71; 1953:171-91]. Beyond the north-west frontier Islam did not penetrate the tribal societies in India. Only Lakshadweep came under the influence of Islam through contact with the Arab traders.

Contrary to general impression, the advent of Christianity into the tribal territories of India was late. The East India Company did not encourage missionary activities in British India. It was only after the passing of the Charter Act of 1813 that they were forced to allow Christian missions in their territories. Initially, the Christian missions attempted proselytisation of 'gentlemen' and not the 'lower class people'. The did not enter any tribal territory before the administration. Their activities picked up only towards the end of the 19th century. The financial support of the government was directed, officially at least, towards the missions' educational and welfarist activities only. Some government officers detested the missionaries for creating a class of literati that challenged the traditional tribal leadership and disturbed social harmony [Chaube 1973:58-59; McCall 1949]. Even in 1951 only two districts of India had Christian majority - the Lushai (Mizo) and the Naga districts in Assam.

While 'Hindu' is a society within which different religions (faiths and modes of worship) operate, Islam or Christianity is a religion within which different social structures operate. 'Hindwi' (Hindu) is a geographical term first used by India's western neighbours and carried into the early western writings about India. Indologists like Max Muller saw it as a social order defined by the 'varna' system, which upheld brahminical hegemony and within which 'jatis' (castes) had different slots permitting what Bose called "the Hindu method of tribal absorption" [Dumont 1972:61-65; Bose 1953:156-58]. The British census officials ignored the view, adopted caste as peculiar to Hindu religion [Dumont 1972:316] and decided to record as tribals groups, which had not been castised. Having to work with mostly Hindu subordinates, however, the census officials soon ran into problems that have been aptly summarised by Kingsley Davis

> It is hard in practice to draw a line between advanced primitive religions on the one hand and backward Hinduism on the other...Hinduism is so syncretistic that it embraces almost every conceivable religious practice, and the Hindu social order is so pervasive that it infiltrates nearly

Table 1: Scheduled Tribes and Religions in Select States 1991

Mizoram	Part of Assam			83.81	85.73 (70.20)
Nagaland	Part of Assam	52.98	66.46 (78.29)	80.21 (80.28)	87.47 (70.20)
Orissa	0.97	1.15 (41.63)	1.73 (88.48)	1.82 (26 80)	2.10 (38.67)
Rajasthan	0.07	0.11 (100.12)	0.12 (34.09)	0.12 (31.01)	0.11 N
Sikkim	0.22	1.74 (825.33)	NA	2.22 NA	3.30 (91.20)
Tripura	0.82	0.88 (19.98)	1.01 (56.52)	1.21 (56.52)	1.68 (19.96)
West Bengal	0.44	0.59 (12.52)	0.57 (23.09)	0.59 (26.93)	0.56 (19.96)

Notes: N - negligible; NA - not available; figures in brackets indicate decadal percentage growth of the Christian community.

every social group...Nearly always, therefore, there is some remote basis for labelling a primitive tribesman as Hindu, and he, being illiterate, is often incapable of asserting himself in the matter. Moreover, because of the vagueness and inclusiveness of Hinduism, the enumerator tends to regard it as a residual category. Any person in India is thus a Hindu unless he definitely proves that he is something else [Davis 1951:188].

In the days of competitive religious politics inaugurated in the 1920s, enrolling the tribals into any of the major religious denominations, namely, Christian and Hindu, available to the tribals, became a political task of the census staff resulting in a steady decline in the number of the followers of 'other religions and persuasions' (i e, other than Buddhist, Christian, Hindu, Jain and Muslim). Between 1921 and 1951 the population share of the Hindus in India rose from 84.40 per cent to 86.89 per cent (partly due to migrations following the partition in 1947); that of the Christians from 1.79 to 2.35 per cent while the share of 'other religions and persuasions' (ORP) fell from 3.26 per cent to 0.52 per cent.

The Scheduled Tribes and Christianity

The most remarkable point about the Christian population in India is that its share in the total population of India has, over the six years since 1951, fallen. The migration of a section of the small Anglo-Indian community after independence could not have more than a marginal effect. A glance at the census reports on religion will show that the growth rate of the Christian community is the lowest among all the religious communities in India. The Kerala Christians have the minimum growth rate followed by the Goa Christians. The cause has to be found probably in their high literacy and freedom granted to women.

The second point about the Christian population in India is its unmistakable, rather recent, association with the scheduled tribes though not vice versa. Four states in north-east India show this correspondence to a great length. Almost the entire tribal population in Manipur and Nagaland is Christian. An overwhelming majority of the tribals is Mizoram and a large majority in Meghalaya are Christian. About one-fourth of the tribals in Assam and about one-sixth in Arunachal Pradesh are Christian too. However, the figures regarding Sikkim are misleading. The scheduled tribes of Sikkim are almost entirely Buddhist. Buddhism constitutes 27.15 per cent of Sikkim's population, 12.88 per cent of Arunachal Pradesh population and 7.83 per cent of Mizoram's population. Tripura, on the other hand, with about four times the national average of scheduled tribes population, has a Christian proportion of two-thirds the national average. In Tripura, the Buddhists constitute 4.65 per cent of the population – about three times that of the Christians (1.68 per cent). This, partly because of the arrival of the Buddhist Chakma refugees from Bangladesh in the 1980s.

The contrast between Manipur and Tripura, both former princely states in north-east India, in respect of Christianity is a pointer to the politics of religion. Manipur was under British administration during the last decade of the 19th century and the first decade of the 20th century when Christian missions entered those hills around the Imphal valley. The hills remained virtually under British occupation till independence.

In the princely states of India, the Christian missions did not work. So the Christian population in the central Indian tribal settlements was low. Even in the Chhotanagpur area of Bihar, where the British were mainly interested in the forest and mineral resources, after a series of tribal revolts, the government did not find it convenient to encourage Christian missions. Since the 1930s, on the other hand, the Gandhians and the Rashtriya Swayamsevak Sangh became active in the central Indian belt to halt the growth of Christianity among the tribes.

Statewise, between 1951 and 1991, Christian share in the total population has fallen sharply in Andhra Pradesh and Assam, considerably in Tripura and marginally in Bihar, Maharashtra and West Bengal. It has risen sharply in Arunachal Pradesh, Madhya Pradesh, Manipur, Meghalaya, Nagaland, Orissa, Sikkim and, marginally in Rajasthan.

It is easy to get shocked at the fact that in as many as three states of India Christians form the majority, and in two of them an overwhelming majority. But it will be naive to ignore the fact that the total population of these three states constitute 0.45 per cent of India's total population. Even the Christian population of the three states constitutes only 14.71 per cent of India's total Christian population. The mystery lies in the fact that these states were constituted practically by four thinly populated former districts of Assam.

Hazardous Industrial Wastes and Poor Nations

MSS

In December last hazardous toxic waste from a petrochemical company in Taiwan was dumped in Sihanoukville in Cambodia prompting massive protest and eventually action by the state authorities. The events in Cambodia confirm that death by technology has advanced beyond the wildest imagination of any previous era. A positive outcome however has been an increased popular awareness and government's eagerness to avoid public reprisals.

TAIWAN's petrochemical giant Formosa Plastics shipped 3,000 tonnes of 20-year old sludge, packed in cement cakes, and tainted with the highly toxic metal mercury to Cambodia, which arrived in Sihanoukville, the major port in Cambodia, on November 30, 1998. This consignment was described in customs documents as 'construction waste' and was dumped four days later in areas adjacent to an important fresh watershed and in villages near the Ream National Park. The dumping operation was carried out rather casually with the entire town being powdered with waste from up to 100 uncovered trucks that ferried, for a week, the waste to disposal sites. Later, these trucks were cleaned next to fresh water reservoirs and in several locations in and around the town. Many local women collected waste sacks from the dump to use as blankets, roofing and mats. News of the dumping and its seriousness came to light when some of the port loaders reported sick, and at least one person, Pich Sovann, purportedly died due to the inhalation of mercury-contaminated dust. Some villagers also complained of dizziness and nausea after coming into contact with the waste. The timely and massive media exposure of the waste dumped at a single site led to a nationwide upheaval and popular, widespread outrage of such casual jettisoning of poison. These disclosures described the scandal as a multimillion dollar conspiracy of deceit involving Taiwanese businessmen and Cambodian officials.

Initially, Cambodian officials were evasive and did not confirm the details of the waste or its effects, while Formosa denied any wrongdoing with an official of the company claiming that the shipment was legal, safe and non-toxic and that the waste had been handled in accordance with the regulations of the Environmental Protection Administration (EPA). Formosa's waste was certified by EPA as being below hazardous levels and safe for landfill, but the company had not been given approval from the Taiwan administration for shipping to Cambodia. In fact, in early October 1998, the Taiwanese government fined Formosa for attempting to ship the waste to Cambodia without valid documentation. It remains a mystery as to how Formosa was able to obtain clearance thereafter to ship the cement cakes to Cambodia. As the controversy raged, Mok Mareth, Cambodia's minister for environment, entered the debate and claimed that neither he nor his ministry had any knowledge of the shipment and that he had declined many similar requests in the past.

As denials and counter-claims mounted, local people became hysterical, as newspapers, radio talk shows and television spots relayed information and comments on the possible disaster that the waste could create. Tens of thousands of those who could afford to fled the town, and every illness was suspected to have emanated from 'mercury poisoning'. These events sparked outrage which escalated into rioting and panic when dock worker, Pich Sovann mysteriously died after cleaning the hold of the ship that transported the waste. Hundreds of people began marching on the streets of Sihanoukville on December 19 and demonstrations continued for three days. As protests gained momentum and turned violent at least two people were killed and several injured. The protesters were apparently venting fury at officials and businessmen they believed were responsible for allowing the shipment of industrial waste to enter Cambodia. Protests were fuelled by reports that some people were dead and others had fallen ill because of the waste. Prime minister Hun Sen, who recently assumed power after a four-month stalemate on government formation, took swift action and suspended 20 senior customs officials and vowed to take action against everyone involved in the scandal.

Two days later, senior ministers Sar Kheng and Mok Mareth arrived in Sihanoukville to calm fears about the possible dangers of the waste, and more than 150 soldiers donned hi-tech protective suits, rubber boots, gloves and gas masks to begin removing the sludge blocks.

These events resulted in a public outcry in Taiwan also. The Taiwanese government was quick to test the samples and found that mercury levels were slightly above the country's safety standards of 0.2 parts per million. Two separate analyses of the waste have also confirmed that the sludge might be highly toxic. As public pressure mounted, Formosa Plastics apologised for dumping the waste. On January 4, 1999 Lee Chih-tsun president of Formosa, declared that an agreement had been reached with the Cambodian government to remove the waste and have it "re-treated in a developed country". Formosa also reportedly agreed to pay \$10 million in compensation to Cambodia to cover the costs of damage and to treat the land on which it had been dumped, and to refill it. Both Cambodian and Taiwanese governments were keen to settle the issue, primarily to avoid further public protest, as fast as they could and to assure that "all is well and back to normal life". This quick patch solution denied the public any further information on the sludge and its possible impact even after re-export. Rumours were rife that this dumping deal, reportedly worth US \$3 million on the Cambodian side, was one of many done before the 1998 elections by a senior most official of the ruling party and offers of investigation were merely made to placate the public.

GLOBAL CONCERN

The Sihanoukville dumping scandal has continued to attract attention from environmentalists around the world. The *Phnom Penh Post* (January 8, 1999) reported that the Basel Action Network, a group of activists dedicated to banning global waste trafficking have already contacted the ministry of environment with a range of concerns. This group has argued that not enough information is available on the organic content of the waste material, particularly dioxin. Dioxin is targeted for global phase-out in a treaty now being negotiated under the UN environment programme as one of the worst persistent organic pollutants. Unfortunately, neither Cambodia nor Taiwan are signatories of the Basel Convention which forbids trade in hazardous wastes. If they had signed that treaty, it would have been illegal for the waste to have been exported and would have imposed several obligations on the exporting nation.

This controversy takes one back to the Minamata scandal, in Japan, which exposed the horrific effects of mercury poisoning. In 1932, Chisso, a petrochemical firm, began to dump mercury in Minamata bay. In the 1950s fish began dying and then

people, who first became numb, their vision blurred and speech became impaired. It continued to affect a second generation of more than 12,000 people with various deformities and diseases. After a long drawn-out enquiry, the Japanese government ordered Chisso to pay compensation of $1,30,000 to each person affected in 1978, and an additional lump sum settlement of $184 million in 1996.

At Minamata, the carelessness of a rapidly industrialising nation poisoned its own citizens. At Bhopal, a US multinational, Union Carbide, poisoned the people of the south. At Chernobyl, deficient government standards in the former Soviet Union resulted in the leaking of radiation into the atmosphere, poisoning not only Ukraine but lands beyond the Soviet border. In Cambodia's Sihanoukville, a petrochemical giant, connived with poorly paid officials of a developing nation, casually exported toxic waste and dumped it without any concern for environmental standards.

Sihanoukville now joins the long and mounting list of eco-catastrophes which seem never ending. While Minamata replicates development in its most murderous form, the Sihanoukville episode once again illustrates how big firms take advantage of poor nations and weak administrations. As has happened to the people of Bhopal, Formosa a giant organisation with advanced science, technology and production techniques, willingly condemned poor people to fear, sickness and death, and their beautiful bay to irreparable damage. These events tell a salutary tale, that in this fast industrialising world, there is no place for the poor to hide.

Nonetheless, in Minamata, Bhopal, Chernobyl and Sihanoukville there is reason for hope. As protests in Sihanoukville showed, a new resistance is emerging to the logic of growth, transnational companies and elite power. The present system has begun to undermine itself by creating its own contradictions: growth against nature; militarism against the need for collective security and peace; mindless consumerism against humankind aspiring to regain lost values and a meaning to life, ecosystems and livelihood. The concern for the environment and the sensitivity towards nature that it implies is gradually being reflected in the popular media. Such renewed debate on environmental regulations have provided space where the value-premises of modern science can be questioned. The first value premise consists of the idea that industrial development has no moral responsibility for the large mass of population. The second value-premise consists of the idea that economic benefits alone count in modern society.

Transborder pollution and global environmental problems have been on the development agenda for some time. Some analysts argue that when a country's production or consumption decisions impose environmental externalities on other countries, there may be a theoretical case for using trade policy to correct these externalities. As the Bhopal and Sihanoukville incidents have established the arguments for using trade policy to correct environmental externalities are weak and are not sufficient to ensure the safety of the local population. The threat of trade sanctions may not provide for sufficient incentives for countries to abide by multilateral environmental agreements either. The simple fact remains that companies continue to dump industrial waste in other countries merely to avoid domestic environmental standards.

On the other hand, as recent experiences have demonstrated, in the case of transborder pollution, a tariff on polluting goods may not, *per se*, improve welfare. Such imports tend to flow from high-income to low-income countries and from high-population density to low-population density countries. Imports are also more likely to flow from more politically stable to less politically stable countries. In the receiving nations, there is no guarantee that any welfare compensation will be used to mitigate the suffering of the affected population. In all probability, such revenues will be shared among politically influential groups to the detriment of the poor and the environment.

Therefore, if disposal practices in less politically stable, low-income and low-population density countries are less safe than the public would prefer, then more developed countries should be required to impose minimum safe disposal standards, or at the very least, monitor such disposal, observing the Basel Convention and ensuring strict enforcement of the regulations. Without such a commitment from the industrialised nations, the poor and weaker counterparts will continue to suffer, and more Bhopals and Sihanoukvilles are certain to occur.

Decentralised Institutions

Governmental and Voluntary Sector

George Mathew

From the beginning of the 1990s, there seems to be a positive change in the outlook towards decentralised institutions. In the emerging scenarios both panchayats and voluntary agencie, have a crucial role to play and can work together effectively if they view each other as partners rather than contenders in the process of decentralisation and development.

IN this paper, panchayati raj institutions at the three levels – district, block/taluk and village – as well as town municipalities and city corporations, are taken as decentralised institutions of the state and the government. Decentralised institutions in the voluntary sector are the community initiatives which protect people's rights and assets, people's organisations as well as voluntary associations or agencies (VAs) working to improve the socio-economic status of local communities. That is, broadly speaking, citizens' initiatives and their organisations in civil society.

It is at the local level (in villages, towns and wards of corporations) that the majority of people conduct their day-to-day lives. There is face to face interaction with almost everyone in a locality. When the state reaches out to that level, its government comes under closer scrutiny. Here, citizens' groups can interact with the state, even confront it, and demand the local government's support for their own effort to sustain or improve the quality of life of individuals as well as the community.

At the outset, it should be made clear that in terms of numerical strength and operational reach, voluntary agencies (VAs) cannot be compared with panchayati raj institutions (PRIs). In many villages and small towns there are no VAs at work at all. The programmes of recognised VAs rarely cover all districts in a state. Where strong local groups have been set up, for example, for natural resource management such as the joint forest management committees, water users groups, etc, their coverage is restricted to a few hamlets and villages.

In comparison, we have over 2,50,000 village panchayats, 5,000 panchayat samitis at the block/taluk level, and over 500 district level zilla panchayats. Therefore, it should be borne in mind that panchayats as local self-government institutions are everywhere, while voluntary agencies are not.

The Panchayats

Although the Constitution of India has recognised only two tiers of governance in the country – Union and the states – in its Directive Principles of state Policy, the Constitution (Article 40) had mentioned 'units of self-government' to denote panchayats below the district level. In the 50 years after independence practical problems of administration, governance and development along with people's aspirations for sharing power, widening the space for people's organisations and their relevance have underlined the need for the decentralisation of power. This is particularly so for the district level and below.

Decentralisation of institutions and powers, as it stands today, has evolved as the outcome of several developments since 1950. The following need special mention:

(1) The concept of the 'four-pillar state' (*chou-khamba rajya*) – of village, district, state and centre – gaining strength.

(2) The idea of district government gaining currency, especially with the 1983 Karnataka Act on panchayats.

(3) The Amendments to the Constitution (73rd and 74th Amendments of 1992) which defined local bodies at the district and below as 'institutions of self-government'.

These developments had three implications. First, the idea of 'local self-government', hitherto understood in accordance with the government resolution of Lord Ripon (1882), as local bodies carrying out only civic functions, with mainly nominated members, became irrelevant.

Second, panchayats, which were localised institutions with limited scope, assumed the dimensions of 'panchayati raj' with a wider and more dynamic meaning – as part of a political process from gram sabha to Lok Sabha (village assembly to national parliament).

Third, the existing quasi-federal structure began to undergo radical changes affecting centre-state relations as well as state-panchayat relations. In other words, a whole lot of changes are now taking place in this area, with 29 subjects being transferred to panchayats under the Eleventh Schedule of the Constitution. In effect, the concentration of power at any one level of the state is becoming difficult.

'Institutions of self-government' are mentioned in Article 243 G of the Indian Constitution. This concept needs to be interpreted in the light of all these positive developments in the last decade. In fact, nowhere is the term 'institutions of self-government' defined. Therefore, a clear understanding has to evolve through praxis. First of all, it entails autonomy. That is, autonomy within the union and the various tiers of government. The meaning of the concept of autonomy is, however, highly flexible. At a given time, it denotes such space for governance at a particular level as can be negotiated between the concerned parties. But the range of manoeuvrability is within boundaries set by the centre. At the lower end, it must obviously remain to be defined. The states would know what is the very least that they must endow their panchayats with by way of powers and authority for them to be recognised as institutions of self-government.

The full meaning and implication of panchayats and municipalities becoming 'institutions of self-government' after the Constitutional Amendments must be understood in its proper perspective. Although Articles 243 (d), 243 G and 243 P(e) define panchayats and municipalities as 'institutions of self-government', nowhere has the scope of these institutions been defined. But they can, nonetheless, bring about radical changes in India's federal structure with far-reaching consequences. As Nirmal Mukarji wrote immediately after the passing of the Constitutional Amendment: "The amended Constitution requires the states to constitute

panchayats as institutions of self-government not only for villages but also at intermediate and district levels. Consequently, there will, henceforth, be three strata of government: the union, the states and the panchayats. A more radical change is difficult to visualise. Its implications are far-reaching" [Mukarji 1993].

If we take the case of panchayats, all the three tiers – gram panchayat, panchayat samiti and zilla parishad – are institutions of self-government for their respective jurisdictions in respect of functions allotted to them. "They are in a way governments unto themselves for the limited area and for the limited functions ... Panchayats are representative institutions of self-government" [Bandyopadhyay 1997].

The concept of 'self-government', as guaranteed by the Constitution, is not negotiable. The powers and functions of panchayats and municipalities could be divided into two categories: (i) original functions, and (ii) assigned functions. The original function is: "preparation of plans for economic development and social justice". The assigned functions include "implementation of schemes for economic development and social justice as may be entrusted to them including those in relation to the matters in Eleventh Schedule".

There is another view which states that all that happened in 1992-93 was the strengthening of 'administrative federalism' and nothing more. The provisions of the 73rd Amendment strengthen 'administrative federalism' in order to facilitate and encourage delegation of administrative and financial powers from the states to local bodies. Their administrative powers and responsibilities and the financial resources to exercise these powers and discharge these responsibilities are entirely derived from legislation that will have to be passed by the concerned state. They have no definite executive, legislative, financial or judicial powers and, according to this school, merely having constitutional status or regular elections does not confer on them the status of the third tier of governance. S Guhan, an exponent of this view, quoting Daniel Elazar, argues that decentralisation is not a federal characteristic because decentralisation implies the existence of a central authority [Guhan 1995].

Since this school of thought takes a narrow and limited view of the nature and impact of democratic and political processes which have taken place in our political structure, one cannot agree with this argument. It may be stated here that in countries where local bodies exist, they are given powers of delegated legislation, e g, budgets, by-laws and regulations. They also enjoy considerable powers of regulation attached to their functional responsibilities. India is, therefore, definitely moving from administrative federalism to multi-level federalism [Mathew 1997].

For local bodies in India to function as institutions of self-government, there are certain prerequisites. These can be identified as (a) clearly demarcated areas of jurisdiction, (b) adequate power and authority commensurate with responsibilities, (c) necessary human and financia[l] resources to manage their affairs, an[d] (d) functional autonomy within the federa[l] structure. The Constitutional amendment[s] provide for all these.

The Eleventh and Twelfth Schedule[s] added to the Constitution along with th[e] Amendments have suggested transfer o[f] 29 subjects to panchayats and 18 subject[s] to municipalities. State Conformity Act[s] have more or less incorporated them. Whe[n] they are fully operationalised, one can sa[y] that local bodies at the district level an[d] below have genuinely become the thir[d]

tier of governance in the Indian federal structure, giving the Indian federation a new meaning. Of course, these local bodies have no legislative powers; nor do they have law and order (police) powers or judicial powers. Some states have mentioned in their Conformity Acts the creation of local courts (Nyaya Panchayats). Amongst policy makers and intellectuals, there is a section which is of the firm opinion that police and judicial powers must be given to the panchayats.

The bureaucracy for local government is of crucial importance. Whatever may be the interim arrangements, eventually a panchayati raj cadre will become inevitable. What will be its nature/composition? This will have to evolve through the coming years.

An important implication of this development is regarding existing state acts and parastatal bodies. About 53 Central and State Acts would come in conflict with the 73rd and 74th Constitutional Amendments. The parastatals like the electricity boards, water and sewerage boards, public works departments, development corporations, etc, have centralising structures and how they will adjust to the new set-up is a big question. In other words, the role of the state as we understand and experience it will have to undergo a radical transformation.

Community Initiatives

Under the new panchayati raj, there is greater possibility of giving new meaning and content to the concept of civil society. Even when the power of the state, compared to its absolutist historical precedent, is weak, in a civil society, direct initiatives necessary for self-government would be assured by voluntary associations in India at the local levels. Civic order in a liberal society cannot be sustained without the consistent activity of citizens at the grass roots. Civil society is, in a way, an antidote to authoritarian tendencies because the informal pressures of public opinion through the democratic process threaten new tyrannies. Only the plurality and diversity of civil associations can assure the characteristics which reflect good governance.

People's initiatives express themselves in several ways – citizens' groups, neighbourhood organisations, associations to safeguard community interests and culture, pressure groups, voluntary organisations to protect the rights of the people in general and the vulnerable and marginal groups in particular, trade unions, co-operatives, etc. Non-governmental organisations (NGOs) and VAs may have an international, national, regional or local base. They are not location specific. The local organisations/associations are generally community-based organisations (CBOs). There are also associations and societies registered at the district or state level, with a district authority as its chief (like the district blindness control societies, watershed development committees, joint forest management committees, water users' committees, etc). Administrators, professionals and users belong to these organisations. We are using in this paper the term 'voluntary agencies' to cover the entire gamut of voluntary sector initiatives.

The voluntary sector, people's organisations and empowerment of the people by action groups were not looked at favourably by the government till recently (with the exception of charity organisations, which were tolerated). There was much scepticism among the bureaucracy and political leaders about VAs because many of these agencies did things better and won the confidence of the people. They organised the poor or disadvantaged to secure their rights and local vested interests represented by politicians felt insecure. The bureaucracy sided with these interests. This nexus of politician-bureaucrat had created adverse opinion against people's organisations at the local and national level. NGOs and VAs were dubbed as both corrupt and 'anti-national', because many of them were funded by international aid organisations.

However, side by side, another school of thought prevailed that large programmes like poverty alleviation, provision of basic needs, literacy, women and child development, tribal development, etc, have scope for action, planning and participation by voluntary agencies at the local or regional level.

The voluntary agencies can play an important role in innovating new methods and approaches to deal with vexing issues, plan cost-effective project implementation, and get effective involvement and participation of the people. They have access to expertise and are competent in their own areas of operation.

As Bandyopadhyay puts it, these colossal national programmes "have enough space for local initiatives, innovative action [and] imaginative planning, which no centrally sponsored scheme with strait-jacketed implementation instructions can provide for. Thus, an appreciation of the deficiencies of the administrative delivery system led to the acceptance of the complementary role of the volags."

The Seventh Plan document recognised the positive contribution of the voluntary sector and stated that henceforth serious effort would be made "to involve voluntary agencies in various development programmes." It identified a role for VAs in the following areas:

(i) To supplement the government efforts so as to offer the rural poor choices and alternatives;
(ii) To be the eyes and ears of the people at the village level;
(iii) To set an example. It is possible for VA to adopt simple, innovative, flexible and inexpensive means with its limited resources to reach a larger number with less overheads and with greater community participation;
(iv) To activate the delivery system and to make it effective at the village level in respond to the felt needs of the poorest of the poor;
(v) To disseminate information;
(vi) To make communities as self-reliant as possible;
(vii) To show how village and indigenous resources could be used, how human resources, rural skills and local knowledge, grossly underutilised at present, could be used for their own development;
(viii) To demystify technology and to bring it in a simpler form to the rural poor;
(ix) To train a cadre of grass roots workers who believe in professionalising volunteerism;
(x) To mobilise financial resources from within the community with a view to making communities stand on their own feet;
(xi) To mobilise and organise the poor and generate awareness to demand quality services and impose a community system of accountability on the performance of village level government functionaries.

The Eighth Five-Year Plan (1992-97) document carried it further saying: "[I]t is necessary to make development a people's movement...A lot in the area of education (especially literacy), health, family planning, land improvement, efficient land use, minor irrigation, watershed management, recovery of wastelands, afforestation, animal husbandry, dairy, fisheries and sericulture, etc, can be achieved by creating people's institutions accountable to the community." The focus of attention was on "developing multiple institutional options for improving the delivery systems by using the vast potential of the voluntary sector".

The Plan highlighted the importance of 'people's institutions' comprised of "users/ stake holders, producers or beneficiaries", which are accountable to the local community and have the capacity to both draw up and implement need-based local level plans in close co-operation with the local administration.

The document emphasised a new direction in decentralised local level planning for optimising benefits at the grass roots level, the work for which is to be primarily undertaken through VAs and NGOs in co-operation with people's institutions and with the support of the government. The report of the National Development Council's Committee on Micro-level Planning (1994) has also underlined this point. The report says "reputed non-government organisations with proven track record are expected to be called upon to replicate their activity and carry out institution building among the people" as well as providing technical expertise to the micro-level planning body.

However, it may be pointed out here that VAs/NGOs have certain limitations. Most of them are single leader oriented, their areas of operation are limited, often confined to a few villages, a block or portion of a district. They are not accountable to the local people in any legal sense of the term, many have no internal democracy, and they depend for funds on the government or international aid agencies.

Panchayats and Voluntary Agencies

The new role of panchayats and municipalities after the 1992 Constitutional Amendments must be recognised by VAs. Since they are representative institutions of self-government, their supremacy must be accepted by VAs. According to Bandyopadhyay, voluntary agencies "should not consider even remotely that panchayats are contenders to their position, authority and power. Primacy of panchayats of different tiers as system of representative governance has to be ungrudgingly accepted". It is within this basic premise that the problems and possibilities of the relationship between VAs and panchayats/municipalities have to be discussed.

After the new panchayats have come into being through elections, four types of situations can be observed.

(a) People's organisations and voluntary agencies which were working in the space where there were no panchayats or local initiatives have established themselves in their own areas of work. They view panchayats as new entrants encroaching on their space.

(b) The newly constituted panchayats regard the voluntary sector, both community initiatives and VAs/NGOs, as rivals working in their area of jurisdiction.

(c) The third situation that emerges is that both panchayats and voluntary organisations understand their respective roles and work in harmony and co-operation to complement each other's work.

(d) In several areas, voluntary agencies participate in panchayat elections and put up their candidates. Political parties also actively participate in panchayat elections. Voluntary sector candidates either get party tickets or contest elections as independents. They are more successful at the lowest levels and it has been noticed that those who have worked with or been trained by VAs perform better in local self-government institutions.

How do VAs and panchayats view each other? In several states, voluntary agencies have a 'don't care' attitude towards the panchayats. People's organisations have a disdainful attitude towards panchayats and consider them both irrelevant and ineffective. They therefore do not see the need for any interaction with panchayats.

Since panchayats are non-functional in many states, and do not have regular meetings with correct procedures, VAs do not take them seriously. They believe that panchayats are a hot-bed of petty politics and therefore it is better to keep away from them.

The panchayats, in a majority of cases, do not inspire confidence in people as 'institutions of self-government'. Panchayat members are often unaware of their powers and responsibilities. They are often treated with contempt because of their low position in the caste and class hierarchy, low educational status, and they lack the fiscal powers to be efficacious. Moreover, a large number of women who are elected through reservations are unable to function on their own and act as proxies of male family members. Political interference in the day-to-day functioning also hampers panchayats' development. Therefore, capacity building through training, exchange programmes, visits to places where panchayats are working successfully as well as information sharing are critical. Voluntary agencies with specialised knowledge and expertise can help panchayats in this respect.

It is to be noted that VAs/NGOs have an edge over PRIs in terms of access to knowledge and the latest technological advancements. Thus, many of them are engaged in information dissemination, awareness generation, etc. For example, there are a number of organisations engaged in developing alternative renewable energy systems for rural areas.

Several VAs/NGOs have developed expertise in programmes for women's empowerment and implementation of land reforms to ensure land to the tiller. Panchayats can invite the co-operation of VAs in areas of water management, forest management, development of fishery resources, income generation projects for community members, etc.

Self-help groups, pani panchayats, watershed associations, water users' associations, community irrigation groups and joint forest management/forest protection committees and their sustainability need special mention in this discussion. The self-help groups are working in the area of small savings, micro-credit and so on, which are an important channel for financial support to the rural poor. The success of Self-Employed Women's Association (SEWA) in India may be noted here. Depletion of forest cover, increase in soil erosion, fall in ground water table have caused the formation of the watershed and water users' groups. These associations are permitted to receive up to 50 per cent of the funds of the Jawahar Rozgar Yojana (JRY) and Employment Assurance Scheme (EAS). An NIRD study says that in the watershed committees and user groups, the participation of the beneficiaries was limited to selection of the production packages and labour. The watershed committee functioned like a back bencher in the planning and implementation exercises. The approach was more sectoral than participatory action [Jayalakshmi and Annamalai 1998]. The World Bank has supported four watershed developments projects: Himalayan Watershed Management Project, Watershed Development in Rainfed Areas, Integrated Watershed Development Projects (Plains), and Integrated Watershed Development Projects (Hills). A review of these projects have shown that they are unsustainable over a long period of time.

Andhra Pradesh has about 10,000 water users' associations and distributory committees were formed to enable farmers' participation in the management and maintenance of the irrigaion system for effective, reliable water supply and distribution. Pani panchayats have been organised as a result of acute water shortage for agriculture in various parts of India. The Naogaon experiment in Maharashtra stands as an outstanding example of pani panchayats. With the success of forest protection committees in regenerating forests in states such as West Bengal, attention is increasingly focused on protection and management of forest lands with community participation. In pursuance of this objective, the Government of India issued a notification in June 1990, encouraging involvement of village committees and VAs for the regeneration of forest lands. Joint forest management seeks to restore the traditional system of forest management by community based decision-making and consensus.

In all these initiatives the critical issue is their sustainability. There is sufficient evidence to suggest that unless they are brought under the overall supervision and partnership of panchayats which are permanent, they will not work effectively. There is no other body which can ensure sustainability. Regarding the watershed committees, the NIRD study has suggested that water development teams must be constituted at the panchayat samiti and village panchayat levels to ensure their efficiency and continuity. The district level officials are unable to visit the micro-level watershed projects. In Uttar Pradesh, a bill has been passed to bring joint forest management under the purview of panchayats. Another successful example in this regard is West Bengal. In 1985-86, the West Bengal government launched a massive scheme for constructing dug wells, shallow tube wells, deep tube wells and river lift irrigation with World Bank assistance which was completed in March 1994. In view of their small command area and easy management, all the shallow and low duty tubewells were to be handed over to the panchayat samitis. Sabhadipati of the zilla parishad, in consultation with the site selection committee distributed the tube wells to the different panchayat samitis. At panchayat samiti level, the standing committee for agriculture, irrigation and co-operation further allotted tubewells to the gram panchayats. An undertaking was obtained from all the farmers included in the command area to the effect that they would purchase water supplied by the panchayat tube wells. Day-to-day working of the tube wells is looked after by the beneficiary committee which is a unique feature of West Bengal's panchayati raj. All the tube well operators are also members of the committee.

Panchayats, with their regulatory functions and emphasis on policy matters, can entrust implementation of programmes and plans to people's organisations. In this context, a number of functions performed till now solely by the state can be better performed through people's organisations, whether it be in the area of credit or agricultural marketing or in a host of other development activities. Dairy co-operatives of the NDDB model are a prime example. Still other functions can be entrusted to registered societies based on self-help, of which a shining instance is the Gramin Mahila Shramik Unnayan Samity (GMSUS) at Jhilimili in Bankura district of West Bengal. Yet again, informal associations of beneficiaries could be left to operate and maintain, for example, tube wells, eliminating departmental officials [Mukarji 1995]. This is a definite move towards enhancing the role of the voluntary sector and people's organisations under the new local government system.

A number of VAs are also working for the protection of rights of tribals and other communities to local biological resources and preservation of their knowledge about medicinal plants, etc. These are some of the areas in which VAs have done excellent work. The PRIs, now extended to the tribal areas, can invite VAs to work on these issues in order to learn from their experience and make use of their expertise for the betterment of tribal and forest dwelling communities.

People's' organisations can play a catalytic role for social change in the political process of democratic institution building. They are more responsive to different situations and are more adept at crises management. The health of civil society both determines and responds to the existence of effective people's organisations.

The gram sabha in the present Constitution is not an executive body. It represents all the voters in the village or ward, as the case may be, and they have powers to raise issues, ask for clarifications and suggest programmes for implementation. At best, they can perform the function of social audit. On the basis of their experience with the voluntary sector, gram sabhas can also play a role in identifying good voluntary agencies as well as the not so good ones.

The VAs are not a constituency for panchayat membership. As mentioned earlier, they can put up candidates in the elections as independents. However, they can play a vital role in the district planning committees (DPCs). They can get nomination to the DPCs on their own credentials. In village planning, resource mapping, setting up of voluntary technical corps of retired officers and technical persons, they can have a unique place. This can ensure better co-operation and co-ordination. Thus, both panchayats and

voluntary agencies can work together effectively in a demand driven situation, especially if they view each other as partners rather than contenders in the process of decentralisation and development.

In this discussion, another area we have to consider is the role of political parties India has adopted a multi-party parliamentary system and this is also reflected at the lowest units of democratic institutions. Political parties therefore compete with each other and work hard to establish their roots in villages, wards and towns. They take up people's problems through their front-organisations or the party fora. Wherever this machinery is strong, one finds that people's organisations are not strong enough, nor large in number and even if there are a few, they occupy a smaller space. The best example of this is West Bengal.

In states where people's organisations have a powerful base, committed workers, relevant programmes, a scientific outlook and focus on action, they play a creative role in enhancing the capability of local self-government institutions. Both in ideas and action these institutions can give a lead and also extend support to local bodies. The role played by the Kerala Sastra Sahitya Parishad (KSSP) in charting a new course for panchayats through the people's campaign for the planning process is a case in point. In Maharashtra, where the co-operative movement is strong, it can play a significant role in strengthening panchayati raj in the state.

Members of the legislative assemblies (MLAs), state level politicians and government officials play a critical role in strengthening (or otherwise) decentralised institutions. Since Independence, the trend in administration and government had been towards centralisation. From the beginning of the 1990's there seems to be a positive change in their outlook towards decentralised institutions. But they have a long way to go to keep pace with the emerging thinking on the new governance and administration paradigm.

Vibrant decentralised institutions, both in the formal and informal sector, are the bedrock of civil society. Only in a genuine democratic milieu can the civil society play its role and generate initiatives by the citizens themselves. The other side of the coin is that only an active civil society can ensure a responsible, transparent, corruption-free and efficient local self-government system from the neighbourhood level to village, town, block and district levels.

[An earlier version of this paper was presented at the national workshop on 'Decentralised Rural Development', sponsored by the World Bank and the ministry of rural areas and employment, Government of India, and organised by National Institute of Rural Development (NIRD), (Hyderabad) at Vigyan Bhawan, New Delhi.]

Overcoming Structural Barriers

Steel Industries in Brazil, India and Korea

Anthony P D'Costa

In examining state-led industrialisation, we find that state-ownership guaranteed capacity build-up in the steel industry in Korea, India and Brazil. But only Korea achieved rapid industrial change by maintaining investment momentum. A bureaucratic approach to industrial governance and populist policies limited the development of the Brazilian and Indian state-owned steel industries. A comparative study of the these late industrialising countries tells us that both innovative behaviour and institutional capability are necessary to organise capitalist production.

I
Introduction

THIS article examines the technological and institutional basis for overcoming structural barriers to industrialisation in three late industrialising countries. Using the steel industry as the empirical referent, the article adopts a historical approach to account for uneven industrial change in the three countries. It also underscores the importance of a strategic industrial policy for strengthening technological capability and maintaining an investment momentum. The classic late industrialisation experience of Japan, whereby new innovations were rapidly adopted and the state worked with the private sector in industrial transformation, became a model of sorts for the others. However, the immediate structural and geopolitical factors conditioned the actual acquisition of technology and its effective deployment. The autonomy of the state was critical for securing modern technology and sustaining the high rate of capacity expansion. The monopolisation of the more expensive, integrated segment rather than the smaller scrap-based minimills in Brazil, India, and Korea indicates the state's privileged role in national economic transformation. Capital scarcity and access to technology have been daunting entry barriers for private capital.[1] At the same time, the state, with greater resources, has attempted to regulate industrialisation on its own terms through direct participation in large-scale, integrated mills. Clearly, late industrialisation has a bearing on capacity expansion. The question is under what conditions does state intervention guarantee successful industrial transformation.

By exploring state-led capitalist industrialisation in Brazil, India and Korea we are able to demonstrate that state intervention *per se* does not guarantee technological progress. Brazil and India share 'lateness' with Korea. However, the institutional weakness found in Brazil and India sets them apart from the east Asian duo of Korea and Japan. The weak institutional basis of the state undermined the development of a technologically dynamic steel industry. Paradoxically, the private sector steel mills have not been at the cutting edge either. From this we can deduce that institutional barriers can be as much structural as they are policy induced. By differentiating the Korean case from the Indian and Brazilian cases we are able to obtain a nuanced view of uneven diffusion of technology and industrial change.

The article is divided into six main parts. Section II presents state-led industrialisation in Brazil and India – covering state-ownership of the industry, public bail out of private steel firms, and regulation of steel prices. The Korean experience is discussed for comparative purposes. Section III shows how the state, in both Brazil and India, overcame initial structural dependence to set up a domestic steel industry. By negotiating technology and finance with foreign suppliers, the state succeeded in creating new industrial capacity and expanding it gradually. However, the initial momentum in establishing the industry was lost as institutional weakness undermined the ability to keep up with changing technology. The slower pace of change in Brazil and India relative to Korea is examined in Section IV. The high investment requirement for new innovations associated with rising economies of scale made it difficult for the state to mobilise sufficient resources. The effects of these constraints have been project delays, escalating debts, and economic losses. Section V compares technological change and its diffusion in the three late industrialising countries, clearly demonstrating the superior technological capability on the part of the Korean state-owned enterprise Section VI concludes.

II
State-led Capitalist Industrialisation

State-Ownership and Industrial Policy

State-ownership of steel plants in independent India began in the 1950s. Three large, privately-held plants existed prior to India's independence in 1947. In Brazil direct state involvement came much earlier. By 1941 the National Steel Company (CSN) was formed; by 1948 Brazil's first coke-based integrated plant was completed. In Korea, the state created the national steel company POSCO in 1968. The circumstances and the conditions under which the state intervened in these countries have varied in detail. In all three countries, reducing import dependence has always been a national objective.

In the post-war period each state dominated its respective steel industry and only recently has there been a dilution of state-ownership. With few exceptions, state-ownership has been largely confined to large-scale, integrated mills, producing high value added flat products. The private sector is active in the much smaller, scrap-based EAF units, producing cheaper long products. In all three countries roughly 60 per cent of total steel output is under state-owned mills (Steel Authority of India, Instituto Brasileiro Siderurgica, and Pohang Iron and Steel Company, various issues). In the mid-1980s, the shares for Brazil and India were even higher – 75 and 70 per cent respectively. Although the bulk of Brazil's integrated mills are now in private hands, nearly 80 per cent of Brazil's steel capacity was under the government prior to privatisation in the early 1990s. In India state-ownership in 1996-97 stood at 56 per cent [Joint Plant Committee 1997].

The division of labour between the state and private sector was quite clear-cut. The former produced flat products using the integrated process, while the latter produced long products using electric arc

furnaces. The Indian state sector controlled roughly 48 per cent of flat products in 1979-80. By 1996-97 the state sector had increased its output of flat products, such as plates, coils, and sheets to 78 per cent. Privately-owned TISCO, with an integrated plant, also produced flat products. However, 57 per cent of its total output was devoted to long products, such as bars and rods [Tata Iron and Steel Company 1987]. In the Brazilian case, prior to privatisation, virtually 100 per cent of flat product production was under the state. Three integrated mills in Brazil, formerly all state-owned, also produced nearly 100 per cent of flat products. In Korea the industry structure is similar – with POSCO producing the bulk of flat products. All three countries exhibit rising share of flat products in the overall product-mix, indicating greater complexity in industrial structure.

Industrial policy in all three countries also regulated the number of players in the industry, effectively by barring entry of private capital, domestic and foreign. Brazil was the only country among the three where minor foreign ownership was permitted in the integrated segment. The Indian government in early 1950s allowed TISCO to expand capacity to 2 mt but was prudent enough to make sure that TISCO did not enter the flat products market in a big way. This would have undermined production at state-owned Rourkela and Bokaro plants. It also denied the Birlas, one of the largest family-owned, highly diversified business houses, an entry into the steel business [Krishna Moorthy 1984:60]. In Korea, Hyundai's requests to enter the integrated steel segment has been repeatedly denied for fear of overcapacity, even though state-owned POSCO has continued to expand output.

Bailing Out Privately-Owned Steel Firms

In addition to restricting the number of firms in the industry – a classic form of capitalist regulation – each late industrialising country also designed policies to support private sector development, including firms in the private sector. For example, the Indian Industrial Policy Resolutions of 1948 and 1956 reserved all new capacity in the iron and steel industry for the state. But private operations, such as TISCO and IISCO, were spared from nationalisation. The government, by virtue of a nationalised financial system since 1969, also owns 37 per cent of TISCO's shares [Krishna Moorthy 1984:308]. After several years of disastrous performance, in 1972 IISCO was nationalised. State intervention in bailing out private firms is also part of capitalist regulation, even if prompted by the immediacy of a political crisis.

In Brazil the government was forced to purchase several loss-making firms, such as Piratini, Cofavi, Cosim, and Usiba. In other cases, although limited foreign ownership was permitted, over time the government had to inject needed funds, increasing its equity by default [SIDERBRAS 1987:4; and personal interview, SIDERBRAS, Brasilia, December 1987].

Even the Korean government has been engaged in bailing out private sector steel firms. As recently as 1997 the Korean government was engaged in rescuing Hanbo Steel, a privately-held minimill, from a colossal debt of $ 5.8 billion by finding a buyer. POSCO also purchased the $ 1.2 billion debt-ridden Sammi Steel, a specialty steel producer in the private sector. In all of these cases the state undertook production and assisted private capital in their commercial viability, serving as the basis of capitalist transformation and by extension, contributing to global restructuring of the steel industry.

Price Control and Industrialisation

Perhaps the most effective form of intervention to promote capitalist industrialisation has been price ceilings for critical industrial inputs. The general Brazilian policy has been to keep prices as low as possible [Dahlman 1978:95]. With 1969 as the base, Brazilian steel prices until 1987 without exception have varied negatively from this base (personal interview, SIDERBRAS, Brasilia, December 1987). The World Bank, in one of its internal reports, remarked that price controls cost Brazilian steel producers over $ 14.5 billion during the 1977-88 period (1992:60), while another state employee in 1987 claimed a loss of $ 6.5 billion solely due to price controls (personal interview, SIDERBRAS, Brasilia December 1987). These losses have been a part and parcel of state-led capitalist regulation. The symbiotic relationship between the state and private capital was pronounced in Brazil as the state propped up transnational capital for industrial transformation [Evans 1979]. By third world standards the Brazilian state has successfully fostered a relatively large auto industry [Mericle 1984]. From a mere 38,000 units in 1960 its output jumped to 7,31,000 by 1989, representing an average annual growth of 63 per cent [Dicken 1992:271]. In 1995 Brazil produced 1.7 million vehicles, spurred on by various incentives offered in the past to the foreign-owned auto sector, such as income concentration policies and low-priced steel. With sluggish domestic demand in the 1980s, export competitiveness necessitated cheap steel (personal interview, Acominas, Belo Horizonte, December 1987).[2] As the auto industry controls a large number of jobs and is a major foreign exchange earner its power and influence has been substantial.[3]

The strong relationship between the state and private (foreign) capital to foster capitalist development was succinctly captured by a Brazilian scholar:

> The production of capital and consumer goods was promoted by the bourgeoisie and by the military on the assumption that it would create the necessary economic structure for accumulation. Now there is a strong, well diversified economic structure but which is highly internationalised ...The creation of BNDE [the National Bank for Economic Development] was a clear manifestation of an industrial push and the underwriting of private capital accumulation. Now we have the triple alliance with the state controlling a large part of the economy. The debate is how to *destaticise*. But the bourgeoisie wants the state (personal interview, Otavio Ianni, Catholic University, Sao Paulo, November 1987).

In contrast, the Korean strategy for accumulation attempted to interface nationally-owned upstream and downstream economic activities. By keeping prices low, the state-owned company followed the Japanese example of supporting metal-working industries and infrastructure sectors. Kim notes that "in addition to the construction and shipbuilding industries, the [government's attention] turned to the automotive industry" (1985:10). POSCO's cost competitiveness was passed on to steel-using industries in the form of lower prices.[4] There is a tacit understanding between the government and POSCO that prices must be maintained at 'competitive' levels. The *raison d'etre* for capitalist transformation is not high financial surplus *per se*. Rather, it is the creation of an industrial foundation on which capital as a whole expands.[5] Instead of propping up foreign capital as in Brazil or incurring heavy losses as in India, the Korean state steel company by being competitive nurtured a dynamic capitalist class.

III
Overcoming Structural Dependence

Establishing a Domestic Steel Industry

As late industrialisers, India, Brazil and Korea were able to enter the steel industry by bargaining and exploiting any opportunity that arose in the international

geopolitical situation. Korea was the most successful in rapidly establishing an internationally competitive industry (Figure 1). The growth and expansion has been spearheaded by POSCO – the state-owned firm. However, Korea's private sector in the last decade also added significant capacity, nearly 10 mt.

Since the late 1960s Brazilian integrated capacity has also grown significantly (Table 1), with an incremental addition of nearly 10 mt of capacity in the 1970s. In three phases, spanning two decades, the Brazilian state added a net integrated capacity of 14.5 mt. The state controlled five large integrated facilities along with a few smaller non-integrated units, which had resulted from bail outs of private firms. The integrated segment's output in 1996 stood at 18 mt.

The Indian state actively promoted heavy industry through its five-year plans (Table 2). From less than 2 per cent of total public sector outlay during the First Plan, the Indian steel industry steadily gained nearly 8 per cent of total outlays in the Third Five-Year Plan. While steel's share of public sector outlays fell, overall outlays in nominal terms roughly doubled in each successive plan period. Correspondingly state's steel-making capacity increased from 3 mt to nearly 15 mt, capturing over 80 per cent of the country's integrated capacity. From the Fourth Plan onward, investment in the Indian steel industry remained sluggish until the mid-1980s. Three million tonnes of capacity was added between the Sixth (1981-85) and the Seventh Plan (1986-90).

Mobilising Finance and Acquiring Foreign Technology

In the 1920s Brazil imported nearly 100 per cent of its domestic consumption [Baer 1969:61]. By 1936 Brazil was producing about 74,000 tonnes of steel, somewhat reducing its import share. Local production in the 1920s was confined to small charcoal-based units with Belgo Mineira, a foreign company, producing the largest share of Brazilian output. Rising imports and the refusal of Belgo Mineira to expand capacity prompted state intervention. International tensions prior to second world war, which restricted the access to steel technology from the world market, compelled the military to investigate the possibilities of establishing a steel industry in Brazil [Hilton 1982].[6] Under president Getulio Vargas, the minister of war in 1931 created the National Steel Commission. Although local capitalists were wary of the government's attempts to set up a large coke-based integrated works they were never excluded [Evans 1979:89]. However, the scale of investment and the complexity of integrated steel production was much too daunting for Brazilian private capital.

Bargaining with the governments of Germany and the US in late 1930s to obtain capital equipment ultimately paid off for Brazil, a typical strategy late industrialising countries resort to to override structural dependence. However, US Steel withdrew from the project when it failed to secure equity control. This reflected the general vulnerability of borrowers of technology. Similar to the Japanese unwillingness to transfer technology to Korea, US Steel also found it against its interest to transfer technology and forego exports to the growing Brazilian market.[7] However, lest the Germans clinch the deal, the US Export-Import Bank in 1940 promised to provide $ 20 million to finance the project [Baer 1969:76]. The loan was raised to $ 45 million. State involvement of the supplier country is also typical of such transactions, aimed to promote national capital, in this case American equipment suppliers. In 1941 the National Steel Company (CSN) at Volta Redonda in the state of Rio de Janeiro was formed. About 50 per cent of the initial investment requirement of $ 25 million was provided by the savings and pension banks [Baer 1969: 76]. The supply of slabbing and rolling mills was delayed by Mesta Machine of Pittsburgh as international war-like conditions emerged. As a result the cost of the project increased by 60 per cent. In 1948 the first integrated plant with a capacity of 0.27 mt ingots was completed.

The Indian experience with external suppliers has been similar to Brazil's in terms of financial dependence, scale of plants, and process technology acquired. Western countries and international agencies, particularly the World Bank, did not favour state-sponsored heavy industrialisation in India.[8] TISCO notwithstanding, India's technological capacity and financial resources were limited. However, the government's plans were ambitious, targeting three 1.0 mt plants. Strategic bargaining by the Indian state with foreign players was essential. Britain, when first approached, immediately turned down the request. Soon thereafter a West German consortium offered to construct a half-a-million-tonne plant at Rourkela in the eastern state of Orissa. The Germans offered only very small blast furnaces. Not to be outdone, prime minister Jawaharlal Nehru successfully signed an agreement with the Soviet Union for a 1 mt plant at Bhilai in central India.[9] Both Britain and

Table 1: Integrated Steel Capacity Expansion in Brazil

Plants	Initial Capacity	Phase I 1967-74	Phase II 1970-79	Phase III 1973-88	1996 Output
CSN (0.27)*	1.4mt	1.7 mt	2.5 mt	4.6 mt	4.4 mt
COSIPA	0.5 mt	1.0 mt	2.3 mt	3.5 mt	3.6 mt

West Germany agreed to provide technical and capital assistance. The West German consortium went further by drastically altering the design of the plant in favour of larger blast furnaces and introduced India's first BOFs. However, doubling the designed capacity for the German plant to one million tonnes entailed inordinate delays. Their engineering skills notwithstanding, the Germans squeezed the additional capacity into the original plant layout, congesting and effectively curtailing future possibilities.[10] The British-aided plant had no Detailed Project Reports, reflecting the weakness of the Indian state in bargaining with technology suppliers. The project was also plagued by construction delays. All three 1.0 mt plants commissioned in India with the aid of British, German, and Soviet assistance exhibited varying technological and financial attributes.

The post-war expansion of the steel industry in Brazil was state-owned more by default than by design. Unable to marshall resources, the industrialists of Sao Paulo, with the state of Sao Paulo as a partner, yielded to federal financing for the COSIPA plant near the city of Sao Paulo. Loans from the government's National Bank for Economic Development that set up the new steel company in 1953 were progressively converted to equity [Baer 1995:249]. The plant was finally completed in 1965. Rather than completely relying on foreign suppliers for the COSIPA plant, the state-owned CSN worked with American and British suppliers to equip the plant. The participation of a local firm indicated local technological capability. However, like other plants of the time, COSIPA installed very small BOFs.

Initially firms from advanced capitalist countries were heavily involved in late industrialising countries as both suppliers of capital and technology. Foreign ownership, however, was restricted. As Japan continued to expand capacity at home, its need for ensuring secure sources for raw materials became critical. Brazil and India with high-quality iron ore deposits were considered important sites. Japanese firms selectively invested in mines in both countries and in Brazil even participated in a steel project. In addition to COSIPA, another integrated steel plant, USIMINAS, was proposed in the Brazilian state of Minas Gerais.[11] After creating the company in 1956, negotiations were held with the Japanese, Germans, and some east European countries. Nippon Steel of Japan headed the consortium for the construction of half-a-million-tonne capacity plant. Production was started in 1962. In lieu of planning and equipment supply, the Japanese agreed to 40 per cent of equity [Baer 1969: 81]. They also provided 60 per cent of equipment credits at 6 per cent interest payable over 15 years, with interest-free loans for the first three years. Such soft terms were a result of Japan's coming of (industrial) age and USIMINAS was designed to be a showcase project [Dahlman 1978:45]. It was a modern plant, incorporating 50-tonne BOFs. It may be recalled that in the late 1960s the Japanese also participated in Korea's first integrated steel project in Pohang. They supplied capital and technology but unlike in Brazil were barred from owning equity.[12]

The pattern of ownership in Brazil, however, remained skewed in favour of state-ownership. Structural dependence implied that shortfalls arising from construction delays must ultimately be borne by the state. This was true in the Brazilian case, even with foreign capital participation. As in the case of the COSIPA plant in Brazil, when Japanese construction costs escalated, the National Bank for Economic Development (BNDE) was compelled to inject additional funding. As a result Japanese equity was diluted to about 20 per cent [Fischer et al 1988:167], falling to about 13 per cent before COSIPA's privatisation in 1991. The federal government through BNDE, had over 50 per cent equity of both COSIPA and USIMINAS. The local state governments owned about 24 per cent each in their respective plants. Government companies, including steel firms and the state-owned mineral pro-

ducer CVRD, and some small private groups controlled the remaining shares. Increasingly, however, with successive expansion of its integrated plants, SIDERBRAS – the state steel holding company – absorbed the financial liability of these plants.

Financing of Indian plants was relatively straightforward. The bulk of the funds came from the state treasury, the rest from foreign sources. India's economic status and its geopolitical alliances ensured relatively easy terms and conditions for financing capital equipment for the first three 1.0 mt plants. They varied from 2.5 per cent to 6.3 per cent interest rate with repayment periods ranging from three to 25 years [Krishna Moorthy 1984:87]. West Germany had the most stringent conditions and also entailed a greater share of foreign exchange requirement (56 per cent) while the Soviet Union offered the easiest terms at 2.5 per cent interest for 12 years with a foreign exchange component of 49 per cent [Krishna Moorthy 1984: 90]. For the three 1.0 mt plants, the foreign exchange component was around 51 per cent of the initial investments. The first expansion of these plants reduced the foreign exchange component to about 47 per cent.

Growth of Steel-making Capacity

In 1971 the First National Steel Plan of Brazil outlined an installed capacity of 20 mt by 1980. This target was not met, even though the rate of expansion was quite rapid. Between 1960 and 1970, steel output tripled from 1.9 mt to nearly 6 mt, while between 1970 and 1980 output tripled again to 15.3 mt [Guerra, Botelho, Teixeira 1989:40]. Investment was high, picking up from 1976 until 1979 and declining thereafter. The Brazilian debt crisis dampened the investment momentum in the 1980s, picking up again in the early 1990s. Nearly $ 21 billion was invested with an annual average of nearly $ 1.5 billion. Aside from capacity expansion of existing plants, two greenfields (CST and Acominas) were constructed. CST is a technologically modern plant with major equipment from Japan and Italy. Kawasaki Steel of Japan and Finsider (part of the Italian state-owned Italsider) have 13 per cent each capital participation in CST (personal communication from CST, May 1988). Prior to its privatisation, Acominas was 100 per cent state-owned.

For India's fourth integrated plant in Bokaro, the Soviets came forward with assistance after president Kennedy could not persuade the US Congress nor the American steel industry to participate in

Indian state ventures. US Steel had insisted that management of the plant be entrusted to them for at least 10 years. This was unacceptable to the Indian government and India withdrew its request for US aid.[13] Even Tata of TISCO, the private sector integrated firm, tried to convince the US of the inability of the Indian private sector to raise the necessary capital. Negotiations were renewed with Britain, West Germany, Japan, and the Soviet Union with the expectation that no single country would be able to finance the entire project and at the same time India would not have to depend on any one country. The Soviet Union, however, offered to provide financial and technical assistance for the entire project. In subsequent years India also upgraded its three 1.0 mt plants and added two integrated greenfields – at Bokaro in the eastern state of Bihar and at Vishakapatnam in the southern state of Andhra Pradesh as part of its steel expansion plan.

The Soviets also participated in the Vishakapatnam (Vizag) plant. It is India's most modern integrated plant. Of the total project cost of Rs 60,000 million (equivalent to $ 4,615 million) only 6.5 per cent has been provided by the Soviet Union (personal interview, Rashtriya Ispat Nigam, New Delhi, July 1987).[14] While an Indian consultancy firm has been retained to oversee the construction of the Vizag plant, reliance on foreign technology and capital has continued.[15] Up to the steel-making stage the Soviet Union has collaborated on the project. Two rolling mills were provided by the former Czechoslovakia and the third-one by former West Germany. The collaboration with the former East Bloc country has been based purely on financial conditions. Its financial package is a soft loan carrying an interest rate of 2.5 per cent repayable over 20-25 years. It is also payable in Indian rupees through barter trade. On the other hand, the West German loan carries an interest rate of 14 per cent.

IV
Institutional Challenges to Industrial Change

Without a doubt, the states in all three late industrialisers overcame the problem of resource mobilisation and technology availability, albeit from different sources and in different degrees. They successfully added capacity, contributing to the general shift of productive capacity away from the advanced capitalist countries. However, the expansion in Brazil and India has not gone unchallenged. Several problems have subsequently arisen, mainly in the areas of technological capability and financial performance. States in these two countries, despite their heavy involvement in the economy and industry, have been subject to institutional weakness. This was in spite of the independence of Indian businesses and the state from foreign capital [Encarnation 1989]. This institutional weakness is different from 'social capability', which centres on the development of human capital [Abramovitz 1989]. Rather institutional incoherence is a result of the penetration of political and social forces that effectively undermine the state's regulatory capacity to organise industrial production. This could be in the form of political appoint-

ments of state sector personnel, often resulting in the lack of continuity in management. Both Brazil and India have been subject to such forces and therefore exhibit far greater degree of organisational and institutional weakness than Korea.

The Korean government was quite successful in keeping popular forces at bay. History was on its side as well. Korean state autonomy evolved from the dissolution of archaic social structures [Hamilton 1986, 1983, Kwon 1991, Amsden 1989: 27-5] and US geopolitical interest [Haggard 1992]. Relying on state-guided capitalist industrialisation [Lim 1985:35], the military leadership under Park Chung Hee forged new institutional arrangements between the state and workers. State support of dynamic yet state-dependent industrial groups and repression of labour were the two main foundations of capital accumulation. State autonomy was enhanced by sacking officials and creating a centralised, technocratic Economic Planning Board (EPB) and nationalising and reorganising the banking sector [Koo and Kim 1992:125-26, Haggard 1992:64-65). Dissent and opposition were silenced by both force and rapid growth, making bureaucratic economic management relatively easy [Ogle 1990, Deyo 1989, 1989, Lim 1985:71-72].

As in the Brazilian and Indian cases, the ideology of industrialisation was grounded in nationalism. However, unlike India, Korea did not shut out foreign capital, and unlike Brazil it preferred loans over foreign direct investment [Griffin 1991: 122-23]. Additionally, the state's access to and extraordinary control of foreign exchange allowed it to select investment projects and orchestrate big business expansion. Unlike Korea, where the military state was insulated from everyday politics, the Brazilian and Indian states have been captured by capitalists and organised workers alike. While private capital in Brazil, domestic and foreign, sought to extract state largesse, such as subsidies, public sector unions in India, with the help of the state, protected their relatively high-paying jobs. Consequently, the performance of the state-owned sectors in Brazil and India have been less than spectacular, despite significant capacity additions. How institutional incapacity has technologically and financially hamstrung the steel industries of Brazil and India is discussed below.

New Technology and Institutional Weakness

The relatively early entry of Brazil and India understandably resulted in small plant size, typically under one million tonnes. India's three 1.0 mt plants in the 1950s and 1960s were ambitious by most standards. However, blast furnace innovations by the Japanese had raised the minimum efficient scale significantly. Related changes in rolling mill technology added further to overall scale of production. It was not unusual to find integrated plants ranging from 2.0 to 10.0 mt annual capacity. Consequently total capital requirements also increased dramatically, running into the billions of dollars.

The evolution of capacity expansion in Brazil and India shows that neither one has been able to keep up with changing economies of scale. By 1973 Brazil's largest plant was under 2 mt and the average size of three state-owned integrated mills was 1.37 mt. On the other hand, India's Bhilai plant built by the Soviets had already reached 2.5 mt by 1967. The average size in the 1970s for the four original state-owned integrated plants was 1.9 mt, considerably larger than those of Brazil. However, both averages fell considerably short of the prevailing Japanese average of 7.6 mt [National Academy of Engineering 1985:34].

In the past two and half decades both Brazil and India increased their plant size but could not maintain best-practice scale economies. With further investment, Brazil was closer to attaining economic scales with average plant size of over 3.5 mt of crude steel capacity. This was attained over several years in several phases. The Indian average, on the other hand, dropped drastically for want of investment funds, technical problems with existing capacity, and the government's bailing out of IISCO, a technologically obsolete firm. In the mid-1990s India's average plant size, including India's most recent greenfield, stood at 2.56 mt. This average is considerably lower if real capability is considered. For example, two plants located in the eastern state of West Bengal, IISCO and Durgapur Steel, have been unable to produce at their designed capacity. On an average they have had a utilisation rate of only 47 per cent during the 1988-93 period [computed from Steel Authority of India Limited 1994:21]. It is instructive to note that POSCO, Korea's state-owned firm, began with a 1.03 mt capacity in its first stage construction of Pohang and attained a size of 5.5 mt by 1978. By 1995 average integrated plant size stood at 11.5 mt, exceeding the Japanese average.

With declining demand in the advanced industrialised countries and technological obsolescence in the 1970s and 1980s in the mature countries, Korea could induce competition among equipment suppliers and extract state-of-the-art technology at low cost for its integrated mills. For example, POSCO purchased a blast furnace from Davy McKee, a British firm, at an interest rate of 4 per cent below OECD standards. With increased competition among equipment suppliers, ironically the sellers have also become dependent on creditworthy buyers.[16] This ability to bargain with equipment suppliers could not be reproduced in Brazil and India because of a lack in strategic vision. The institutional delays in project completion also undermined bargaining effectiveness. Both countries set up greenfields, CST and Acominas in Brazil, and Vizag in India in the 1980s, the decade in which POSCO's Kwangyang Works was constructed. Yet a closer examination shows that plants in Brazil and India, despite their recent vintage, display various symptoms of poor planning.[17] These are in the areas of technology choice, product mix, siting, and investment costs.

Comparing costs internationally is difficult. The reluctance of firms to divulge the actual terms and conditions make the numbers at best reasonable estimates. Brazil's greenfield CST, with a 3 mt of annual slab capacity (without continuous casters) has been estimated to cost a massive $3.13 billion, an average of $ 1043/tonne (Table 3). Seventy per cent of this outlay was for construction and equipment,

Table 5: Diffusion of Modern Technology: BOF[a] and Continuous Casting[b]

	1960	1965	1970	1975	1980	1985	1990	1995
US	3.7	19 4	55 8(3.7)	74.3(9.1)	83.9 (20 3)	89.0(44.4)	94.3(67.1)	100 0(91 0)

while the remaining 30 per cent was for site preparation and interest payments during the construction period.[18] CST's equipment, up to the hot metal stage, is 'world class', with a blast furnace capacity of 3.285 mt with a yield rate about 89 per cent (from the ingot up to the slabbing stage). However, CST did not produce high grade products and it was commissioned earlier than Korea's Kwangyang Works. Yet its investment cost was higher than Korea's Kwangyang Works of $ 637/tonne, less than two-thirds the cost of CST.[19] POSCO also claimed that the second phase of another 2.7 mt capacity cost only $ 370/tonne. Such a low cost has been attributed to the completion of most of the infrastructure in the first phase. The average investment per tonne for 5.4 mt worked out to only $ 480. The total investment being a little more than two and a half billion dollars.

Technologically Brazil's CST, Korea's Kwangyang, and India's Vizag plants share similar characteristics – modern, large-scale blast furnaces, BOFs, and computerised process controls. However, there are several glaring shortcomings when CST and Vizag plants compared to Kwangyang. First, the investment cost per tonne. All the non-Korean plants have a much higher cost than Kwangyang, with Vizag's cost at $ 3,000 per tonne. Admittedly, there is considerable disagreement over POSCO's claims of $ 637/ton (personal interviews, Nippon Steel Corporation, Nippon Kokan, Japan Iron and Steel Federation, Tokyo, October 1987; SIDERBRAS, Brazilia, December 1987). However, if we use the market rate of $ 1,000 per tonne, we still find POSCO to be investment competitive. Though CST's costs are marginally higher, its plant and equipment are well below Kwangyang's technologically. Unlike Kwangyang's wide range of flat products, CST produced semi-finished slabs for the export market. Until recently, CST relied on the traditional ingot casting method, thereby bypassing investment in expensive continuous casters and rolling/finishing mills.

Second, Acominas is located inland whereas CST is not. Japan, followed by Korea, has demonstrated the efficacy of tidewater locations to import raw materials and export finished products. Coastal locations also have built-in economies of scale as export markets can be potentially tapped should the need arise. CST was designed for the export market and Kawasaki's participation has had a bearing on its siting. For Acominas on the other hand, the nearest port and most major markets are over 400 km away. It relies on imported coke that has to be transported over long distances by rail.[20]

Third, the product mix of output either deviated from actual market demand or was simply poorly planned.[21] All the non-Korean greenfields produce relatively low value added products, such as semi-finished slabs, billets, and long products, such as wire rods. While slabs can always be finished into high quality flat products, including coated sheets, billets and long products are essentially destined for the construction market where quality is not a major requirement. India's latest integrated greenfield at Vishakapatnam has been one of the most expensive plants in the world. Its choice of product mix (long products) is questionable as well, given cheaper alternative technologies for such products. Acominas' product mix was designed to meet the emerging railway products market but the Brazilian National Railway Project never took off. This is not surprising given the powerful transnational automobile industry lobby. The huge investment incurred for the wrong products when there are far less expensive alternative technologies, such as DRI/scrap-based processes, reflects the institutional weakness of the two governments.

The inability of both the Indian and Brazilian governments to avoid such elementary yet very costly technical blunders can be attributed to the lack of state autonomy. Whereas POSCO could bargain hard with foreign suppliers precisely because of its insulation from political and bureaucratic meddling, Brazil and India were beholden to various political forces and regional rivalries. The inefficiency of the Indian public sector steel company was partly a result of bureaucratic regulation that undermined coherent decision-making. Numerous government agencies worked at cross purposes, slowing the investment momentum and creating a technologically deficient industry. The haphazard manner of technology upgrading is evident from the fact that new technology such as BOF-CC is adopted for expansion without scrapping the old technology such as the OH and ingot casting. The Soviet-assisted Bhilai plant is a classic example where both old and new technology coexist, leading to technological fragmentation [D'Costa 1998]. While such decisions are based on cost considerations they do not address the establishment of long-term viability of capital accumulation through technology-induced productivity increases [Sengupta 1984:207-08].

Unlike the Brazilian state-owned firm, the Korean state-owned company has been able to reduce its dependence on foreign capital and enhance its financial strength. For example, POSCO reduced the foreign loan component from 53.4 per cent for Pohang to 29.3 per cent for Kwangyang [Pohang Iron and Steel Company 1987:4]. Whereas self-financing was 75 per cent for Pohang, it was 100 per cent for Kwangyang, clearly reflecting greater availability of internal resources [US International Trade Commission 1988:10-16]. Almost all foreign loans for the Pohang plant have been repaid and only about 40 per cent ($ 676 million) for Kwangyang remained unpaid in the early 1990s [Pohang Iron and Steel Company 1992:8]. POSCO also raised revenues through stocks. In March 1988 POSCO released more than 25 per cent of its stock that was owned by private banks to the general public. Three months later they were traded at nearly triple the original value (*Metal Bulletin*, June 16, 1988:31). The value of 21 per cent of POSCO's 91.8 million shares was approximately $ 8.34 billion (717 won/US dollar). This represented nearly 6 per cent of the value of all shares listed on the Seoul Exchange at the time.[22] While normal profits have been low by private sector standards, POSCO's offer of stock dividends in lieu of cash dividends was readily accepted [US International Trade Commission 1988:10-16]. Standard and Poor granted POSCO an A+ credit rating, the highest attained by any South Korean company or any steel-maker in the world [*Business Times* 1992:67-68]. Raising loans on the foreign credit market is no longer a problem for the South Korean steel industry nor is POSCO dependent on the Korean Treasury.

Unlike the institutional paralysis found in India, the articulateness of the Korean strategy speaks volumes for institutional capacity. POSCO, with the help of the state, maintained an investment momentum and kept up with technological change. The Korean company found ingenious methods to create a world class steel industry. With institutional autonomy POSCO could resort to 'delay tactics' to secure best-practice technologies (personal interview, POSCO, Pohang, October 1987). One delay tactic entailed a negotiating process whereby POSCO first progressively stiffened the terms and conditions of purchasing technology to eliminate all but one potential supplier and then negotiated a technology transfer at favourable prices. Once the terms were accepted, they were quickly followed up for effective transfer and absorption of technology [Enos and Park 1988:234]

This kind of autonomy was missing in the Indian and Brazilian steel companies.

Institutional Capacity and Industrial Relations

The recent greenfields constructed by Brazil and India, though technologically not far behind Korea's, suffer from a host of commercial and financial problems. The expansion of steel capacity in Brazil and India has been also accompanied by unfettered growth in employment at the industry-level. While employment growth is difficult to check under a rapid investment programme, Korea has not succumbed to the pressures of maximising employment even though POSCO's public sector status makes labour redundancy difficult (Table 4). In contrast, India and Brazil have followed a growth path that is quite out of line with industry standards. The five Indian integrated plants with an aggregate crude steel output of 9.83 mt employed nearly 1,85,000 employees, compared to POSCO's 23,951 for an output of 20 mt in 1992. India's private integrated firm, TISCO, was marginally better than the state sector with 43,324 workers producing 2.5 mt of crude steel. This average of 57 tonnes per worker per year is close to SAIL's 53 tonnes per worker per year. The 1992 average per employee output for the Brazilian steel industry was 218 tonnes per year compared to Korea's 420 tonnes per year [Instituto Brasileiro Siderurgica 1997; Korea Iron and Steel Association 1995]. Japanese output per employee was 602 tonnes of crude steel for 1995, reflecting greater automation and more efficient operations.

The large discrepancy in employment between India and the others, and by implication productivity, can be explained by both technological and institutional factors. We have already examined the barriers associated with structural dependence and the challenges emanating from institutional weakness. Indian restructuring has been particularly hard hit from this weakness, compounded by the demands of public sector steel workers in alliance with various political parties. Unions are neither able to aggregate their collective interest nor, given their veto power, do they allow the state enterprise to make decisions that are relatively independent of political interference.

The over-politicisation of industrial relations, particularly by external agents, has led to severe overstaffing on the one hand and labour strife, albeit declining, on the other in many state-owned steel plants. Two of them in the state of West Bengal employed nearly 50,000 employees with a total output of less than 1.5 mt per annum, with average output in 1992-93 of less than 50 tonnes per employee a year [Steel Authority of India Limited 1994]. This is about 6 per cent of POSCO's 835 tonnes per employee output in 1992 [Pohang Iron and Steel Company 1996]. Different vintages of capital equipment, capital-intensity of the production process, and the degree of subcontracting have a bearing on such productivity differentials. Both of these plants in the state of West Bengal are labour-intensive and employed obsolete plant and equipment. However, politicisation also has been rampant, accounting for nearly 100 per cent of all the major steel-industry related industrial disruptions in India in the late 1960s and early 1970s [Krishna Moorthy 1984:336].[23]

Lately, industrial relations have been on the mend but excess manpower has been a heavy institutional legacy in India [Rudolph and Rudolph 1987:260-62]. A 'sons of the soil' policy by which local residents are employed with the gradual absorption of contract (construction) labour as permanent employees has added to the payroll without contributing to productivity.[24] For example, Vizag, India's most recent greenfield, which boasts state-of-the-art technology, was compelled by local political groups to hire a large number of the local population displaced by the plant. Nearly 25 per cent of them were illiterate [Venkata Ratnam et al 1995:269]. As project delays mounted nearly 13,000 individuals claimed to be displaced. Vizag already employs 15,000 workers, with average output per employee of 200 tonnes a year. Granted this is nearly two to four times the average of older integrated plants, both state and private, but is about a fourth of POSCO's average. The Indian private sector integrated company, TISCO, did not escape this 'compassionate' hiring practice found in the Indian state-sector and often fuelled by populist politics. At the time of its 1980s modernisation programme, it recruited 2,000 local unskilled and unemployed workers.

Brazil also suffers from institutional deficiencies, albeit on a lesser scale than India. The presence of foreign capital and their local partners within the framework of a corporatist regime [Bordin 1986, Wesson and Fleischer 1983:56] has limited the capacity of the Brazilian state to empower state-owned firms to maintain commercial viability. On the one hand, labour has been repressed under military regimes and on the other, pampered into participating in the corporatist arrangement.[25] Thus the favoured unions in the industrial sector, particularly those under the public sector, have benefited from this relationship. Generating employment and maintaining high wages in the public sector as state objectives have subsequently followed, creating institutional impediments to technology-based restructuring. Even as early as 1967 when the First National Steel Plan was being formulated, the Special Advisory Group on the Steel Industry reported that there was surplus manpower in the industry [Dahlman 1978:78]. High levels of employment have continued in the state-owned steel plants. In 1990, the five state-owned integrated plants had an employment level of 59,635 [World Bank 1992:86] and total crude steel output of 15.81 mt in 1991 [Instituto Brasileiro Siderurgica 1996:1/7]. Roughly, per employee output was 265 tonnes per year or 32 per cent of POSCO's output per employee.

In the late 1980s the Brazilian state steel industry apparently employed 40 per cent more labour than actually required (personal interview, SIDERBRAS, Brasilia, December 1987). To be more competitive industry officials at Acominas opined that manpower should be reduced by 10 per cent (personal interview, SIDERBRAS, Brasilia, December 1987). In individual plants, such as Acominas, industry officials suggested that as much as 30 per cent of non-production staff of 2,000 was excess manpower (personal interview, Acominas, Belo Horizonte, December 1987). But at the same time state managers pointed out that retrenching labour was counter to the 'social' objective of maintaining employment. This implied a low diffusion rate of automation on the one hand and reduced autonomy of the state enterprise in expanding best-practice technologies on the other.

Korea's POSCO faced a very different industrial relations system. The state established the Federation of Korean Trade Unions (FKTU) to consolidate all unions under a single agency and most unions were co-opted [Deyo 1987:185].[26] Labour-management councils were set up at the behest of company management under the state dominated Korean industrial relations [Im 1992]. Strikes were banned, particularly in public sector firms. In 1987 national labour laws permitted union formation. But they neither undermined the FKTU nor eliminated the consent of the ministry of labour for forming unions. Evidence of an anti-labour stance persisted even as Korea in 1991 became a member of the Geneva-based International Labour Organisation.

Until 1988, POSCO's employees were non-unionised. All grievances were

handled by labour-management councils that met once a month. POSCO's management has been insulated from the government, thus enabling POSCO to arbitrate labour disputes effectively. In August 1987 when most of Korea's heavy industrial workers went on strike demanding higher wages, POSCO's employees were conspicuously absent [*Business Korea* 1987:11-12; personal interview, POSCO, Pohang, October 1987]. The demands of POSCO labour, despite widespread strikes in other related sectors, were contained by a number of strategies. First, POSCO wages have been maintained at twice the manufacturing average and employment is lifetime. POSCO employees also get excellent non-pecuniary benefits, such as housing and children's schooling. Second, as a significant portion of the work is contracted out [Amsden 1989: 209] and POSCO jobs are coveted, wage demands are stabilised through higher wages for regular workers. The threat of further subcontracting dampens many labour demands. Workers themselves are quite conservative, especially older ones. Third, POSCO management has distributed about 10 per cent of its stock to its employees. These strategies, in conjunction with a highly regimented workforce, have made POSCO strike-free and highly competitive. Its employees log an average of over 55 hours per week, higher than most other Korean industries (personal interview, POSCO, Pohang, October 1987).[27] Absenteeism is very low and paid leave extremely limited [Amsden 1989:212]. With recent democratisation of Korean politics [Hart-Landsberg 1993:279], independent unionisation in POSCO did not catch on [Innace and Dress 1992:176]. Formed in 1988 POSCO's union lasted just three years, indicating the weight of 'patriarchal company welfarism' [Hoon and Park nd:5] in stifling collective dissent.

Delays, Debts and Deficits

Inexperience with large-scale projects can understandably lead to delays, cost overruns, and losses. But as we have seen, even after overcoming structural dependence, institutional weakness has been a continuing feature in Brazil and India. Korea on the other hand mostly avoided these difficulties. In contrast to Brazil and India, where project delays and cost overruns were common, POSCO contained construction costs by completing projects on time. Modern facilities notwithstanding, several greenfield projects in India and Brazil have been white elephants. For example, the costs incurred for Acominas and Vizag were too high relative to international norms and did not justify the scale, location, or product mix. With respect to the industry as a whole, while Korea narrowed the technological gap with Japan, several Indian plants became technologically obsolete. It is evident that even as the state co-ordinated investments and expanded steel-making capacity it was beset with institutional incapacity.[28]

Compared to Brazil, the Korean experience has been different. For example, POSCO secured cheap supplier credits with 5-7 per cent interest and 10-20 year repayment periods [Paine Webber 1985:1-9]. Low wage rates for construction, round the clock construction work, and timely completion of projects contributed to POSCO's lower costs, especially by reducing the interest burden. In contrast, the Brazilian authorities have not been very effective in negotiating with foreign suppliers. Stringent financial terms and the general delays in project implementation raised costs significantly.[29] Further refinancing was needed that carried even stiffer conditions [CST 1985:15].[30] Cost overruns were higher in the case of Acominas, Brazil's newest greenfield plant. Most of the equipment was obtained from Europe, mainly Britain and France. Commissioning the plant took nearly a decade and Phase I remained incomplete as late as 1988. Millions of dollars of rolling mill equipment lay idle at the plant site for several years. Shortage of funds and conflicts over siting nearly doubled the original estimates. In 1978 the estimated cost was $ 2.7 billion. By the time the plant was completed in the early 1980s total cost was over $ 6 billion. Its interest payment alone was $ 2.246 billion [Acominas 1986], an amount exceeding POSCO's first stage investment for Kwangyang.

Institutional weakness has also meant financial dependence on international firms and negative return on investment. For example, CST relied on routine supplier credits (or tied loans) to finance equipment imports. But in exchange, SIDERBRAS, the state holding company, permitted foreign equity. Part of the agreement also included supplying a fixed amount of slabs from CST to be sold to Kawasaki and Finsider, its foreign partners. These commercial arrangements, while providing a captive market and a source for foreign exchange earnings, were not necessarily the best option for CST. For example, in the first half of 1988 CST's average slab export price was about $ 192/ton while the domestic price was $ 223 (calculated from *Metal Bulletin* July 21, 1988:25).

While export markets bouyed capacity utilisation and generated foreign exchange reserves, lower export prices translated into signficant losses for the firm and mounting debts as well. In 1987, SIDERBRAS, the state-owned holding company had over $ 17 billion in loans. Its profitability, measured in terms of net profits as a percentage of sales, from 1979 to 1985 has been consistently negative. The highest loss was negative 75 per cent in 1985 [SIDERBRAS 1987:38].

Nor has the Indian steel industry been immune from financial hemorrhaging. Various construction delays – over three years for the German-assisted Rourkela plant – and cost overruns have been typical. Investment cost for Rourkela, estimated in 1955, increased by over 80 per cent by 1963. At the end of 1982-83, with delays in project execution, the expansion cost for Bhilai for an additional 1.5 mt increased by nearly 200 per cent within eight years [Krishna Moorty 1984:107]. Although the foreign exchange component declined to 11 per cent, the additional expansion was again under open hearth process, a technology that was already obsolete. The Soviet-assisted Bokaro plant also suffered delays and cost increases and, despite easy credit terms from the Soviet Union, could secure neither large BOFs nor any continuous casters.[31] After years of indecision, the Vizag plant was finally completed at double the investment norm. The feasibility report for Vizag was prepared in 1971 and the Detailed Project Report in 1977, but actual construction did not begin until the mid-1980s. The 3.0 million expansion stage of the Vizag plant was completed in the mid-1990s. Its product mix of low value billets, bars, structurals, and wire rods is, commercially-speaking, quite inappropriate for a capital-intensive integrated process. It is apparent that the project was hastily conceived, despite years of bureaucratic wrangling.[32]

Like SIDERBRAS, the Indian state-holding company, SAIL, suffered from poor project management and commercial planning. SAIL has been profitable, as measured by net profit (after depreciation and interest but before taxes). However, its accumulated end-of-year balance, including adjustments made for dissolved companies, has been consistently negative during the 1972-86 period [Steel Authority of India Limited 1987a:25]. Between 1982 and 1984 the company racked up net losses of over Rs 3 billion. SAIL's internal resource position has been precarious. The problem has been exacerbated as government commitment for

steel investments has been waning.[33] In the Seventh Five-Year Plan (1985-90), only 1.84 per cent of the total plan outlay was devoted to steel [Pingle 1996:229], representing only 25 per cent of estimated required funds (personal interview, SAIL, New Delhi, July 1987). A price hike was the only way that SAIL could redress its financial predicament (personal interview, Joint Plant Committee, New Delhi, July 1987), undermining the very mechanism by which state-led capital accumulation was to take place.

In contrast, the Korean steel company had an annual average 233.85 billion won (nearly $ 300 million) net earnings after taxes during the decade beginning in 1986. POSCO's return on assets, though low, has been positive, reflecting on the one hand modern plant and equipment and on the other maintenance of lower prices for the larger accumulation process. Its internal resources have been large enough to maintain a fairly high rate of investment. From 1992 to 1996, POSCO invested a total of $ 10.69 billion (at won 800/$), or an annual average of $ 2.13 billion (personal communication, POSCO, December 1997). In the same period, the Korean industry as a whole invested twice as much as POSCO.

V
Technology Diffusion and Capability

Aside from institutional impediments that delay project planning and execution, low capacity utilisation also hampers the learning process. However, technical difficulties arising from the adaptation of foreign technologies to local conditions can be a source for technological capability. With accumulated industrial experience technology diffusion can be expected to be speeded up. While the rate of investment can be the basis for learning, learning also depends on capacity utilisation [Ramamurti 1987]. Demand determines the rate of utilisation of plant and equipment. Plants designed with large economies of scale imply long production runs and hence greater susceptibility to utilisation rates. To maintain high rates of utilisation Brazilian and Korean plants have tapped domestic and export markets. Consequently their utilisation rates have been high, despite the cyclical nature of the steel industry. In most years Brazil had over 90 per cent utilisation rate, while Korea's POSCO had close to or over 100 per cent [Paine Webber 1987:Table 17; Innace and Dress 1992:250]. India's utilisation rates have been much lower, anywhere from under 40 per cent in the case of IISCO to over 90 per cent in Bokaro (Figure 2).

India's capacity utilisation has been low mainly due to deterioration of plant and equipment. Slackening demand had occasional effect as well. Capacity utilisation for Rourkela during 1959-60 to 1967-68 averaged only 67 per cent. Later, IISCO and Durgapur faced severe problems. Their combined capacity utilisation from 1974-75 to 1993-92 averaged 60 per cent [Steel Authority of India Limited 1994]. The state-owned Bhilai plant has consistently maintained high utilisation rates, whereas the public sector as a whole and the state-owned Durgapur plant have faced considerable difficulties (Figure 2). India's actual production has sharply deviated from the rated capacity. Whereas the Detailed Project Report capacity refers to the installed capacity as stated in the project report it is often an engineering artifact. The age of these plants, inadequate technological upgrading, their reliance on poor quality raw materials, and inadequate maintenance have rendered them incapable of achieving a high utilisation of designed capacity. Thus the rated capacity for Durgapur, Rourkela, and IISCO is questionable. Based on actual production, Durgapur's capacity prior to modernisation was less than 0.75 mt, Rourkela is 1.41 mt, and IISCO, a mere 0.37 mt [Steel Authority of India Limited 1994].

Not dogged by the institutional incapacity of the Indian state-owned industry, the private steel firm TISCO performed much better commercially. Technologically, however, it faced similar problems of plant and equipment obsolescence, excess employment, and low productivity. Its commercial successes rested on its managerial autonomy but also on its participation in the state-led price cartel in a sheltered domestic market. It too faced technological fragmentation, with several small, ageing blast furnaces, and a steel melting shop using obsolete OHFs and more recent BOFs. After recent modernisation and upgrading of facilities both ingot casting and continuous casting coexist. Though the plant has averaged a high capacity utilisation of over 97 per cent [Steel Authority of India Limited 1994:28] and high profits [Krishna Moorthy 1984:172], its labour productivity is very low compared to the Brazilian and Korean averages. In 1992-93 its output per employee was only 65 tonnes per year.

The inability of Indian integrated plants to obtain maximum output from plant and equipment, among other things, is also dependent on periodic investment in modernisation. In the Indian case investment in the steel industry has been quite erratic. For the first three five-year plans (1951-66) investment funds allocated to the public sector steel plants increased dramatically [Steel Authority of India Limited 1987b:143, see also Table 2]. But with the fourth FYP onward the importance of the steel sector consistently diminished. In the Seventh FYP (1985-90) the share of total government outlays for the steel sector was a mere 1.8 per cent and 3.5 per cent of total plan outlays and total public sector outlays respectively. Most of these expenditures have been directed toward capacity expansion; only about 5 per cent has been spent on updating technology [Steel Authority of India Limited 1987b:144]. Korea, on the other hand, rapidly adopted large blast furnaces and opted for BOFs and continuous casting (Table 5).

In contrast, partly because of earlier entry and partly because of institutional incapacity, India was saddled with smaller blast furnaces, obsolete Bessemer and open hearth furnaces, and lagged significantly behind Korea and Brazil in continuous casting. Expansion and modernisation of plants took place in fits and starts with unremarkable industrial performance. For example, IISCO, established in 1939, used the Duplex-Bessemer and OH process. Until 1965-66 capacity utilisation averaged 90 per cent; recently it has been hovering around 40 per cent of the original. Although the Bessmer converters were phased out in 1988, thereby more than doubling capacity utilisation, the plant is technologically obsolete. Plans to modernise it have remained on paper for several years.

An international comparison of diffusion of modern technology, such as the BOF and CC, reveals that among the three late industrialising countries Korea's rate of diffusion has been the fastest. By 1975, over 93 per cent of Korea's integrated output as a share of non-electric furnace output was under the BOF, compared to Brazil's 58 per cent and India's 19 per cent. Since then Brazil has closed the gap with Korea, while India still lags behind. In 1995, both Brazil and Korea had 100 per cent integrated output under the BOF compared to India's 66 per cent. In continuous casting, Korea matched Japanese standards by 1990 with a 96 per cent ratio, while India had a paltry 22 per cent. Brazil narrowed the CC gap in the 1990s to nearly 72 per cent in 1996. India still lagged behind with only 34 per cent.

The inability to keep up with modern technologies was also compounded by learning difficulties [D'Costa 1998]. The

adoption of different processes from diverse sources, varying plant size, and institutional bottlenecks made building technological capability a challenging task. For example, the Rourkela blast furnaces took five years to reach the rated capacity [Krishna Moorthy 1984:92-94], whereas POSCO's first blast furnace took less than two years. The frequent changes in technical parameters of the equipment supplied by different foreign companies (particularly by the Soviet Union for three of the five state-owned integrated plants) resulted in fragmentation constituting varying vintages of capital equipment, belonging to different processes, of different sizes, and from different suppliers.[34] The gradual learning-by-doing by Indian firms accomplished in the last three decades was considerably reversed [D'Mello 1986:182]. POSCO's technology strategy has been quite different. It sourced similar types of equipment from the same supplier. Thus Davy McKee supplied POSCO with nearly all of its identical blast furnaces. The second phase expansion of Kwangyang was a virtual reproduction of phase one. It cut down on site preparation and eliminated any potential new problems that could have arisen with different plant and equipment. Capacity expansion based on duplicating modern facilities and repeating imports of similar equipment thus placed Korea's learning on a higher level.[35] The successive installation of similar-sized blast furnaces exhibit increasingly shorter learning cycles. For example, the second BF took two months to reach a 1,500 tonnes/day/m^3 tapping ratio compared to the third BF reaching nearly 2,000 tonnes in the same period.

Technological capability is also demonstrated by the extent of capacity 'stretching', that is, producing output that exceeds designed capacity [Dahlman and Westphal 1982]. Mastering technology, improving operating procedures, and reducing costs allowed both Brazil and Korea to exhibit various degrees of capacity stretching [Enos and Park 1988:190-207]. Among the three integrated plants in Brazil, USIMINAS was the most successful in stretching capacity and attaining the best productivity rates. In 1977 its output per employee per year of 261 tonnes exceeded US productivity of 255 [Dahlman 1978:6]. Similarly, in the early 1980s, Pohang's fourth phase expansion entailed capacity 'stretching' by 0.6 mt beyond the designed capacity of 3 mt. In the final phase of Kwangyang expansion, POSCO was able to add an additional 1.0 mt POSCO's overall 'incremental' output stood at over 2 mt (plant visit, Pohang, August 1995). This output did not require major expenses of capital equipment. Instead small steps such as decreasing tap to tap time from four minutes to one minute in steel-making shops, reducing ladle thickness to increase the size of the charge, and increasing the number of working days were behind this incremental change.

Technological capability is also enhanced by backward integration whereby local firms become important suppliers to the industry [Taniura 1986]. In the early stages of late industrialisation increasing local content is difficult. All three governments in the 1960s and 1970s established capital goods producing firms in the public and private sector. In India the Heavy Engineering Corporation (HEC), an East Bloc-aided project, was set up with the sole objective of supplying steel equipment. However, with continued imports of most steel-making equipment, HEC's technological capability was limited. With poor sales, HEC's worsening financial situation was exacerbated by its already weak technological foundation, undermining the very objective for which the government had set up the corporation.

For financial reasons, perfectly capable domestic firms are also unable to compete with foreign suppliers (personal interview, Acominas, Belo Horizonte, December 1987). In the mid-1980s when Acominas, Brazil's newest greenfield was constructed, the Brazilian state-owned equipment producer, USIMEC, was helplessly sidelined for want of long-term financing. Brazil has the technical skills for capital goods production but like India its learning process has been stunted because of external financing of plant and equipment. Brazil's local content ratio for engineering is very high for the production of steel-making equipment but very weak in the finishing equipment area. Of the 35 areas under five categories of finishing, Brazil has engineering capability in only six [Guerra et al 1989:57; de Oliveira 1989].

Korea, on the other hand, was able to increase its local content rapidly. For its Pohang Works, Stage I entailed over 1,19,000 foreign engineer hours, which by Stage III was reduced to 491 and by Stage IV, to zero. Value of local content was 12.5 per cent in Stage I, rising to 35 per cent in Stage IV [Kang 1994: 182]. Virtually all areas of planning, construction, and engineering could now be done by Koreans [Amsden 1989:309]. For Kwangyang, local participation was high. Fifteen firms representing 50 per cent of plant and equipment were involved [Pohang Iron and Steel Company 1987:2]. To ensure local technological capability for the future, POSCO insisted that foreign firms affiliate with domestic ones.

At the plant level, POSCO took several steps to ensure technological learning and high capacity utilisation. Enos and Park (1988:183-207) documented several cases of improvements in imported equipment design and operating procedures in POSCO's plants. Several innovations on the shop-floor were introduced. Two schemes introduced in POSCO's plants that contributed to learning were 'zero defects' and 'improvement proposal'. The former ensured strict quality control while the latter sought employee suggestions to enhance operating efficiency. Both schemes resulted in significant cost savings and productivity increases, ultimately allowing the assimilation of imported technology [see also Amsden 1990:26-27]. In-house training and overseas education in both technical and non-technical areas was provided for a vast number of POSCO's employees [Kang 1994:181]. During the 1970s and up to the mid-1980s, POSCO sent about 1,900 employees overseas for training [Paine Webber 1987: 1-3], with emphasis on general rather than specific training [Amsden 1989:210-11].[36]

In the 1990s, the Indian steel industry, confronted with the prospects of increased foreign competition, introduced a major suggestions scheme [Venkata Ratnam et al 1995:271-80]. By creating a multi-skilled workforce, the Indian steel industry has been trying to restructure on the lines of the Korean one [Venkata Ratnam 1995]. In 1992-93, the number of suggestions increased 20 times, resulting in savings of Rs 1,300 million. The Indian steel industry has extended its training programmes to cover more employees. During 1988-89 to 1992-93, the number of trainees more than doubled, while the number sent abroad almost tripled, from 282 to 757 [Sengupta 1995:78].

However, India's technological problems remain. While POSCO has been able to rely on its customers to improve products, by an extensive feedback system (plant visits, Pohang Coated Steel Company and Pohang Steel Industry Company, Pohang, August 1995), the Indian state-owned firm is unable to crack the domestic market in the face of rising competition. For example, Union Steel, using POSCO's hot rolled coil produces galvanised sheets, which are then used by Samsung Electronic Company for refrigerators. By using the product and providing feedback, POSCO has been able to make better hot rolled coils. In the

Indian case, the successful Maruti-Suzuki automobile joint venture between the government and Suzuki Motors of Japan does not source steel for auto panels from Indian plants. Instead all pressed steel has been supplied by Japan (personal interview, Maruti Udyog, Gurgaon and New Delhi, July 1987, July 1991). The fact that state-owned domestic steel industry is unable to produce the quality steel required by a state-owned auto firm, reflects not only an institutional weakness but highlights the state of technology in existing plants.[37]

The emphasis on technological capability is further revealed by POSCO's investments in R and D. In 1977, 1.13 billion won was spent on R and D, representing 7.3 per cent of POSCO's profits [Enos and Park 1988:210]. In 1983 the corresponding figures were 9.78 billion won and 12.5 per cent or roughly $ 12 million. Though far short of Japanese norm of around 2.5 per cent of total sales, POSCO in the 1990s has doubled its spending from 1 to 2 per cent of sales. This norm far exceeds India's share of under 0.5 per cent [Sengupta 1995:80].[38] For Korea, the immediate impact of R and D has been declining royalty payments. In the case of Pohang, royalty payments for construction and operating technology declined by 6.5 per cent, 17.2 per cent, and 100 per cent in the second, third, and fourth stages of construction [Enos and Park 1988:189]. These reductions are remarkable considering that each phase involved increasing size and complexity of hardware.

To add more muscle to its technological capability, POSCO established the Pohang Institute of Science and Technology (POSTECH), patterned loosely after the Massachusetts Institute of Technology and the California Institute of Technology. It includes all engineering and instrumentation fields relevant to iron and steel making (plant visit, Pohang October 1987; POSTECH Prospectus 1991-92, POSTECH visit, Pohang August 1995). In 1987 the Research Institute of Industrial Science and Technology (RIST) was established to develop new technologies. POSTECH and RIST train technical graduates and act as a source for innovation for Korean industry as a whole. POSTECH can be seen as providing a collective good as its training of high skilled labour benefits other related industries.[39] In 1994 and 1995 POSCO also founded two overseas research centres – POSCO Tokyo Research Laboratories and POSCO Research Centre Europe in Dusseldorf, Germany. They have been established for conducting research in core technologies as well as for sourcing technical information.

The cycle of technological capability is complete when the technology importer ultimately becomes a technology exporter. In this regard South Korea is still weak in design capability [Chudnovsky et al 1983; Chudnovsky 1986; Griffin 1991]. However, as a result of its emphasis on technological learning and its success in mastering the engineering processes, POSCO has made some forays into technology supplies. Training of Taiwanese personnel from China Steel, installing a computerised system in Indonesia, and setting up a joint-venture with US Steel in California are examples of reverse flow of technology from POSCO [D'Costa 1993]. Foreign technology manufacturers are also engaged in the production of steel hardware using Korean skilled workers and local equipment suppliers. Several Korean firms are subcontracted to design steel equipment, such as continuous casters, on behalf of foreign firms.

VI
Conclusion

In examining state-led industrialisation, we find that in Brazil and India there have been institutional impediments to technological dynamism. While both countries have been successful in establishing and expanding steel-making capacity, thus contributing to the general shift in global production capacity, they have not been able to match Korea's investment momentum. Technologically their industries have not been as robust as Korea's. Although early entry to the steel industry may have contributed to the retarded development of the industry, the problems with more recent steel projects in both Brazil and India indicate otherwise. Timing of investments was important for Korea only to the extent that the Korean state had such an opportunity. But exploiting windows of opportunity in its external environment, such as the competitive technology market, was clearly a product of strategic intervention. The autonomy of the state, which was also extended to POSCO, definitely played a role in capturing the benefits of changing technologies. All three countries had some variant of industrial policy but only Korea could use it to build a technologically superior industry. Brazil and India did not have the institutional capacity to invest in modern technology. An overtly bureaucratic approach to industrial governance and populist policies, such as employment creation limited the development of the Brazilian and Indian state-owned steel industries.

State-ownership guaranteed capacity build-up in all three countries but ensured rapid industrial change only in Korea because of its ability to maintain an investment momentum and thereby continuously take advantage of new innovations. The effective utilisation of imported technologies contributed to local technological capability. However, the state, in attempting to foster capitalist development, could not act like a capitalist. Prices had to be kept low to develop downstream activities. Capitalist regulation required state initiative to develop an industry that would provide a key industrial input at controlled prices. The problem with this approach for capitalist development has been the inability of state-owned firms to generate internal resources and secure modern technologies on a continuing basis. India fared the worst because of the heaviness of the state sector. Low administered prices effectively subsidised a bloating public sector, serving private capital less than the downstream industries under government tutelage. Heavy losses of the state-owned public sector reduced internal savings and thus reduced investments in the industry. Technological obsolescence in India has been rampant and only recently has the government announced investments in the sector. The uneven adoption of innovations created a technological gap even among the three industrialising countries.

The implications of the uneven diffusion of technology are many. Four points are worth noting. First, different technological trajectories arise principally because of strategic choice and institutional capability. The US, Japan, and Korea can be seen as dictating the direction of industrial change – the US and more recently Japan toward reducing capacity and reorganising the rest in various ways, Korea and previously Japan by adding technologically-superior steel-making capacity at a rapid rate. Both Brazil and India attempted to transform the industry with limited success. Second, strategic choice and institutional capability are interdependent. Without a coherent institutional arrangement, such as state autonomy the Indian industry could not formulate a technology strategy let alone keep abreast of recent innovations. Third, past strategies and institutional impediments could induce new institutional arrangements, such as a greater state role in the US when falling behind technologically or an increased role of the private sector in Brazil and India as they too find keeping up with innovations challenging. Finally, both innovative behaviour and institutional capability are necessary to organise capitalist

production. One without the other is likely to diffuse technology unevenly, leading to changing competitiveness and varying rates of industrial transformation.

Notes

1 The entrepreneur Jamshed Tata, the founder of Tata Iron and Steel Company (TISCO) failed to raise capital in London at the turn of the century but could do so later in India itself [Etienne et al 1992:49].

2 The sectoral distribution of uncoated flat products, items produced by the state-owned enterprises, shows that 21.4 per cent of 1986 output was absorbed by the transportation sector [Instituto Brasileiro Siderurgica 1987: 2/4]. Close to 20 per cent of total output of this product is directly related to vehicle production [Instituto Brasileiro Siderurgica 1987: 2/6]. In 1995 the Brazilian auto industry absorbed 14 per cent of total domestic sales, representing 23 per cent of flat products [Instituto Brasileiro Siderurgica 1996: 2/4-2/5]. Though privatised in the 1990s, the suppliers of these products are the erstwhile state-owned firms.

3 The creation of Auto Latina in the 1980s by Volkswagen, Ford, and GM testifies to this influence. In 1987 the Brazilian government imposed price ceilings on automobiles, which VW and others blatantly defied. The government threatened to sue the offending parties but later withdrew the charges.

4 Typically in a monopoly situation price gouging is routine and the dependence of steel users on steel producers exceptionally high. This dependence was echoed by one major customer of POSCO (personal interview, Union Steel, Pusan, October 1987). However, it appears it had less to do with high prices and more to do with supply rationing during boom periods

5 For example, in Korea, the construction industry (itself an indicator of infrastructural development) comprised over 50 per cent of domestic demand while automobiles, machinery and the appliance industries have increasingly absorbed remaining steel output. With 1980 as the base, the index of steel consuming sectors in June 1987 were as follows: total manufacturing 454.5, metal products 275.6, machinery 531.7, electrical machinery 602.1, and transportation equipment 374.3 [Korea Iron and Steel Association 1987:55, 57].

6 Percival Farquar, a Brazilian entrepreneur, attempted to set up a large-scale, coke-based steel mill prior to World War I. However, regional and international politics, and the reluctance of foreign finance to 'disturb established markets' thwarted such a venture [Dahlman 1978:35].

7 In addition, US Steel feared nationalisation of productive investments in Brazil as it had recently lost its nickel operation in Finland because of Russian invasion.

8 Korea also faced a similar hurdle at a later date. In the Indian case, the World Bank did agree to provide funds for the private sector plant expansion on the condition that the Indian government underwrite these loans [Krishna Moorthy 1984:86]. In the mid-1950s and early 1960s the World Bank extended a loan of $ 127.5 million to the private integrated companies [Liedholm 1972:20].

9 The Soviet Union declined to offer BOFs for the Bhilai plant as the technology in the Soviet Union was still unproven, a response which paradoxically bore significant affinity to US industry's technology strategy.

10 One is reminded of the difficulties the Japanese faced with German know-how for the turn-of-the-century Yawata Works: cost overruns were five-fold and the design faulty [Morris-Suzuki 1994:80].

11 When the state of Minas Gerais learned of federal state involvement in the COSIPA plant located in Sao Paulo state, it too demanded one, leading to the creation of USIMINAS. The rivalry between the two states is legendary.

12 The Korean company, unlike USIMINAS, rejected the initial Japanese offer of small blast furnaces. However, given Japan's growing industrial might, Korea was not perceived to be an economic threat. As a result the Japanese also treated the Pohang project as a public relations opportunity.

13 Dasturco, an Indian consulting firm, and US Steel, at the request of US Agency for International Development, prepared the feasibility reports for the Bokaro plant. There were differences in the engineering details and break-even points in the two reports. The Soviet Union rejected Dasturco's project report and prepared a new Detailed Project Report. The Soviet cost estimates were nearly twice as high as Dasturco's. The Indian government accepted the report without further scrutiny and the Soviet Union, as a token gesture, reduced the estimated 'excess' cost by 5 per cent. However, this time the Soviet Union offered BOFs, which were smaller than the industry standard, but shied away from continuous casters for the plant.

14 This plant technically does not fall under SAIL management, the holding company for state-owned plants. As execution of a steel project requires large doses of investment capital, according to a SAIL staff, it is preferable to have the project directly under the control of the ministry of steel. Multiple centres for project execution is another sign of institutional incoherence.

15 Import content based on FOB prices has been estimated to vary from 22.9 per cent for the first stage steel melting shop (BOFs and CCs) to 69.9 per cent for the blast furnace [D'Mello 1986: 183].

16 In the course of an interview, a Nippon Steel staff lamented that as of October 1987 there were no major orders for equipment (personal interview with Nippon Steel, Tokyo, October 1987).

17 Some authors, such as Trebat (1983: 96-98) rated SIDERBRAS as highly autonomous. This is doubtful given the disastrous financial position of the company by the end of the 1980s.

18 Construction cost can be roughly disaggregated into site preparation costs, cost of equipment and associated internal infrastructure, external infrastructural development expenditures, manpower training, and interest payments during the period of construction for borrowed capital. Infrastructure development can be divided into three levels: plant offices, laboratories, maintenance and machine shops, warehouses, etc; housing, energy supply (not production), water system, road/railways, etc; and energy production, upstream activities, harbors, etc. [Astier 1985:5-9]. The final expenditure on a steel plant can escalate significantly if there are delays in decision-making, financing and equipment, as well as currency fluctuations.

19 Of the total investment of won 1,649.4 billion for Kwangyang's 2.7 mt capacity, $ 479 million was obtained as foreign credits [Pohang Iron and Steel Company 1987:3-4]. About $ 200 million was 'saved' because of fierce bidding among equipment suppliers [Paine Webber 1985:1-6] and roughly $ 38 million was to be paid as compensation to Kwangyang village [Paine Webber 1985: 2-6]. POSCO proudly declared that its investment cost of $ 637/tonne was less than 43 per cent of the standard $ 1,500/tonne cost in the world economy [Pohang Iron and Steel Company 1987:6]. But infrastructural expenditures on roads and harbors for Kwangyang incurred by several governmental agencies have not been included in POSCO's figures.

20 It is doubtful that the volume of exports of iron ore from the region is equal to the imports of coking coal for the plant. Thus the location of the plant justified on the basis of transportation costs is questionable.

21 The new plate mill in the Bhilai plant was installed at a time when the demand for the product was quite weak.

22 With the recent depreciation of the Korean won, POSCO's asset value is likely to be considerably lower. However, technologically POSCO is solid and hence its market value may be understated.

23 SAIL is over 95 per cent unionised under 220 unions and officer associations nationwide [Venkata Ratnam et al 1995: 260].

24 During expansion of capacity when workers are engaged in construction work for several years they are likely to demand permanent employment. The wage between regular and contract workers is significantly different with the contract workers entitled to a minimum wage with no benefits. But it is public knowledge that a portion of the minimum wage is pocketed by unscrupulous contractors.

25 In the past the ministry of labour firmly controlled all prominent unions of Brazil. All activities of unions were subordinated to the 'national' interest through the Consolidated Labor Laws (CLT) of 1943. In the event of a perceived threat to national interest the ministry of labour had jurisdiction to take over the administration of the unions by dismissing elected officers and replacing them by state appointees. Workers annually contributed a day's worth of wages to the ministry of labour, which was redistributed to unions on the basis of membership. Since total workers exceeded the number of union members in a specific industrial branch and as the funds were used for the benefit of union members only there was no incentive to recruit more members [Keck 1984:27]. Under no circumstances could these monies be used as a strike fund.

26 During 1955-60, the average number of work stoppages numbered 79, during the 1963-71 period the average dropped to 15 [Deyo 1987: 186]. The 1986-89 the average was nearly

1,900 as workers became increasingly aware of their rights and their solid contribution to the Korean economy [Im 1992:17].

7 From 1977 to 1986, the average number of hours worked per week in Korea was consistently over 52 and increased nearly 4 per cent during this period [International Labour Organisation 1987]. Women workers have worked even harder in the manufacturing sector. In the iron and steel industry, South Korean workers on the average have worked nearly 40 per cent more than their Japanese counterparts. See also Chakravarty (1987) for a discussion of the relationship between number of hours worked and capital accumulation.

Poor countries are particularly vulnerable to such institutional weaknesses. For example, Bangladesh in 1967 received Japanese assistance to set up a steel mill on a turnkey basis. Three 60 tonnes OHFs were supplied with a capacity of 1,50,000 tonnes. Later, another OHF was added and the 'designed' capacity raised to 2,50,000 tonnes. The plant never attained more than 1,35,000 tonnes. It is ludicrous to imagine how a single 60-tonnes OHF could produce 1,00,000 tonnes when three of them were designed to produce 1,50,000 tonnes [Mujtahid 1997:2]. This is clearly an example of recycling obsolete technology by the Japanese, imposing a form of structural dependence, and the institutional and technological incompetence of the local authorities

For the initial loan of $ 700 million, the repayment period was six years and interest at Libor (London Interbank Offer Rate) plus 1.25-1.375 spread [CST 1985:14] Although loans from domestic sources carried repayment periods of 16-132 months at 5.5-10.5 per cent there was little capital equipment bought from domestic sources The high cost of the plant along with domestic price controls added to the financial burden, compelling the Kawasaki Steel Group and the Finsider Group to reduce their voting stock to about 5.25 per cent [*Metal Bulletin*, January 18, 1988:27].

Interestingly, CST initially had a lease-back agreement on its coal yard and coke batteries, which ultimately had to be bought with cash with the help of Japanese banks. It may be recalled that the Japanese-aided USIMINAS also experienced cost overruns. In 1982 USIMINAS unsuccessfully tried to sell bonds worth $ 43 million to the Japanese. The Japanese did not perceive the rate of return to be adequate.

It is not that Indian planners and engineers were not aware of the technological possibilities. In fact Dastur and Company, the Indian steel consultants, had recommended 200-300 ton BOFs and requested continuous casters. Instead the Bokaro plant obtained 100 ton BOFs and no CC [Lall 1987:86].

It may be mentioned that site selection has been partly influenced by a major agitation in 1966 in Vishakapatnam, demanding that a steel plant be located there. Another integrated plant to have been built in Paradeep on the eastern coast involved several negotiations with suppliers, particularly British and West German, with various terms and conditions that were frequently revised. This was at a time when the advanced capitalist countries were undergoing a severe recession. No technical study was conducted and ultimately the site proved to be unsuitable.

33 Of the six integrated plants in the country, only Bhilai of SAIL and TISCO, the privately owned plant, have been profitable. Only since 1985-86 has the Bokaro plant earned a large enough profit to wipe out its accumulated losses. The two plants with the worst record have been Durgapur and IISCO in the state of West Bengal. The performance of these two plants has been so poor that the accumulated losses now exceed the value of capital assets employed. Production could continue only with subsidies. It was politically infeasible to write off these plants.

34 Local content in plant construction increased from 34 per cent in 1961 for the first three 1.0 mt plants to 64 per cent in 1978 and 90 per cent in 1988 for Bokaro's first and second stages respectively [Kojima 1991:6]. TISCO's local content achievements were similar to those of Bokaro.

35 POSCO obtained the normal rate of output from its first blast furnace in 107 days, six months earlier than what the Japanese had anticipated from their experience [Kang 1994:184-85] Designed capacity was easily exceeded after the fourth month. Similarly, the time taken to attain normal capacity from start-up became shorter – 80 days for the second blast furnace, 70 for the third, and 29 for the fourth For Kwangyang's first blast furnace it was only 23 days

36 Typically, new employees attend high schools to cover technical and steel related subjects. Technicians and other skilled workers who operate equipment are generally recruited with engineering qualifications and are given a combination of several years of plant-specific experience and training by foreign suppliers. Other more skill-demanding activities such as incremental improvements in technology, purchasing of foreign equipment, and designing process and products require additional years of experience [Enos 1991:81].

37 Since annual Indian vehicle production is still low, the production of high quality auto sheets may not be feasible due to economies of scale requirements However, this reasoning does not take into account the possibility of enlarging markets by exporting

38 TISCO, with a third of SAIL's production exceeded SAIL's R and D spending of Rs 5 22 billion by Rs 1.7 billion.

39 Enos and Park (1988, 210-11) show that many employees who quit POSCO subsequently work for Korean firms that are also suppliers to POSCO. In this sense one can speak of diffusion of skills, with POSCO a leading centre for human capital development

Competing through Capabilities

Strategies for Global Competitiveness of Indian Textile Industry

Pankaj Chandra

The global textile trading regime is going to change drastically from the year 2005 with the phase-out of MFA. Its implication for competition will be significant. Countries that have already put competition policies in place and firms that have been improving their capabilities are the ones that are going to benefit the most. This paper discusses the nature of competition that Indian textile firms are going to face domestically and abroad in a few years from now. Some of the characteristics of competitive firms that will emerge in the ensuing period are indicated. The paper presents a summary of comparison of Indian primary textile firms with those of China and Canada (based on a primary plant level survey in the three countries). In addition, some processes that are helping the Chinese textile industry grow rapidly are discussed. It is argued that competitiveness of Indian firms would be contingent on developing long-term distinctive capabilities. Three key strategies, namely, Commitment, Co-ordination and Co-operation, for developing distinctive capabilities are presented and illustrations of initiatives at the firm level, industry level and the government level that would form part of the implementation package for each strategy are provided.

I
Introduction

DOES the phase-out of MFA on January 1, 2005 not mean that the Indian textile industry will be able to increase its global market share? Does the cost advantage that Indian firms have not imply a continuing comparative advantage? Do Indian firms have an advantage while supplying the home market because of better understanding of and proximity to the market? Are there distinctive competencies that firms need to have in order to remain competitive in the future? Is technology investment a sufficient condition for sustaining growth in the sector? These are some of the many issues that need to be addressed in assessing the competitiveness of the Indian primary textile industry and in designing strategies for meeting the challenges in the post-MFA period. What is quite clear is that, since the nature of competition will change dramatically, firms will have to evolve newer strategies that are based on contingent strengths and long-term perspectives. In this paper we argue that only those firms that develop unique capabilities will qualify to compete in the global textile markets.

The global market share by value of the Indian primary textiles hovers around 2.8 per cent (as of 1996) as compared to 12.5 per cent of China. Countries like Korea (with a market share of 5.6 per cent) and Taiwan (5 per cent) are ahead of India while Turkey (2.75 per cent) has caught up and others like Thailand (2.3 per cent) and Indonesia (2.0 per cent) are catching up rather quickly. On the one hand, technology which has become a commodity has changed drastically in this century alone with spinning speeds having increased 25 times and weaving speeds having increased 20 times [Hartmann 1997]. On the other trade blocks around the world have created their own 'captive low cost production zones': Turkey, Hungary, Poland and Czech Republic in EU; Mexico, Honduras and Caribbean in NAFTA; and Vietnam, Laos, and Cambodia in the ASEAN. Factor advantage is shifting away from traditional low cost countries. Firms in these countries are gradually moving up the product complexity ladder and are finding new sources of innovation, chiefly new applications and enhanced processes. The spinning sector in India has performed extremely well in the last four years – it is expected that the world market share would touch 30 per cent by the end of 1997. Most of this impressive performance has come through large-scale investments in new ring spinning machines – in 1996, of the total of such new machines purchased around the world, 52.6 per cent was procured by India [Strolz 1997]. It is interesting to note that the recent devaluation of the baht in Thailand and the rupiah in Indonesia have led to drastic lowering of yarn prices, and spinners in India are struggling to recover their costs. With inventories sitting in warehouses and the interest-clock ticking on capital investments (most often made in foreign currency), it would be a while before our spinning industry starts to recover. This begs a question: what are some distinctive capabilities that these firms have developed other than technology (that is already a commodity) which will ensure that firms are able to withstand the increasing uncertainties of global markets? And more important, how do firms develop such competencies? Are there certain industrial practices that help firms manage such uncertainties with relative ease ?

In this paper we argue that firms in the Indian primary textile industry will have to develop some distinctive capabilities to compete in the future once the Agreement on Textiles and Clothing (ATC) expires. In the next section, we present the emerging competitive scenario and highlight the nature of competition that Indian firms are going to face. In section III we present a summary of the findings of a multination benchmarking study that establishes the operational status of Indian textile industry. In section IV, we present some salient features of practices from the Chinese textile industry and the impact that they have had on industry performance. In section V, we develop a framework for 'capability based competitiveness' and discuss key strategies towards building distinctive capabilities. We also point towards the role of textile policy in assisting such efforts. We present our conclusions in the last section.

II
Competitive Scenario

When MFA expires on December 31, 2004, most of the product categories in which north America and Europe compete would have already seen free trade for at least a year while those which are crucial for Indian exports would then get off-quota. One implication of this back-loading agreement would be that Indian firms may start to see increased domestic competition from foreign firms in about two years time from now. They will face imports from

other countries as well as entry of MNCs in existing domestic product segments as well, in addition to preparing for export markets that would open up in 2005. These new firms will also bring in new products to the domestic markets. The competitive environment is poised to change in several other ways as well, e g,

– new products will replace some of the existing mix thereby affecting capacities of domestic firms;

– increase in variety with a considerable reduction in volume per variety; a study of the textile firms in the US by Abernathy et al (1995) reveals that the average number of SKUs per business unit increased from 6,411 in 1988 to 13,261 in 1992 and that in 1992 firms on the average introduced 7,257 new SKUs while they dropped from the product line, on the average, 5,788 SKUs;

– several countries will have upgraded their technology stock with latest versions by the year 2005; for example, Turkey has been the largest investor in open-end rotor in 1996;

– strong productivity increases by firms in north America and Europe; for example, Unify Inc, a spinning firm in the US has tripled its sales since 1988 to US$1.7bn and most of addition in capacity has come through process improvements and not capital investments (McCurry, 1997);

– stronger environment requirements both from the citizens as well as the legislature; the process industry is already penalised for not treating its effluents responsibly; pressures will also come from international consumer groups to adopt processes that do not generate polluting effluents;

Firms around the world have developed different kinds of capabilities that have allowed them to perform well in the face of severe competition. In the long run, a competition between firms is a 'contest of competencies'. Firms whose competencies are more robust and more distinctive tend to gain more than others. Examples of such competencies are given below. What is worth noting is that it would be firms with these type of capabilities who would compete with Indian firms both in the domestic and international markets in few years from now. Some examples of how firms around the world have been changing are:

– In Prato, Italy, large mills have disintegrated to form a cluster of smaller firms that specialise in a single process. They compete on end products and collaborate on technology development and infrastructure maintenance. The output of this cluster and the variety produced has increased manifold since this 'graceful disintegration'.

– German manufacturers have implemented 'lights out' weaving for 24 hours where weaving machines have been loaded with weft packages just before shutdown on Sundays and computers adjust weaving speeds to optimise yarn speeds.

– Japanese and American plants are using TQM practices like Design of Experiments for optimising weaving practices.

– In Indonesia, one operator works 48 looms and shares the profits stemming from them.

– Burlingtons in the US have reduced manufacturing and delivery lead times 200 per cent in the last five years and in-plant defect rates are now measured in parts per million.

– Firms in southern USA are researching the use of genetic engineering, cellular biology and tissue culture to grow coloured cotton in order to eliminate the dyeing process.

– Firms are using 'looming robots' to setup looms, load and unload them and to transport the cloth to the stock room.

References on the above and details are documented in Chandra (1998). Successful firms are changing their technology stock and the organisational structure that uses this technology simultaneously. The former includes updating machinery, plant infrastructure, transport and handling equipment, storage facilities, process control, ventilation and environment control systems, effluent generation and treatment systems, etc. The latter includes reporting and communication structures, manufacturing management practices, data collection and planning mechanisms, training and evaluation, grievance handling process, process and product innovation, subcontracting networks etc. It is now well established that firms that pursue technological change along with organisational changes get maximum advantage of investment in technology. In other words, technology (or codified knowledge) that is not developed in-house is accessible to all competitors and it does not provide a distinctive advantage to a firm. However, managerial practices (or tacit knowledge) that are uniquely designed to take advantage of technology can be copied less easily and hence provides competitive advantage. Toyota's development and implementation of the JIT is one such example. In textile industry, these managerial practices form the important link between technology adoption and competitiveness. The key issue is the ability of firms to increase their productivity between two epochs of technology acquisition.

Manufacturing management has played a critical role in linking technology with competitiveness. It requires (a) development of an effective work environment, (b) emphasis on capability building process (of both people and technology) and (c) a mechanism for evaluating the performance of the manufacturing regime. The reader is referred to Chandra et al (1998) for a literature review and discussion on each of these factors. Gold (1997) mentions that recent industrial experience from US suggests that extensive advertising/marketing, take-overs of competitors by firms have provided only short-term profitability and competitiveness. His study

* We have "islands of excellence"

shows that the two most consistent sources of improved competitiveness have been "increasing the performance capabilities of the products, and offering more favourable product prices for comparable products". Improving the basic technology on which the product design and its performance is based, improving the quality and mix of materials (raw material or intermediate products) and advances in effectiveness and quality of the manufacturing operations are seen by Gold as the three key sources for achieving the above. They also shape the long-term capabilities of any firm.

In the next section we report some findings from a benchmarking study to assess the capabilities of the Indian primary textile industry based on the above discussion. These findings will highlight how well, on the average, our firms are prepared to meet the competition from firms that have characteristics described above.

III
Benchmarking Indian Primary Textile Industry

In this section we describe the findings of a plant-level, cross-country study to benchmark the capabilities of firms on a variety of operational parameters. This was a collaborative study between the Indian Institute of Management, Ahmedabad, McGill University, Montreal and Renmin University, Beijing. Primary data was collected from 173 plants in Canada, China and India through a standardised questionnaire and detailed interviews were conducted with managers at several of these plants. Indian firms have been compared with Chinese (representing a high growth country in terms of global market share) and Canadian (a proxy for high productivity oriented north American firms) firms. The sample comprised of composite mills as well as firms that performed one or more of the spinning, weaving and dyeing, and finishing operations. Most firms were medium to large in size (in terms of employment and sales). A large majority of firms were profitable and care was taken that each country sample included a representative proportion of firms that were performing well in global markets. Information from various trade journals were used to identify such firms. Similarly, the sample also included a few firms who focused on domestic markets only but were successful in terms of sales turnover.

A sample of these findings is reported in Table 1. The numbers in the table represent an index giving a relative position of firms on a given factor as compared to the Canadian sector (whose index is taken as 100 for all factors). These comparative indices are based on raw data which is provided in Chandra et al (1998). The index value for a country on each parameter is determined by scaling the raw data on that parameter *vis-a-vis* the Canadian raw data and then representing it on a base of 100. For example, the index on the quality of work environment is based on actual data on wages, incentives for plant workers (e g, profit sharing, housing and transport, pay for knowledge, etc), worker motivation programme (e g, job rotation, flexible work schedules, employee suggestion programme, alcohol/drug abuse programme etc), type and frequency of grievances filed (e g, related to discipline and discharge, safety and health, overtime assignment, etc), nature and extent of training programmes, etc. Chandra et al have developed aggregate raw scores for each such factor. These scores were used to create our index. These findings represent 'average values' while outliers existed in each of the three country samples.

Table 1 is a representative sample of these comparisons. It may be noted that many of the observations that are made in the following paragraphs are based on data on specific factors that have been aggregated to give the indices that are shown in Table 1. Both Canadian and Chinese policy-makers have recognised

TABLE 2: SOME KEY CONCERNS OF INDIAN TEXTILE INDUSTRY

Operational
1 A large proportion of exports from the powerloom sector is in grey due to lack of good quality processing houses outside the mill sector:
2 Weak work culture – an worker in Indonesia can operate 48 looms at a time while in India it would be around 8;
3 Worker skills are very poor: dependence on agriculture worker: dependence on untrained women in the garments sector,
4 Poor ginning facilities;
5 Poor cotton agriculture practices;
6 Transportation, port and customs procedures are very lengthy, unclear, and cumbersome;
7 Long production cycle times and high inventories;

Structural
8 Garment exporters have to depend on the powerlooms (whose quality and reliability levels are low and reas mill sector is not able to supply in small volumes to small exporters;
9 Relationship of cotton growers, etc, with mills or spinners, etc, is short -term oriented;
10 Weak indigenous textile machinery sector especially those related to looms and processing,
11 Multiple agencies represent different entities of the supplier chain;

Strategic
12 Powerloom sector does not have resources to invest in new technology for quality improvement;
13 Interest rates are very high – firms find it risky to invest in new technology in addition to high pre-shipment and post-shipment export credit rates;
14 Indian exports are 80 per cent cotton based while world trade is shifting towards the use of synthetic fibre (75 per cent of world trade),
15 Entrepreneurs are very inward looking;
16 Water charges in Bombay are highest in the world – firms are unable to re-locate with the changing cost environment;
17 Entrepreneurs do not see themselves as part of a national industry – behaviour is short term and opportunistic,
18 Indian producers are competing with other Indian counterparts in the export markets; choice of product mix is based on orders and not so much on long-term capacities – are we competing in the same segment with similar products ?
19 Industry has not been able to forecast properly the demand for various product-market segments;
20. European and North. American producers are shifting production bases to Morocco, Tunisia, Portugal, Turkey, Mexico, Honduras, Czech Republic, Hungary and other low wage CIS countries;

Regulatory
21 Regulatory requirements· Hank yarn requirements, Essential Commodities Act, Excise, etc, have a detrimental effect on the competitiveness of firms;
22 Evasion of Excise, false branding, etc, by small-scale producers;
23 Synthetic fibre is very expensive in India due to a variety of duty and other restrictions:
24 Large units are not allowed in the garment sector until they export 75 per cent of their production: the country, however, will not be able to restrict imports of garments from large units;
25 Import of raw materials is restricted, at best;
26 Power availability is very irregular;
27 Cascading taxes and local levies are close to 10 per cent;
28 Duties, reservations and other structures imposed by the government are forcing people to cheat or behave in a manner which is un-economical in the long run; e g, fabric that is reserved for the handloom is actually coming from the powerlooms;
29 Non-tariff barriers to exports exist;
30 Devaluation of rupee will hurt in the long run until the domestic textile machinery industry is strengthened.

the importance of this sector to their respective economy and have developed targeted programmes (like the Programme to Enhance Productivity (PEP) in Canada) to improve productivity of their firms. It is apparent from the table that Indian firms have typically produced a large variety of counts which, on one hand reflects the flexibility at the plant level while on the other hand reflects a lack of strategic response at the firm level, i e, focusing on few products and developing capabilities to improve quality of both the product and the processes. Many firms in India continue to serve, profitably, the low end of the market. This has had two salient effects in conjunction with domestic protection: first, these firms have not graduated to producing and serving higher value added market segments: and second, they have not made efforts to introduce better products (at the same cost) to replace the low quality offerings. While there exist islands of excellence in firms like Arvind or Coats or Bombay Dyeing, etc, organisational practices within firms in the primary textile sector are often 'Dickensian'. It is not unusual to find firms where large-scale dyeing is still done manually (by hand) or where the humidity in loom rooms is unbearable or where the worker (as well as managers, at times) motivation is very low. Such plants are to be seen in China as well.

While the wage levels in India are low, those in China are almost half of those in India. When one factor lies in the quality of the workforce, the impact of wages on competitiveness decreases as the ability of the workforce to bring about sustained enhancement in productivity is limited. This is one of the reasons why Indian firms do not 'indulge' in any indigenous R and D (the average value is 0.2 per cent of sales) – more on this later. Interestingly, there now exists a market for innovation in China – periodically, innovators get-together and share/sell their innovation to firms. Many PSUs in China have a floating payroll system where the wage bill of a firm is pegged to a negotiated output level. This has been inducing certain amount of change in the internal environment of firms as many benefits have been linked with productivity. Most firms in Canada and some in China and India have recognised that in order to improve productivity of plants, workers must be treated fairly and that work environment must be healthy and safe.

McCurry (1997) points out that the textile worker, in times to come, cannot afford to remain un-educated as new technology demands new skills. He points that successful firms in the US are holding extensive education programmes for their workers and managers. For example, establishing process capability of machines has become necessary to control defects. This requires operators to plot statistical charts, interpret them and then modify process parameters accordingly. Many computer assisted machines generate and capture such performance data automatically. The ability of firms to use such a technolog (and consequently produce a value addin product mix) may, to a very large extent depend on the skill level of its workforce The relative lower quality of the technica workforce and the operators, as shown i Table 1, is directly linked with low investment in training by Indian firms. Similarly the technological capabilities of India firms are lower, on the average, as com

TABLE 3(A): DESIGN OF INITIATIVES TO DEVELOP DISTINCTIVE CAPABILITIES – COMMITMENT

Firm Level Initiatives
- Focus on Speed and Quality to Reduce Costs
- Product Mix Choices to be based on 'Real' Competencies in Operations
- Focus on Quality of Life of the Employee
- Extensive Education of Workforce
- Strategic Investment in Technology

Industry Level Initiatives
- Support Long-Term Textile Related Education Programmes
- Design Industry Policies
- Establish Textile Quality Council

Government Level Initiatives
- Establish Escrow Fund for Education in Textiles
- Remove Structural Impediments like Reservation
- Come up with a new Textile Policy focusing on year 2015

TABLE 3(B): DESIGN OF INITIATIVES TO DEVELOP DISTINCTIVE CAPABILITIES – CO-ORDINATION

Firm Level Initiatives
- Focus on Supply Chain Management
- Emphasise Excellence in Production – Housekeeping, Statistical Process Control, Shop Floo Synchronisation, Productive Maintenance and Value Engineering
- Map and Reduce Variability in the Operations (e g, reduce expediting)
- Move towards Pull Mode of Production
- Invest in New Technology that will keep you ahead for at least two years
- Increase Use of Computers

Industry Level Initiatives
- Spread Good Manufacturing Practices
- Identify Weak Links like Processing Houses and help upgrade technology
- Invest in an Advanced Technology Centre that holds regular displays of new textile technology from all over the world
- Co-ordinate Flow of Goods and Information between different Cotton farms, ginneries, spinners, weavers, processors and garment producers via EDI technology, etc.
- Develop an Independent Certification Agency

Government Level Initiative
- Remove Restrictions on Availability of Domestic and Imported Raw Materials
- Need to re-organise the Textile Ministry to include all elements of the Supply Chain – remov Inter-Sectoral Policy Distortions
- Need to Strengthen Domestic Textile Machinery Industry
- Provide Tax Benefits to small and medium firms that are investing, in say, quality improvement rather than organising seminars for them

TABLE 3(C): DESIGN OF INITIATIVES TO DEVELOP DISTINCTIVE CAPABILITIES – CO-OPERATION

Firm Level Initiatives
- Strategic Alliances between Indian Firms on Technology Development, Pre-Competitive R and D, Infrastructure, Funds Availability, etc
- Strategic Partnership with Other Entities in the Supply Chain
- Co-operation between small/medium and large firms: Formation of Central-Satellite Firm (CSF) Network – reduction of risk for small and medium firms and increase in flexibility for the large firms
- Investment in R and D up to at least 2 per cent of Sales

Industry Level Initiatives
- Help Firms develop a CSF network – selling the idea to firms that they will survive only i they co-operate
- Facilitate shifting of competition from between firms to between various CSF Networks - initiate the partnering process
- Transform into a single Integrated Textile Industry Association

Government Level Initiatives
- Float Partnership Program for Pre-Competitive Product Development
- Tax Benefits for Patents Obtained and Income from Patents made Tax Free

pared to those in Canada or China. Most investments in India, in recent years, has been in spinning units. However, 65 per cent of spinning machinery is still more than 10 years old as compared to 90 per cent in Italy which has the most modern spinning sector [Strolz 1997]. The picture in weaving and dyeing and finishing processes is much worse. China invested in 68,000 shuttle-less looms between 1987 and 1996 as compared to 8,000 in India or 30,000 in Indonesia or 81,000 in Korea. It is estimated that half of the 3.6 million shuttle looms around the world are in India [Strolz 1997]. There is a noticeable absence of adequate capacity in good quality dyeing and finishing processes. These two processes limit the entry of Indian textiles into higher value products despite a modern spinning sector.

Some other challenges that the Indian primary textile firms will have to overcome can be classified as (a) operational, (b) structural, and (c) strategic. *Operational challenges* include reducing manufacturing and delivery lead times, improving product and process quality and improving plant and equipment maintenance. Chandra et al (1998) show that production cycle times in Indian plants are almost twice those in Hong Kong or Korea. Specifically, production run sizes are longer in Indian plants (across the three processes) as opposed to those in Canada thereby resulting in higher waiting times for a lot and, consequently, resulting in higher working process inventory. The average manufacturing and delivery lead times from procurement of yarn to shipment (ie, receipt by customer) for our apparel exports is between 144 to 182 days [Raman 1995]. This is often longer than an entire fashion season. Most firms do not follow any scientific approach to shop floor planning and control, thereby, leading to poor co-ordination between processes. Batches wait for days before they get processed at each machine due to non-synchronised order releases. Planning tools like MRP or JIT are almost non-existent in most Indian textile plants. There is lot of scope for improvement on these factors by introducing appropriate shop floor planning systems. For example, a good bale management system which allows proper combinations to be formed from various quality bales would go long ways to reduce waiting times and defect rates. (Interestingly, such a system can be set up at a central facility for common use). High defect rates (about 3-5 per cent in India, 1-3 per cent in China and 0.01-0.1 per cent in Canada) are another source of delay, in addition to increased costs. In fact, a recent survey of 300 spinning mills in 27 countries revealed that, of the 14 most contaminated varieties of cotton, 8 were from India [Strolz 1997]. Most quality problems stem from weak quality measurement and control systems. Moreover, spinning a poor quality cotton or weaving a poor quality yarn is wasting productive machine capacity. This calls for identifying and removing defects at source. Improving quality practices at the ginneries should be one of the most crucial items on the agenda of the textile industry. It can be easily shown that improvements in quality at this stage not only benefits the spinners but also the ginners via higher premiums on their product. The same can be said of poor housekeeping and weak plant and equipment maintenance systems in Indian plants. Healthy work environment (both for people and machines) is necessary for higher productivity. Best practices (for example, in world class plants one cannot enter a loom room without ear plugs) only add value in the long run. They help in attracting better customers, employees and suppliers.

Structural challenges include looking at the operations of the entire sector as a single entity. There is poor co-ordination between different entities that comprise the supply chain, like the cotton producers, ginners, spinners, weavers, dyers and finishers, knitters and apparel producers. There is still no recognition of the fact that they are interdependent in their growth. No longer are firms competing in global markets by themselves. When Benetton competes with Stefenal, it brings the strength of its own supply chain (ie, cotton farms with which it has special relationship, its 1000 or so small suppliers, its transport network, its franchises, etc) to the market. Benetton has linked its suppliers' low cost weaving skills with its own high quality dyeing resources to deliver orders at short lead times and at low cost. Ad hoc supply chains based on short-term advantages and poor co-ordination between various entities are resulting in delayed information and product flow between various entities. This is leading to high inventory level in Indian supply channels. This is corroborated by our survey which revealed that 36 per cent of Indian textile firms kept more than 75 days of RM inventory as opposed to an average of 11 per cent and 13 per cent of firms in China and Canada, respectively. Similarly, poor managerial practices and technology in the processing sector is limiting the ability of many yarn and cloth producers to climb up the quality and value added ladder.

Another challenge before the sector can be termed as *strategic* in nature. There are two aspects of this problem that are worth noting – first, there appears to be too much conflict between the small, medium and the large players in the industry. Composite mills or large plants lack flexibility to produce variety or small orders at low costs. Powerlooms/small plants have the flexibility due to low overheads but have outdated technologies and work practices to produce high quality products. In a market where garments have to be delivered quickly at low cost, a modern powerloom sector will be an asset but a reservation price of Rs 3 crore cannot buy even 20 Sulzer loom (and such investments may be required every 5-6 years to remain competitive). The second issue is related to the first – decisions on product mix choice and product markets are very local and short-term oriented which result in short-term gain at the cost of long-term effectiveness. As a tautology, technology choice decisions have been linked to this latter issue. Strategically, a plant cannot be both low cost producer as well as variety provider. Plants make choices on whether to focus on few products at high volumes or to produce a large variety at lower volumes per variety. This becomes necessary as for each type, design of operations, layouts, practices, processes, factors to focus on, etc, are different. Plants in India that have followed such an approach have done extremely well (e g, Arvind, Ashima, Modern, etc) but many others still believe in opportunistic market seeking which introduces inefficiency in operations.

In summary, there appears to be an overdependence on low wages and raw material costs as source of competitive advantage. The textile policy regime, protected environment, and certain historical factors have all contributed in making this sector very static and unresponsive to changes that have been happening around the world. Table 2 summarises some of these concerns though we have decided to focus on firm level strategies and responses (note: several of these concerns were highlighted during discussions at Texcon 97).

IV
What the Chinese Are Doing Right

Chinese textile industry is an interesting case study of how policy intervention, firm level changes, and strategic technology choices helped it to become an important player in the world market. It is important to point out that most of these changes have taken place over years and that the industry has been successively climbing up the value added ladder. While it is difficult to create a single visual of

these efforts, one can identify several factors that have contributed positively to the growth of the Chinese textile sector. As Wang (1998) points out that the 'four modernisation' programme in China after the Cultural Revolution recognised textiles as a key sector which could generate large amounts of foreign exchange which was necessary for investment in other sectors of the economy. As a result, the number of textile enterprises grew from 4,551 in 1978 to 11,242 in 1991. Together their current global market share is close to 26 per cent including both primary textiles and apparels.

The Chinese industry has followed a two-pronged strategy in building market share, i e, developing large volume/low cost units and low volume/high value adding units. This dual strategy has drawn Chinese expatriates from Hong Kong, Taiwan, Europe and the US who have played the role of 'market makers' as well as producers with factories in China. It must, however, be mentioned that the quality of the domestic market is far inferior to that of export markets and is thereby open to competition, just like India, after year 2004. In fact, the extent of competition in the domestic market is not as intense as one finds in India. Chinese policy has encouraged export-oriented units in a variety of ways that range from the availability of credit for buying new equipment to canalising raw materials and finished goods through centralised channels. This has helped in reducing uncertainty in availability of good quality material for exports. In addition, it has set up a single apex body for each of the sub-sectors in order to facilitate export formalities and to better co-ordinate across the sub-sectors. With implementation of the "responsibility system", pressures on most state enterprises has increased to perform, especially, since the wage bill has been linked to output levels. This has driven many firms to export as that was the only way to fund purchase of new technology through which they could increase their output and consequently their wages bills. Another pillar in this modernisation process has been technological upgradation. Since 1985, cotton and silk firms have imported equipment worth US$ 1bn each year [Wang 1998]. However, by the year 2000 only 20-25 per cent of the total technology stock would have been updated. (In 1992, 1.08 million cotton spindles and 18,000 looms were made obsolete and eliminated.) Another example of such investments has been the state-run Beijing No 3 Cotton Mill which has invested close to US$1bn in new equipment in the last ten years. Another feature of this growth has been a spate of joint ventures that each of these firms have entered with firms outside China – most of these firms produce to specifications provided by foreign partners.

There has been another facet of development in the Chinese textile industry which has provided a significant long-term benefit to individual firms. China does not have a long or strong history of managerial initiatives. However, its secondary and technical education programmes are very stringent. Chinese firms have recognised this lacunae and have started to invest in in-company training of its workforce in modern technology and managerial skills. On the average, Chinese textile firms give 70 hours of training each year to an experienced worker as opposed to 32 hours in Canada and 10 hours in India [Chandra et al 1998]. This survey also found that about 16 per cent of Indian firms did not provide any training to a new employee as compared to 1.8 per cent in China. To put these efforts in perspective, the training that a long-term auto worker gets as a new hire at Saturn's plant in the US is between 350 and 700 hours [Rubinstein et al 1993]. Chinese work-units on shop floor are increasingly making productivity-related decisions. Interestingly, the focus of all shop floor programmes or technology investments has been improvement of quality which is quite similar to that in India. Joint ventures have brought in new managerial practices which are helping firms upgrade their capabilities. The Chinese government has been anxious to enter new application areas in textiles and has set up a commercial R and D organisation, the Chinese Textile Science and Technology Development Corporation, to help develop new capabilities especially in industrial textiles. Finally, Hong Kong has been playing a key role in China's growth. It provides high quality design and apparel manufacturing and marketing services, efficient financial and shipping facilities that have considerably reduced delivery times, and plants that are capable of quick ramp up to meets customers' short delivery requirements. This network of low cost operations in mainland China, fashion design, operational skills for quick turn-around and efficient port handling in Hong Kong, and Chinese market makers in Europe and the US have allowed the Chinese textile industry to make significant strides.

V
Capability Based Competitiveness

The challenges for the Indian textile industry range from defending domestic market shares, starting about two years from now, to entering new markets with existing products to entering domestic and new markets with new products. These require very different types of responses from firms as compared to their current approaches that have been highlighted earlier. A majority of Indian textile products are in the low cost, low value added segment which will never generate enough economic surplus for continuous investment in technology, practices and research. In addition, this segment is most susceptible to competition from other low cost countries, like Bangladesh, Morocco, Honduras, Vietnam, etc, who are slowly climbing up the technology ladder. Firms whose source of low cost is any of the following are going to be most vulnerable to competition:

- protection in various forms,
- low wage workers especially with no or little training,
- old machines which require heavy breakdown maintenance,
- externalising of environmental costs to society,
- clever accounting practices, and
- product mix that has not changed in a decade.

New markets and applications that can generate higher profit margins will require very different strategic responses from firms. Similarly, new strategies will be required to meet the competition from firms around the world in a post-MFA era. What is needed is to change focus from 'cost based competition' to 'capability based competition'. It must be noted that capability based competition does not preclude low cost, high quality, low delivery time and high value added operations.

A firm's ability to engage in 'capability based competition' depends on three key strategies: commitment, co-ordination and co-operation. Commitment is a decision to be in the business in the 'long run'. Co-ordination is the willingness to see industry as a single 'supply chain'. And, Co-operation is learning to jointly develop 'operational and technological' capabilities. By focusing on these three key strategies, firms can build distinctive capabilities that will allow them to create a niche for their products. There are several issues worth mentioning here – how does a firm develop such a focus or what is the role of the industry at large or the government policies in developing such a focus? Or what is preventing firms from developing such capabilities? While these issues need to be dealt with comprehensively, we will illustrate how a firm or the industry or the government policies can improve the levels of commitment, co-ordination and co-operation. It must be noted that such initiatives must be able to overcome some of the current weaknesses and should be able to draw from successful models around the world.

Tables 3(a), (b) and (c) give illustrations of the nature of key initiatives that form the portfolio of successful strategies with respect to developing commitment, co-ordination and co-operation, respectively. *Commitment* can be developed by investing in long-term resources like education of the workforce whether in-company or in-institution. Both, government and industry have to invest in this resource. The government can develop a scheme whereby a fraction of a firm's tax can be put in an escrow fund which can be withdrawn exactly in amounts spent on worker training. It is not only important for the firm but also for the state to ensure that the industry has well educated workers. Even when workers are empowered, they need to have abilities to make productivity improvements and hence the need for extensive training. Similarly, any investment in improving the quality of life of the workers and their families, outside the realm of salary or bonuses, will provide a long-term benefit to growth of the firm in terms of good personnel practices, worker motivation and productivity improvement. Levine (1995) has reported numerous examples where practices like pay for knowledge, employee ownership, sharing of gains, employment security with reciprocal contracts by both workers and management have lead to considerable increases in productivity and profitability of firms. Investment in technology has to be strategic in nature – the timing, nature and extent of investment should provide strategic advantage to a firm at least for a period of two-three years in the future. This issue is closely related to choice of product markets to compete in – product mix should be based on 'market pull' rather than 'technology push'.

Most firms focus on optimising individual elements that comprise a supply chain (ie, raw material suppliers, intermediate goods suppliers, end-product producer, distributors and/or retailers) which leads to lack of synchronisation. This results in either high inventories in the chain or long delays. Lack of information on production plans, inventory levels, market offtake, etc, and variability due to uncertainty in availability of resources, breakdowns, defects, expediting exacerbate this problem. *Co-ordination* strategy seeks to bring information at the place of usage and attempts to reduce variability which helps in synchronising different levels of decisions across the chain. At the firm level, shop floor improvement programmes, evaluation of the value of co-ordination, and implementation of pull production systems like JIT help in improving coordination. Industry associations can play a crucial role by co-ordinating demands and flows across the ginners, spinners, weavers etc. Internet can be used successfully to create such a database that can be updated continuously. Similarly, an Advanced Technology Centre needs to be set up which holds regular displays of the state-of-the-art textile technology from world over, co-ordinates the flows of technology to industry and networks with machinery producers and research centres to provide solutions to various technical problems. To facilitate the co-ordination process, it then becomes necessary to develop an independent certification agency which can rate the production units and the quality of products coming out of the plants. This is essential given the failure of capital markets to reveal to investors the true (and not the perceived) performance of textile firms. This could help firms to raise funds for long-term investments in technology, etc. It could form a basis for identifying partners in developing networks. For example, spinning units could enter into long-term relationship with certain good (ie, certified) ginneries; in turn, progressive ginneries would improve their processes in order to get certified which may bring premium to their products. Similarly, government policies can assist this strategy by ensuring that the idea of global supply chains become viable in each segment. This would not only ensure that firms improve their processes but will also ensure that good quality raw materials are available in the right markets at the right time. To remove inter-sectoral policy distortions, the government will have to re-organise the textile ministry to include all elements of the textile supply chain. This may be an effective way of not only co-ordinating policies but also in identifying weaknesses across the entire supply chain. (Or else, how will we ever stop receiving complaint of the kind recently made by knitting weavers in far east about the inferior quality yarn of 30s and 40s counts that came from India. The yarn producers blamed the cotton farmers for providing poor quality and contaminated cotton Shankar-6, H-4 and LRA varieties of cotton while the cotton farmers blamed the Gujarat government for providing tainted seeds of S-6, S-8 and S-10 varieties [Business Standard 1997].)

Another strategy which will help firms to develop distinctive competencies is that of *co-operation*. Whether it is a firm in the Prato region or Benetton in Italy or textile PSUs in China, they have one thing in common – ability to co-operate on technology development and operational effectiveness. Firms in other industrial sectors, for example, most Japanese automotive companies, Sematech for semiconductor R and D in the US or the Airbus consortium of EU, etc, have successfully practised advanced versions of co-operation to mutual advantage of participating firms. Maruti Udyog is one such successful example in our country. Co-operation can take a variety of forms – firms can form strategic alliances for technology development or for pre-competitive R and D or for common infrastructure development. For example, it would be wise for most spinning or weaving units to come together and help ginners improve their technologies and practices as they affect the quality of downstream operations. Similarly, large industrial houses could participate in joint research to develop new varieties of synthetic material with properties of cotton or for developing coloured cotton. When it would come to commercialisation, these same firms could compete with different end-products or using different processes.

Strategic partnerships can also exist at another level in the form of a 'Central-Satellite Firms (or CSF) Network'. Such a network would naturally have a large firm at the centre to which a variety of small firms (representing different elements of the chain) are linked. Such a network will have powerlooms, spinners, ginners, finishers, textile machinery

producers, transporters, etc. linked together to deliver products to customers. Of course, such alliances are based on unique capabilities that each firm will bring to the CSF network. It allows for firms to develop specific capabilities (by devoting resources to focused activities), reduces uncertainties in operations and provides flexibility to the network. It is clear that, very soon, competition would not be between firms but between network of firms. And those networks that are able to innovate quickly and more frequently in order to provide better quality and variety at low cost are the ones that will increase their market share. For example, this will enable a large mill to accept both large and small volume orders and deliver it using different entities in its own network. This would also leave large firms to play the role of a 'master innovator' on a continuous basis. Firms that are willing to accept shared vulnerability and vision of growth as a reality will gain considerably. Moreover, such a concept is based on recognition of the fact that innovation takes place through 'technology chains'. For example, to create a new type of a weave or to weave an existing cloth using a new process, the weaving firm will have to depend on the innovative ability of the textile machinery manufacturer who in turn may depend on the machine tool producers or an electronics control company to deliver such an effective machinery. One thing is clear from the experience in other sectors, the government cannot develop and must not control such a network. It can only provide partnership programmes for R and D (including declaring it as an infrastructure activity) or provide patenting support or help in the development of competition policy, etc. in order to encourage firms to come together. Individual firms along with the textile industry associations will have to assiduously develop such a system. This would require that various industry associations representing different entities in the textile supply chain (including the textile machinery manufacturers) will have formed an alliance based on *shared vulnerability and vision*. Then only will the industry be able to shift competition from between firms to between networks which is a hallmark of capability based competition. One would be failing in duty if we do not recognise that the list of top 10 corporate houses in India, in terms of R and D investment as per cent of sales, includes a textile machinery manufacturer, ie, Lakshmi Machine Works (the only one from the textile, clothing and related sector in this list) at sixth position for the year 1995-96

VI
Conclusions

It is apparent, from the benchmark studies, that Indian textile industry has 'islands of excellence' but the capability and performance of the average firm is not very high when compared to those in several other countries. The technology stock and work practices in our textile industry are outdated. There are distinct weaknesses in the structure of the industry, in processes like ginning and dyeing (and to some extent, in weaving because of its inability to weave high value fabric), lack of product or process innovation, poor shop floor practices, poor use of modern management practices, inadequate plant and equipment maintenance, etc. Given that the trading regime is going to change drastically in the next few years, the Indian textile industry as well as the textile policy will have to be re-organised and reworked. What complicates this effort further is that many countries are either ahead of us in this respect or have forged alliances with several trade blocs which follow a variety of restrictive practices. While this paper does not propose either of the two countries that we have studied, ie, Canada and China, as models for Indian firms in totality, there are several lessons that we can learn from them to design strategic responses that will provide comparative advantage to our primary textile sector. This, obviously, must include leveraging on our inherent strengths and changing the old mindset on competition.

Re-organisation of the textile sector has to be done at two levels – the firm level and at the industry level. This re-organisation as well as technology upgradation will require highly skilled workforce which the industry, currently, does not have as a whole. Strategic thinking to improve the competitiveness of the sector will require new industry policies, more investment in workforce education and technology on a continuous basis, improvement of manufacturing practices in plants, better linkages between various entities that form the textile supply chain and continuous investment in process and product R and D. This will help firms to develop capabilities and processes that would be difficult to imitate by a competitor.

The domestic textile sector has been quite competitive and has witnessed many upheavals. It has certain inherent strengths which have to be built upon and new contemporary strengths need to be added. This will make the industry more vibrant and competition more dynamic. With the removal of policy distortions and firm level non-competitive practices, the industry will be on its way to become one of the most modern in the world.

A Regulatory Body for the Liberalised Coal Sector

Suchitra Sengupta

Deregulation of the coal sector, by itself, may not lead to accelerated investment, expansion in production and competitive market conditions resulting in cost and price efficiency. Certain rigidities within the coal sector as also in the macro-economic environment imply that the gains of economic liberalisation can only be consolidated through the creation of a regulatory agency. This experience is not unique to India. Even mature market-oriented economies have come to accept the utility of regulatory agencies in simulating competitive conditions under less than perfect free market conditions.

This paper seeks to sketch the outlines of an ideal regulatory mechanism based on the experiences of other economies which have gone through the process of liberalisation/privatisation in the recent past and, against that background, to set out a proposal for a regulatory body for the Indian coal sector, keeping the specific conditions and requirements of producers and consumers in view.

THE Indian coal sector has recently been deregulated. The present paper attempts an analysis of the post-liberalisation scenario in the coal sector and proposes the setting up of a regulatory body in view of the anticipated market developments. The paper consists of the following sections:

(i) a review of the current reserve position of the nationalised coal companies (NCCs) and the projected supply and demand gaps during the Ninth Plan;

(ii) salient features of the recent policy declarations aimed at attracting investments to produce additional coal for meeting burgeoning demand from the user industries;

(iii) possible limits to liberalisation imposed by infrastructural inadequacies and institutional rigidities, and hence examination of the need for a regulatory body;

(iv) outline of an ideal regulatory mechanism based upon the experiences of other economies which have gone through the process of liberalisation/privatisation in the recent past; and

(v) proposal for a regulatory body for the coal sector, keeping the specific conditions and requirements of producers and consumers in view.

I
Indian Coal Sector: A Review

Prior to 1973, the Indian coal industry was privately owned and operated. The rising coal demand from the iron and steel sector and the consequent need for large scale investments prompted the government to nationalise the coking coal mines under private ownership by the Collieries Act of 1973. Subsequently, the non-coking coal mines were also nationalised in 1974. State-ownership of the coalfields was further justified on the grounds of conserving an exhaustible natural resource and of halting widespread environmental degradation perpretrated by the private mine-owners.

Accordingly, Coal India (CIL) was formed in 1973 to serve as the public sectorholding company for the nationalised coal companies. Since then, more than Rs 11,000 crore have been invested in this sector. Estimated capital stock at 1989-90 prices stands at Rs 16,521 crore. Production in the post-nationalisation years grew at the CAGR of 6.1 per cent per annum, raising the output of total coal from 78 million tonnes in 1974-75 to 270.13 million tonnes in 1995-96. Government budgetary support to the public sector coal companies was 95 per cent till 1990. However, with the introduction of the new economic policy and the associated structural adjustment programmes, the share has come down dramatically to 10 per cent of the plan outlay in this sector.

Despite a quantum jump in output, the nationalised coal sector's performance in terms of a number of critical indicators of efficiency (i e, movements in productivity, capital output ratio, mining techniques, quality variations in mined coal, etc) fell far short of international standards. This experiment with state-ownership has, however, created a huge monolithic parastatal commanding a lion's share of the mineable coal reserves of the country.

The present assessment of coal reserves in India is about 200 billion tonnes. Out of this 69 million tonnes are proven resources (Table 1). The proven coal reserves under the ownership of the CIL is about 53.76 billion tonnes (Table 2) which forms about 77 per cent of the proven reserves of coal available nationally. Nearly 50 per cent of their proven reserves (i e, 26.24 billion tonnes) are assessed to be recoverable. Out of the total recoverable reserves of 26.24 billion tonnes, projectised reserves are 8.24 billion tonnes, while 18 billion tonnes are yet to be projectised. In the case of coking coal, concentration of ownership of the resources (i e, reserves and washing facilities) in the CIL is even higher.

The end-user wise consumption of coal has undergone a significant change over the last two decades. In 1970-71, the 'power' and 'iron and steel' industries had equal shares of about 18 per cent, in the total consumption of coal. In 1994-95, the situation has altered radically with the power sector accounting for nearly 70 per cent of the total consumption while the share of the iron and steel industry declined to around 13 per cent. Over the time-period, consumption of coal in the power sector grew at the rate of 20 per cent per annum (CAGR) as opposed to 6.7 per cent in the iron and steel industry. Decadal changes in the pattern of coal consumption by various user sectors are shown in Table 3.

The projections of sectoral demand for coal, estimated in the report of the Committee on Integrated Coal Policy have been shown in Table 4 . Demand for coal emanating from the power sector has been estimated to more than double from 215 million tonnes in 1996-97 to 500 million tonnes in 2001-02. Demand for coking coal from the steel sector is, likewise, projected to go up from 40 million tonnes to 80 million tonnes over the same time-period. Assessed availability from the existing mines of the NCCs and the private mines will leave gaps of 128 and 122 million tonnes, respectively, by 2001-02 and 2006-07. The gaps, in fact, may even be larger if the capacities with the private sector do not become operational by 2006-07.

Given the current and anticipted levels of foreign exchange reserves and the infrastructural facilities at the ports as well as inland, it would appear that only a

fraction of the total gap can be met through imports. The only viable alternative for bridging the gap is to add to the capacities in the domestic coal industry. The currently asessed demand and supply gaps indicate that the existing supply base needs to be augmented by about 20-25 million tonnes annually over the coming decade.

Investments for expanding coal production becomes critically important at this juncture as it is linked with targeted power generation during the next two plan periods. Required power generation during the terminal years of the Ninth and the Tenth plans has been projected as 1,44,168 MW and 2,07,842 MW, respectively. Out of the total planned power generation, more than 50 per cent is assumed to be coal-based (i e, 57 per cent in 2001-02 and 54 per cent in 2006-07). Apart from the shorter lead time (gestation lag) for thermal power plants as compared to hydel power plants, generation based on domestic coal is preferred as the cost of generation is the lowest among other alternative fuel sources. According to expert estimates (Coal Report of the BICP, 1994), an investment of about Rs 40,000 crore at current prices will be required in this sector over the next 15 years.

After two decades of state control, the coal policy of the government has come a full circle by conceding entry, once again, to private capital. The paradigm shift in the development strategy of the government, the stringent fiscal conditions imposed by the SAP, lack of investible surpluses within the state sector and the opportune integration with the fund-rich global capital market – all led the state to liberalise its coal policy. Ironically, the justifications offered, i e, mobilisation of investible resources for expansion of capacity are the same for nationalisation and the subsequent liberalisation.

II
Reforms in Coal Sector, 1992-96

Phased liberalisation of the coal sector began with the launch of the programme of general economic reforms in 1992. The initial package of reforms permitted private sector investments only in captive coal mines of selected end-using industries, e g, steel, power and cement.

With this partial dereservation of capacity, coal mining blocks with 150 million tonnes of assessed capacity were allotted to 17 power and steel projects. Production from these projects, however, are yet to materialise. Moreover, growth in the production of domestic coal decelerated during the post-reform years. Total domestic coal production increased from 238.26 million tonnes in 1992-93 to 270.13 million tonnes in 1995-96, registering a growth rate of a little over 4 per cent per annum. This is lower than the annual compound growth rate of 6 per cent achieved during the regime of nationalised coal industry (i e, 1975-76 to 1991-92). The slowing down in the growth rate was caused by an absolute decline in the output of coking coal from 45.36 million tonnes in 1992-93 to 40.10 million tonnes in 1995-96. A positive growth rate of 4.32 per cent during these four post-reform years could be maintained as the decline was neutralised by a 6 per cent annual growth rate achieved by non-coking coal output (Table 5). Obviously, the partial deregulation measures did not result in the expected incremental supply from the private sector. Import of coal, especially, coking coal has increased manifold in the post-liberalisation years.

Source: Report of the Committee on Integrated Coal Policy, Planning Commission, 1996.

As partial deregulation did not lead to the expected expansion in capacity or production, the government of India constituted a Committe on Integrated Coal Policy under the aegis of the Planning Commission in 1995. The report of the committee was placed before the parliament after its submission in May 1996.

The committee framed its recommendations on the central premise that a conducive policy environment has to be created for attracting private investments to supplement investments in the state sector. The recommendations, therefore, seek to promote generation of internal resources by the existing producers and also to remove the deterrents to the entry of private capital into this sector. Apart from deregulation of the distribution and prices, the proposals relate to liberalisation of provisions guiding acquisition, exploration and operation of mines, participation of overseas capital and technological upgradation. The major recommendations of the committee are broadly discussed in the following paragraphs:

(a) Coal mining has to be , once again, opened to private investors in a total reversal of the policy stance adopted while nationalising the coal sector during 1972 and 1973. Necessary amendments will be made in the Coal Mines (Nationalisation) Act of 1973 to allow any Indian company to mine coal and lignite not only for captive consumption but also for sale.

(b) Approval of foreign equity participation up to 50 per cent should be automatic. Projects with higher foreign equity will be subject to clearance by the Foreign Investment Promotion Board and will be registered with the Registrar of Companies.

(c) Foreign investors shall be permitted to set up 100 per cent subsidiaries for mining and exploration ventures.

(d) The new policy shall do away with the concept of linkages for coal supplies.

(e) Competitive bidding for the identified blocks of coal and lignite, based on the criteria of minimum recoverable percentages and minimum transfer price, will have to be allowed. The NCCs will also have to undergo the same procedure, should they want to procure new mining blocks.

(f) Furthermore, the bidder should start production within a given time-frame, failing which suitable penalties shall be imposed.

Close on the heels of the preliminary round of reforms, the coal sector was further liberalised in two successive stages in keeping with the recommendations of the Expert Committee (1996). The second

round of deregulation came in 1996 when controls on the distribution and prices of coking coal and A, B and C grades of non-coking coal were withdrawn (vide a Gazette Notificaton dated March 22,1996). A year later, on February 11, 1997, the government of India announced further changes in its coal policy which, perhaps, represent the penultimate step towards total deregulation of this sector. The salient features of the latest round of deregulation are as follows:

(i) The prices and distribution of D grade of non-coking coal, hard coke and soft cokes were deregulated with immediate effect while provisions were announced for deregulation of the other grades of coking coal (i e, E, F and G) from January 1, 2000.

(ii) The intention was expressed to suitably amended the Coal Mines (Nationalisation) Act of 1973 to allow private investors to engage in mining activities not only for captive use but also for sale.

(iii) Along with the above pronouncements it was also intended to amend the Mines and Minerals (Regulation and Development) Act of 1957 to set up an independent body to allocate blocks on the basis of competitive bidding.

III
Need for a Central Regulatory Authority

It is clear from the above discussions that mobilisation of investible resources for enhancing future output has been the *raison d'etre* for deregulating the Indian coal industry. However, as in all reform programmes, it is also expected that decontrolled prices and removal of barriers to entry will lead to greater cost, price and allocative efficiency by creating competitive market conditions. These concomitant policy objectives seeking to reap the benefits of free play of market forces become especially relevant in the context of low capital and labour productivity of the Indian coal industry. More importantly, inefficient pricing in the coal sector has the potential to quickly push costs in every sector of the economy via its extensive linkges through the 'power' and the 'iron and steel' sectors. Maintaining price-efficiency of this important primary resource becomes the overriding objective for ensuring international competitiveness of the downstream manufacturing industries. A purely competitive market will lead to the maximisation of consumers' surplus as prices are set near the long run marginal cost of production. Efficiency in resource use is also guaranteed because the producers as price-takers can maximise profits only by minimising costs.

Conditions of pure competition may not exist in reality, but similar gains and improvements in efficiency can be extracted from creating a market with multiple producers, each with limited power to influence prices. Costs and prices can be kept under pressure provided there exists some degree of competition among the producers. In a globalised economy, competitive pressures can also be exerted through free-flow of imports with minimal tariff.

Free market conditions may not, however, lead to competition and consequently to maximum/greatest social benefit in the following cases:

(i) in the presence of falling marginal costs over a large range of output, i e, production conditions giving rise to natural monopolies; and

(ii) in the presence of external costs and benefits associated with the production or consumption of the output;

Additionally, implementation of the programmes of privatisation/liberalisation in erstwhile command economies may also hinder the growth of a competitive market in the presence of large state monopolies with a large resource base. In such economies, the existing legal systems, especially the laws governing ownership of means of production, need to be re-oriented for accommodating the principles of equal opportunity to all the prospective economic agents, in both the private and the state sectors. Liberalisation under conditions of insufficient infrastructural facilities (ie, transportation network, handling and storing facilities, etc) may also lead to the growth of local monopolies, especially in the case of bulk commodities such as coal.

We now examine whether the prevailing conditions in the Indian coal industry guarantee a fairly competitive market after deregulation, i e, absence of a very large producer with enough market powers to influence prices, uniform minimum achievable cost of production for every producer for similar end-products, effective elimination of all covert and overt barriers to entry. The observed conditions which may detract from the ideal competitive market conditions are listed below:

(i) Firstly, even though studies by the BICP have found evidence of some amount of scale economies, the extent of decreasing costs does not establish the conditions of a natural monopoly. However, for historical reasons, we do possess state monopolies in this sector commanding over 70 per cent of the proven resource base.

(ii) Secondly, the deliverd cost of coal with the same quality parameters (including both the costs of mining and washing) varies widely from one mining block to another, depending on their geophysical conditions and availability of infrastructure. Therefore, minimum cost for the same end-product will differ from one producer to another – thereby conferring some degree of monopoly power to the producer most favourably placed in terms of quality of owned coal reserves and access to essential infrastructures. To obviate the effects of such extraneous constraints on the final cost of production, utmost care has to be taken in assessing the value of the blocks put up for competitive bidding. The computed values

Source: Report of the Committee on Integrated Coal Policy, Planning Commission, 1996.

should reflect the advantages/disadvantages of location and mining conditions.

(iii) Thirdly, coal is not a homogeneous commodity. The market for coal can be subdivided into non-competing segments, i e, the product of one category is not a perfect substitute for the other such as coking and non-coking coals, etc. Technological progress may increase substitutability in future. But, under the present conditions, post-deregulation ownership pattern may invest monopoly powers to a very small number of producers/suppliers for a particular product type. For example, BCCL, a subsidiary of the CIL, has in its possession more than half the country's total prime coking coal reserves.

In this connection, it is important to focus attention on some important elaborations (outlined in the Report of the Committee on Integrated Coal Policy) on the suggested policies related to pricing and competitive bidding of new blocks. A critical analysis of these aspects is warranted for a clearer understanding of the market situation that is likely to emerge after the implementation of the new coal policy.

(i) Firstly, it has been suggested that out of the identified coal blocks ready for production/exploration, the NCCs may be allowed to retain those required for meeting their commitments. The recommendation, however does not specify the criteria or the norms for such retention by the NCCs, i e, whether all non-projectised blocks are to be brought under competitive bids. Release of only the marginal and outlying blocks for competitive bidding may fail to attract private sector investments to the required extent.

(ii) While discussing the framing of bid-evaluation criteria, the report states, "Obviously, the attempt would have to be to give preference to parties which are already engaged in coal production in the country [i e, the NCCs] or parties who will be using bulk of the coal for their captive use." Once again, introduction of such biases in the bid-evaluation criteria would defeat the very purpose of attracting private capital and thereby injecting elements of competitiveness in a sector dominated by state monopolies.

The lack of logistical/infrastructural support may also prove to be inimical to competitive price-setting. The envisaged constraints in this area are discussed below:

(i) The scope for keeping domestic prices in check by aligning these to the border prices (i e, world) appears to be restricted by the inadequate port facilities. For example, demand for total coal from the steel sector (of which 75 per cent will be coking coal) is projected to go up from the present level of 40 million tonnes to 63 and 80 million tonnes, respectively for 2001-02 and 2006-07 (Table 4). Total coking coal consumption of this sector during 1996-97 was around 33 million tonnes out of which 10 million tonnes have been imported. Domestic availability of total steel grade coal has been around 26 million tonnes in 1996-97. If domestic production does not increase significantly, imports of the order of 40 to 50 million tonnes per year will have to be contracted over the next 10 years. Even the present import levels of 10.16 million tonnes of coking coal, has put the port and handling facilities under considerable stress (Table 6). The port traffic of non-POL bulk commodities, e g, foodgrains, coal, fertilisers and other such cargo which are not amenable to containerisation is at present 78.58 million tonnes (Table 7) against a total capacity of 72.95 million tonnes. The already overutilised capacities as well as the port handling and storing facilities will have to expanded sufficiently to accommodate such large increases in import requirements. It should be noted that the port facilities are required for coastal transportation of domestic materials as well as imports. Therefore, bottlenecks at the ports will impose an effective ceiling on the actual volume of imports. The Expert Group on infrastructure has projected that total traffic at the ports will grow from 240.19 million tonnes in 1996-97 to 435.01 million tonnes by 2001-02. Out of this incremental requirement of 215.02 million tonnes of port capacity, the non-POL bulk items will account for 75.81 million tonnes. Total investments required to achieve this capacity will be in the region of Rs 1,00,729 million by 2001-02, of which about 68 per cent will be furnished from internal accruals while Rs 32,562 million will have to be mobilised additionally. The magnitude of funds requirement indicates the enormity of the problem.

(ii) Problems of inland transportation may prove to be a major bottleneck in transporting coal from the pitheads to the

consuming centres. This may prove detrimental in several respects – firstly, absence of extensive transportation linkages may discourage private investments, or it may involve drastic change in the policies for location of coal-intensive power plants at the pitheads; secondly, region-specific demand and supply mismatch may lead to appropriation of 'rent' by traders and other intermediaries. Although, efforts are being made in both directions, but the gap between required and existing transportation facilities remain high (Table 8).

Attracting private capital in this core sector also requires extensive changes in the legal framework. The laws that govern acquisition and exploitation of natural resources are numerous, complicated and involve many agencies. The resulting extension in the time-cycle between conception of a project and its commercialisation increases the cost of capital consuderably. Therefore, simplification of the legal framework and elimination of the many layers of approval at the state and national levels are the two most essential prerequisites for minimising the lead-time and thereby the perceived risks of investment undertaken by the private entrepreneurs. To ensure adequate inflow of private capital, modifications are urgently needed in the following Acts:

(i) Forest Conservation Act, 1980,

(ii) Coal Bearing Areas (Acquisition and Development) Act, 1957,

(iii) Contract Labour (Regulation and Abolition) Act, 1970, and

(iv) Mines and Minerals Regulation and Development Act.

It is therefore clear that the Indian coal sector may not operate under conditions of competitive price setting over the medium-term. The pre-liberalisation structure of the industry with a high degree of concentration of the reserves and assets in the nationalised producers, the infrastructural bottlenecks and the stautory and legal obfuscations are the principal factors which might retard competition in this sector over the short and the medium run. Under the existing constraints, even the bilateral price fixation suggested by the report of the Committee on Integrated Steel Policy may be biased in favour of the established domestic suppliers. The coking coal market has the essential characteristics of a bilateral monopoly – a single big buyer, i e, the integrated steel producers using the BF-BOF route and the single seller, i e, the CIL. But even in this subsector of the total coal market, the balance of price-setting bargaining power will tilt towards the seller as long as competition remains limited by the lack of supplies from imports. Moreover, coal-mining will always give rise to deleterious environmental effects giving rise to subsatntial externalities. Lastly, in a liberalised coal market dominated by a very large state sector, private investments will take place only on the assurance of fair play in terms of the legality of acquisition of mining rights, access to physical and financial and other support facilities at par with other participants.

It is clear that transition from a monopoly situation to a more competitive system requires balancing of the interests of the various participants in the market. After deregulation of a sector, it is possible to have situations marked by the coexistence of public-ownership and public-operation, public-ownership and private-operation and private-ownership and private-operation. Such diverse market relations will have to be supported by an overall regulatory mechanism. The need therefore arises of a regulatory body with the following broad responsibilities:

(i) to create conditions conducive to competitive as opposed to monopolistic/oligopolistic price-setting so that the consumers' interests are protected;

(ii) to ensure standards of performance (in terms of quality of output, best operating practices, etc) of both the producer and consumer of coal such that inefficiency of one party is not subsidised extensively by the other (i e, inefficiency of the producer should not impinge on the surplus of the end-user through higher input costs. Similarly, inefficiencies of the end-user should not be made good by subsidising inputs at the cost of the supplier's earnings);

(iii) to ensure that the external costs of coal mining are internalised adequately in the cost and price structures;

(iv) to create a level playing field for the state sector producers and the private investors which is an essential prerequisite for attracting private capital on a sustained basis, i e, provide for a process of competitive bidding and economic parameters for bidding so that parity is maintained in the treatment meted out to different classes of investors.

(v) To arbitrate and adjudicate in case of disputes between the different players in the market.

IV
Defining a Workable Regulatory Authority

Under the emerging market conditions in the coal sector, it is necessary that the regulatory framework be well-defined in terms of transparency, clarity of obligations and duties and responsibilities for all the agencies involved in the process. The regulatory body must be autonomous, empowered, transparent and accountable.

There must also be a guarantee that the rules, policies and procedures are stable so that the producers are afforded a sufficient planning horizon.

The regulatory agencies should operate at arm's length from the governmental set-up. The distancing of the regulatory body from the direct ambit of the governmental machinery becomes more important in a market situation dominated by a large-sized producer or consumer in the state sector. In such cases, attaching the agency to the governmental ministries/departments will hamper its price-regulatory functions which involve reconciling the often conflicting objectives of providing the output to the final consumer at a fair price, on the one hand and setting prices with a rate of return which will attract new entry.

To maintain operational autonomy, these specialised agencies must be manned by professionals in the field with a professional board representative of all interests and services of the particular sector and professionals in the financial field.

The body should be set up by an appropriate statute. Without statutory powers, the effectiveness of the regulatory agency will be lost. The regulatory authority in each sector must be vested with punitive powers to be effective. In other words, the body should be able to enforce its decisions and hence should have sufficient executive powers. This marks an important departure from the recommendation of the report of the Committee on Integrated Coal Policy, where it is proposed that the regulating authority can arbitrate only on reference and compliance with its decision would be entirely voluntary

As a corollary to its empowerment, the regulator should also be privy to such information as are needed to regulate and monitor the various market players in an unbiased fashion. The regulatory functions would include identification of problems, fact-finding, dissemination of information, formulation of rules, setting of norms and standards and enforcement of the rules within the existing parameters of the legal system. Therefore, efficient conduct of the regulatory activities would need an enormous information base. In other words, the regulator should have an intimate knowledge of all the facets of the activity in question. This once again underscores the need for professional expertise.

As dispute resolution through arbitration is an important function of the regulatory body, it needs to be invested with some judicial powers. The regulatory agency may have a quasi-judicial character. Accordingly, effective mechanisms to settle disputes quickly are to be set up. If the regulatory mechanism does not have judicial powers, then arrangements should be made to set up such mechanisms within the existing legal framework, e g, appellate tribunals for the coal sector.

Ideally, for one economic sector a single regulatory body should be formed which shall subsume the different regulatory and facilitating functions within itself. Stress should be laid on the creation of a multi-functional single entity rather than a number of regulatory bodies each looking after different aspects. The objectives of a regulatory body outlined above are all inter-related and should be dealt with by a single agency. For example, competitive pricing will depend crucially on the even distribution of the means of production which again will depend upon fair bidding of the mining blocks. A multiplicity of regulatory bodies will once again lead to conflicting decisions causing delays and dilations in the investment process, which will defeat the very purpose of liberalisation.

In view of such overlapping jurisdiction of the state and the centre, the regulatory agency for coal should operate at two levels, the central/nodal agency and the state level agencies. This is essential in view of the fact that many of the laws and regulations governing ownership rights of natural resources as also financial impositions (i e, royalty and cess) fall within the ambit of state administration. Ideally, overlap in the jurisprudence of the state and the centre should be reduced to a minimum, but such processes in a pluralistic, federal polity as India, will take time. In the meanwhile, the central or the apex regulatory agency may serve as a co-ordinator/arbitrator to minimise the areas of friction.

Some experts feel that government funding of the regulatory bodies should be avoided to the extent possible. The agency may be funded by annual fees, licence fees, recurring charges or royalty payable by the producers and consumers of coal as a percentage of annual turnover. Care must be taken to specify that the levies are not in the nature of taxes. Moreover, if possible, the charges should be levied as a percentage of services provided. However, some amount of confidence-building on the part of the regulator may be needed before the cess/levy can be instituted. Therefore, to initialise such efforts, funds may be transferred from the government to build a corpus for operating the body.

The regulator operating at arm's length from the ministries/ departments should, however, be accountable to parliament. At the same time, the fact that the regulators will have representatives of the producers and the consumers will perforce make them accountable to the economic agents who are supposed to benefit from their activities.

V
Experience of other Countries: Does a Standard Model Exist?

Over the last two decades, widespread liberalisation of the infrastructure and other core/strategic sectors has taken place across different economies of the world. The compulsions to privatise and liberalise have been diverse. The recurrent reasons, however, have been the following:

(a) mobilisation of private capital for financing massive investment requirements in these sectors under conditions of fiscal stringency;

(b) improving the efficiency levels of these strategic sectors with strong linkages with the rest of the economy and thereby improving the international competitiveness of firms;

(c) unbundling of infrastructural services made possible by technological changes which puts at rest the fear of a privately owned natural monopoly; and

(d) vastly increased possibility of a private firm raising the huge investments typically needed in such sectors as the capital markets get globally integrated.

Irrespective of the circumstances which led to liberalisation/privatisation, every transition from monopoly to competitive markets necessitated some variant of a regulatory institution. The basic objectives of such institutions are to balance the interests of all the economic agents operating in that sector and to create conditions for sustained investment. A regulator's function is to reconcile the interests of the consumer who will benefit by competitive prices with those of the producer who would invest only on the expectation of a high enough return. The exact nature of institutional arrangements will depend upon the political and administrative systems of the concerned economy But whatever the form, the rules of regulation have to be comprehensive, transparent and as non-discriminatory as is possible.

In countries such as the UK and Australia, the regulatory agencies work in close collaboration with the executive. The regulators in the UK are autonomous non-departmental bodies known as the 'Next-step Institutions' which are accountable to

parliament. The US and New Zealand, on the other hand, rely more on transparent legal procedures which are subject to judicial process. According to the Expert Group on Commercialisation of Infrastructure Projects (Rakesh Mohan Committee), ".... the emerging scenario in India suggests that it would now be better to opt for statutory regulatory agencies which operate on transparent legal basis and whose decisions are subject to judicial process".

The following sections contain a brief outline of some of the regulatory mechanisms in operation in different countries of the world.

National Energy Board (NEB), Canada: Established as a statutory, quasi-judicial body under the National Energy Board Act (1959), the NEB regulates the energy sector. The board has the power to issue and review permits, licences and certificates to operate, inquire into accidents resulting from pipelines or an international power line, cancel licences, hear and pass judgments on complaints and reports, initiate inquiries and hold public hearings, etc. The board is duly authorised to resolve inter-party conflicts and make decisions based on records. While setting tariffs, the board ensures that they are just and reasonable and there is no "unjust discrimination". Pricing is usually based on the "cost of service" methodology, taking into account operation and maintenance expenses, return on equity, debt service, income tax and other taxes.

Office of Gas Supply (OFGAS), United Kingdom: The Office of Gas Supply was established under the authority of the Gas Act, 1986. It is responsible for monitoring British Gas PLC's activities as a public gas supplier, including enforcement of a price formula which governs the maximum average price that British Gas is allowed to charge tariff customers. It is also promoting competition in the gas industry because giving customers a choice delivers better value for money than regulation. As competition develops, the role of OFGAS will broaden from regulating British Gas to ensuring that a fully competitive gas market develops in an orderly way. The structure of the organisation is: (1) Director General of Gas Supply, (2) Legal Adviser, (3) Director, Regulation and Business Affairs, (4) Director, Tariffs, (5) Director, Consumer Affairs, (6) Director, Public Affairs, (7) Director, Administration.

Office of Electricity Regulation (OFFER), United Kingdom: The OFFER is a non-ministerial government department established under the Electricity Act 1989. It is responsible for monitoring the activities of all licensed generators, transmitters and suppliers of electricity. The Director General heading offer has to exercise his regulatory powers so as to promote competition in the generation and supply of power; ensure that all reasonable demands for electricity are satisfied; protect consumers' interests on prices, security of supply and quality of services; promote the efficient use of electricity. The OFFER has 12 regional offices to monitor the regulated activities and to deal with consumer enquiries and complaints. The structure of the company is as follows: (1) Director General of Electric Supply, (2) Deputy Director General, (3) Director, Regulation and Business Affairs (licensing, use of system by National Grid and Regional Corporations, generations including renewables, competition in generation, pooling and settlement, collection and calculation of the Fossil Fuel Levy), (4) Director, Regulation and Business Affairs (monitoring and reviewing price controls, ensuring compliance with licence conditions on cross-subsidisation, economic purchasing issues, providing accounting and economic analysis), (5) Director, Supply Competition (competition in supply with deregulation in 1988), (6) Legal Adviser (legal advice on director general's activities, monitoring and enforcing compliance to licences and statutory regulations), (7) Technical Director (monitoring and compliance with technical standards, grid code, distribution code, metering), (8) Chief Examiner (meter examinations, pattern approval of electricity meters, certification of quality assurance system, authorisation of meter manufacturers and repairers according to regulatory rules, registration of meter operators), (9) Director of Consumer Affairs, (10) Director of Public Affairs and (11) Director of Administration.

Coal Authority, United Kingdom: The Coal Authority was established under the Coal Industry Act 1994 to manage certain functions previously undertaken by British Coal, including ownership of unworked coal. It is responsible for providing information on coal reserves and past and future coal mining. It settles subsidence claims not falling on coal mining operators. It is also responsible for the management and disposal of property, and for dealing with surface hazards such as abandoned coal mine shafts.

Federal Energy Regulatory Commission (FERC), US: The FERC of the US, created by a statute in 1977, is successor to the Federal Power Commission that was set up as early as 1920. The FERC is an independent regulatory commission that has clearly defined areas of jurisdiction in gas, oil, electricity and related environmental matters. In electricity, the commission's functions include the sale of wholesale electricity and inter-state transmission of electrical energy. Retail electric sales, i e, sales to end-users, are regulated by the state Public Utility Commissions. Transactions that do not involve end-users, such as utility-utility purchases and sales, or private power projects to utility transactions are wholesale and hence come under the jurisdiction of the FERC. In case of hydro-electric power generation, the commission has powers to licence projects, investigate dam safety and assess head-water benefits and environmental issues and promote inter-agency co-ordination.It also orders provision of extraordinary services when it is in public interest. It ensures wholesale ratos are reasonable and just, not unduly preferential and discriminatory. FERC has five members selected by the president for five-year staggered terms with the consent of the Senate. It meets twice a month to consider licence applications, rate filings and other matters submitted by regulated companies and sets industrywide rules. Commission meetings are open and televised.

Regulation of Energy Sector, New Zealand: The New Zealand government is committed to 'light-handed regulation' of the energy sector. It has included both the electric and gas industries in its programme of deregulation and privatisation. In 1987, the publicly-owned electricity industry was corporatised as Electricorp, and the functions of generation and marketing were separated. In 1992, with the enactment of the Energy Sector Reform Act, electricity generation was officially deregulated. Responsibility of the high voltage transmission was given to a corporation, i e, transpower. The area distribution authorities were corporatised at the same time. At the same time the local gas utilities were corporatised and required to maintain separate accounts for their transportation of gas by pipeline and their retail operations. The market for bulk gas supply was opened up to competition. In contrast to the UK, the New Zealand government did not consider it necessary to establish specific regulatory authorities. Instead it relied on the power of the Commerce Act to police anti-competitive behaviour and the abuse of monopoly power. Critics of this system hold that courts are only referral bodies and that the process may be protracted.

VI

Proposed Coal Regulatory Authority

In view of the recent deregulation of the coal sector it is proposed that a single autonomous and empowered regulatory authority be instituted in this sector on the basis of a suitable parliamentary decree The salient functions of the authority will be

(i) to promote competition i e to create a market with multiple producers each with very limited powers to influence price

(ii) to oversee prices and protect consumer's interest through regulating prices in areas where residual monopoly powers natural or historico specific will remain

(iii) to articulate and achieve non-market objectives i e environmental protection and conservation of natural resources and

(iv) to resolve inter party disputes

The proposed authority therefore is perceived to have three distinct types of functions

(i) regulatory functions

(ii) facilitating functions and

(iii) adjudicating functions

The regulatory body should be adequately empowered to carry out its functions effectively The required changes in the existing legal and executive structures may be suitably changed to accommodate such a body

Promotion of competition can be achieved by removing the obstacles/disincentives to the entry of private capital in the coal sector In the short and the medium run this would require fair distribution of the explored but unworked coalfields through competitive bids The requirement for an autonomous body to oversee the process of identification and fixing of economic parameters for allocation of coal blocks has been highlighted by the experience of the existing captive coal mines of the user industries In many of the cases the marginal mines with inferior geophysical characteristics leading to high mining costs/low returns have been alloted Moreover the size/capacity of the mining blocks were often not commensurate with the input requirement of the user throughout its economic life In the long-run fresh investments by new players can be sustained by stepping up exploration work on inferred coal reserves and by disseminating geological/technical information to the prospective explorers/miners (both for sale and captive use) It is therefore proposed that

(i) The agency should be invested with the right to allocate all existing unworked/non projectised proven reserves of coal mining blocks, irrespective of their current ownership, to eligible bidders For the efficient and unbiased allocation, it should have the right to frame appropriate bid-evaluation criteria and to determine the fair price of the block based on justifiable economic criteria i e, the minimum economic recovery percentage, minimum transfer price, etc

(ii) The agency should be endowed with the right to take appropriate steps to accelerate the pace of exploration of the inferred reserves Once again, allocation of exploration rights/licences should also rest with this authority The appropriate terms for conferring exploration rights to different kinds of investment proposals i e exploration only exploration-mining open market sales exploration-mining-captive consumption should also be decided by the authority

(iii) To promote competition the authority should disseminate information on geo mining conditions of different categories of mines as obtained from the geological survey of India and other independent explorers as and when available The fees charged for such information may then be suitably distributed among the different agencies involved in generating the information base

For protecting the consumer s interest, it will be necessary to ensure that the prices charged are fair and based on the most efficient production process It is proposed that

(i) The authority should have the powers to notify normative pithead prices for different grades of coal, especially where noticeable concentration of ownership of reserves exist The normative prices are to be fixed on the basis of achievable best practice norms of production and should also guarantee a reasonable return on capital At the same time care should be taken to see that the normative prices are comparable to the landed cost of corresponding grades of coal at the ports assuming that duty rates are brought down to comparable international levels Moreover as coal is an exhaustible non renewable natural resource the authority must impose discipline in coal use at the users end This calls for an element of discount or premium in the normative price for promoting user-efficiency of coal

(ii) It should however be noted that cross subsidisation between different grades of coal may have to be resorted to when welfare or strategic considerations outweigh the considerations of productive efficiency For example coal being a bulky

commodity, the delivered cost of coal may lie well above the normated pit-head cost, the difference being equal to the transportation cost. For low valued coal (soft-coking coal for domestic use, etc), where transportation cost may form the bulk of the delivered cost, some form of cross-subsidisation may be necessary. In such cases of aberration from normative pricing, the authority must clearly state the reason and the sources of cross-subsidies.

(iii) In a deregulated market for coal, it is expected that intermediaries will operate on the supply side. Thus, the final price paid by the consumers (other than those making direct bulk purchases) will depend upon trading margins. Therefore, the authority should also have control on the permissible trading margins. As it may not be practical to include all traders into such a scheme, it is proposed that large traders with turnover exceeding a stipulated amount, be brought under the jurisdiction of this scheme. Last but not least, the pricing formula must devise an effective method of recovering and distributing the costs of environmental degradation among the various beneficiaries of the mining operations.

(iv) The regulatory authority may also decide on the segregation of vertically integrated activities in the interest of promoting efficient resource use through competitive pressures, e g, segregating washing operations from mining.

(v) It must also possess punitive powers to bring erring parties to book through imposition of penalties, i e, cancellation of licences, etc.

The authority must also perform a number of facilitating functions to expedite the entry of private capital, both domestic and overseas, to the coal sector. All prospective investors in the coal sector will have to act within different sets of legal frameworks under different sets of administrative authorities (i e, local level, state level and central), often overlapping and acting at cross-purposes. The resulting conflicts and increased risks have proved detrimental to the inflow of investments. Therefore, it is suggested that:

(i) The authority, through its subsidiaries at regional levels, should serve as a single-window agency for obtaining clearances for the investment proposals at different levels of administration. To act effectively in this matter and to ensure speedy execution of projects, it should be granted powers to circumvent the existing procedures and interact directly with the different judicial/executive agencies involved.

(ii) In the process of doing so, the authority will have gained intimate knowledge of the various bottlenecks and anomalies in the system. Therefore, the regulatory body should be enbled to make suggestions to the relevant agencies for effective rectification of the shortcomings.

In a deregulated market, the authority is required to see that all contractual obligations between a seller and a producer are duly respected. This is more important in cases of residual monopoly power resting with the supplier. For example, non-conformity with stipulated quality (sub-standard products), interrupted or delayed despatches which cause financial damage to the user should be discouraged. The Function of resolution of inter-party disputes, gives rise to the following suggestions:

(i) The authority should be granted a quasi-judicial apellate status to resolve all such cases and impose suitable penalties on the offending parties.

(ii) More importantly, the authority should have access to all information from all the market players that it needs to discharge its duties as a price-setter and an arbitrator.

The regulatory authority must be truly autonomous, functioning out of the direct line of control of any specific ministry or department. Its members should be appointed by the president of India and accountable to parliament. The core functions of the authority should be discharged by professionals with demonstrated expertise in coal and its user industries. The proposed structure and division of the core functions are as given below:

(1) *A technical division* with the responsibility of fixing the technical norms for exploration, excavation, mining and beneficiation. This division should also have the power to ask for relevant information from the concerned parties and be responsible for analysing and disseminating information.

(2) *A division for regulation of coal prices* with the resposibility of fixing the normative price of coal based on the inputs provided by the technical division. The pricing formula should take into account all the different requirements listed above. Once again, this unit should be privy to all economic and commercial information from the concerned parties as might be required for carrying out its responsibilities.

(3) *A division for regulating exploration and mining acitivities* with the responsibility of allocating licences for exploring and mining. The following functions are to be performed: (a) fixing economic parameters for determination of the price/charges for exploration and mining of the identified blocks, (b) framing distortion free bid-evaluation critera to offer equal chances to every bidder, private or public, (c) deciding on the appropriate size of the mining blocks commensurate with the needs of the user in case of captive mining. Once again the base data will be supplied by the technical division.

(4) *A division for providing legal advice* with the responsibility of interfacing with the administrative and executive agencies involved in clearing the coal mining and prospecting projects. This division under direct supervision of the head of the organisation, will also undertake adjudication/arbitration in the event of disputes between all economic agents involved, i e, producer-producer, producer-consumer and producer-public, etc.

(5) In addition, there will be *divisions providing essential support services such as administration and finance management.* The proposed organisation may be a professional body with one overall in-charge and five divisional heads, appointed by the president of India and directly answerable to parliament. Alternatively, to make the body representative, it may have an additional tier above the core functional divisions, namely, a managing board consisting of the representatives of the producers, consumers, fiancial institutions, state and central governments.

VII
Concluding Remarks

Deregulation of the coal sector, by itself, may not lead to accelerated investment, expansion in production and competitive market conditions resulting in cost and price efficiency. Certain rigidities within the coal sector as also in the macro-economic environment imply that the gains of economic liberalisation can only be consolidated through the creation of a regulatory agency. This experience is not unique to India. Even the mature market oriented economies in the First World have come to accept the utility of such bodies in simulating competitive conditions under less than perfect free market conditions. The startegic importance of such bodies in hastening the process of economic growth has by now been established. These new bodies represent the latest extensions in the system of public administration all over the world. It is, therefore, expected that the Indian government should take stock of the situation and try to learn from the experience of other countries in the experiment of economic liberalisation
